☆U.S. GOVERNMENT PRINTING OFFICE: 1977-240-879/

CENTERS OF COMPETENCE AND THEIR SUBJECT COVERAGE

- Ground and surface water hydrology at the Illinois State Water Survey.

- Metropolitan water resources planning and management at the Center for Urban and Regional Studies of University of North Carolina.
- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Center of the University of Wisconsin.
- Eutrophication at the Water Resources Center of the University of Wisconsin.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.
- Water well construction technology at the National Water Well Association.
- Water-related aspects of nuclear radiation and safety at the Oak Ridge National Laboratory.
- Water resource aspects of the pulp and paper industry at the Institute of Paper Chemistry.

Supported by the Environmental Protection Agency in cooperation with WRSIC

- Effect on water quality of irrigation return flows at the Department of Agricultural Engineering of Colorado State University.
- Agricultural livestock waste at East Central State College, Oklahoma.
- Municipal wastewater treatment technology at the Franklin Institute Research Laboratories.

Subject Fields

- NATURE OF WATER
- WATER CYCLE
- WATER SUPPLY AUGMENTATION AND CONSERVATION
- WATER QUANTITY MANAGEMENT AND CONTROL
- WATER QUALITY MANAGEMENT AND PROTECTION
- WATER RESOURCES PLANNING
- RESOURCES DATA
- ENGINEERING WORKS
- MANPOWER, GRANTS, AND FACILITIES
- SCIENTIFIC AND TECHNICAL INFORMATION

INDEXES

- SUBJECT INDEX
- AUTHOR INDEX
- ORGANIZATIONAL INDEX

SELECTED WATER RESOURCES ABSTRACTS

The Library of the

OCT 14 1977

University of Illinois
at Urbana-Champaign

VOLUME 10, NUMBER 17
SEPTEMBER 1, 1977

W77-08101 -- W77-08600
CODEN: SWRABW

SELECTED WATER RESOURCES ABSTRACTS is produced by the Office of Water Research and Technology, U.S. Department of the Interior, and published twice monthly by the National Technical Information Service (NTIS), U.S. Department of Commerce, for the Water Resources Scientific Information Center (WRSIC).

SELECTED WATER RESOURCES ABSTRACTS (SWRA) is available to Federal agencies and their contractors or grantees in water resources research upon request, citing contract or grant number and sponsoring agency. Write: Manager, Water Resources Scientific Information Center, Office of Water Research and Technology, U.S. Department of the Interior, Washington, DC 20240.

Some documents abstracted in this journal can be purchased from NTIS. Price codes are given in the entries and a current code-price conversion table is attached to the outside back cover. Other documents are available from originating organizations or authors as indicated in the citation.

SELECTED WATER RESOURCES ABSTRACTS is also available on subscription from NTIS, 5285 Port Royal Road, Springfield, VA 22161. Annual subscription rates for the North American Continent are: SWRA Journal only, $75; Journal and Annual Indexes, $100; Indexes only, $50. Other addressees, write prices.

SELECTED WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center, Office of Water Research and Technology, U.S. Department of the Interior

VOLUME 10, NUMBER 17
SEPTEMBER 1, 1977

W77-08101 -- W77-08600

The Secretary of the U.S. Department of the Interior has determined that the publication of this periodical is necessary in the transaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through August 31, 1978.

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.

DEPOSITED BY THE U.S. DEPARTMENT OF THE INTERIOR

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifiers which are listed in the **Water Resources Thesaurus.** Each abstract entry is classified into 10 fields and 60 groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT PRESENTLY IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

Additional "centers of competence" have been established in cooperation with the Environmental Protection Agency. A directory of the Centers appears on the inside back cover

Supplementary documentation is being secured from established discipline-oriented abstracting and indexing services. Currently an arrangement is in effect whereby the BioScience Information Service of Biological Abstracts supplies WRSIC with relevant references from the several subject areas of interest to our users. In addition to Biological Abstracts, references are acquired from Bioresearch Index which are without abstracts and therefore also appear abstractless in SWRA. Similar arrangements with other producers of abstracts are contemplated as planned augmentation of the information base.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Research and Technology and other Federal water resource agencies with which the Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangements of this bulletin are welcome.

SUBJECT FIELDS AND GROUPS

Please use the edge index on the back cover to locate Subject Fields and Indexes.

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Nonwater Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

SELECTED WATER RESOURCES ABSTRACTS

1. NATURE OF WATER

1A. Properties

MEASUREMENT OF THE ATTENUATION OF ELECTROMAGNETIC RADIATION BY WATER IN THE VISIBLE REGION OF THE SPECTRUM,
Missouri Univ., Kansas City. Dept. of Physics.
P. G. Cary.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-267 916, Price codes: A05 in paper copy, A01 in microfiche. M.S. Degree, 1976. 69 p, 6 fig, 2 tab, 16 ref. OWRT A-091-MO(1), 14-34-0001-6026.

Descriptors: Attenuation, Measurement, *Electromagnetic waves, *Radiation, *Absorption, Methodology, Analytical techniques, Water properties.
Identifiers: *Attenuation coefficient(Water), Wave length region(418-640 nm).

The attenuation coefficient of water was measured for the 418-640nm wave-length region of the electromagnetic spectrum. The extinction coefficient of water was calculated from the attenuation coefficient. The use of a 5.Om long sample cell and a 0.25m long reference cell provided an attenuation path length of approximately 9.5m. A wavelength tuneable organic dye laser provided a source of quasimonochromatic electromagnetic radiation. The results were displayed graphically, tabulated, and compared to values reported by previous investigators. (Waring-Missouri)

APPLICATION OF THREE DAILY-RAINFALL RUNOFF MODELS TO FOUR AUSTRALIAN CATCHMENTS,
Monash Univ., Clayton (Australia). Dept. of Civil Engineering.
I. D. Moore, and R. G. Mein.
Research Report 3/76, May 1976. 48 p, 15 fig, 18 tab, 17 ref.

Descriptors: *Hydrology, *Australia, *Rainfall-runoff relationships, *Model studies, Streamflow, *Computer models, Synthesis, Watersheds(Basins), Surface runoff.
Identifiers: *Monash Model, *Boughton Model, *Stanford Watershed Model.

Three mathematical rainfall-runoff models, the Boughton Model, the Monash Model, and the Stanford Watershed Model, were applied to four rural catchments in Australia. The models were comparatively evaluated based on their data requirements, their computer processor time, their ability to predict streamflow, and the effort required by an independent user to achieve competence with the models. A split record technique was employed to calibrate and test the models. No one model performed better than any of the others in all cases. Results showed that the Monash and Stanford Models performed about equally well for daily flow prediction, and that all three gave comparable results for monthly flow prediction. Although the Boughton Model was inferior in predicting the daily flows, it had the advantage in that its data requirements were the most easily satisfied. It required less computer processor time, nd, in addition, it was conceptually the simplest model and was the easiest to operate. Although the Monash and Stanford Models were comparable in many respects, the routing routine in the Monash Model and the groundwater discharge routine in the Stanford Model appeared superior to the corresponding routines in the other models. Results also indicated the limitations of using daily inpuut data and models operating on daily time increments to predict daily streamflow. (Jones-ISWS)

REGIONAL SIMULATION OF STREAMFLOW DATA,
North Carolina Univ., Raleigh. Dept. of Biological and Agricultural Engineering.
E. H. Wiser.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-267 910, Price codes: A03 in paper copy, A01 in microfiche. Paper presented at ASAE Meeting, University of Nebraska, Lincoln, Nebraska, June 27-30, 1976. 38 p, 6 fig, 1 tab. OWRT B-064-NC(1), 14-31-0001-4112.

Descriptors: *Streamflow forecasting, *Computer models, *Computer programs, *Simulation analysis, Rainfall, Streamflow, River basins, Drainage basins, Model studies.
Identifiers: *Watershed models, Hydrologic Information Storage and Retrieval System(HISARS), Streamflow Synthesis and Reservoir Regulation(SSARR).

The North Carolina Streamflow Synthesis and Reservoir Regulation (NCSSARR) system was tested first in the Neuse River basin. Calibration runs were made on two watersheds, one in the Piedmont and the other in the Coastal Plain. On the basis of the parameter values thus obtained, parameters were estimated for all other subbasins, and simulation results obtained for a 25-year period at 123 points in the basin. Results were compared with measured flows at 16 gaging stations. The tests showed that the quantity of the flow was reliable, and the monthly totals agreed quite well, but timing of the flow was causing some problems and low flow estimates were too low to be useful. Watersheds with topographic conditions intermediate between the Piedmont and Coastal Plain also caused some problems. Potential applications of the system are considerable. It will be possible to estimate streamflow into the estuaries; to estimate streamflow at a point where a sewage treatment plant is proposed; to estimate the effect of interbasin transfers of water such as the proposed diversion of water from the Roanoke River to Norfolk; to determine the effect of alternate reservoir operating policies on downstream flow. THE EFFECTS OF URBANIZATION ON LOW FLOWS AND TOTAL RUNOFF,
Purdue Univ., Lafayette, Ind. School of Civil Engineering.
R. W. Shanks, and A. R. Rao.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-268 046, Price codes: A06 in paper copy, A01 in microfiche. Purdue University Water Resources Research Center, Lafayette Technical Report No. 94, May 1977, 101 p., 14 fig, 17 tab, 16 ref. OWRT C-6106(No. 5213) (1).

Descriptors: *Rainfall-Runoff relationships, *Urban runoff, *Urban hydrology, Storm runoff, Urban drainage, *Urbanization, *Low flow, Mass curves, Flow duration, Stream flow, Stream flow forecasting, Rainfall.
Identifiers: Linearized Model, 7-Day Low Flow, 1-Day Low Flow.

The objective was to investigate the effects of urbanization on the low flow and total runoff characteristics of streams. The data used in the analysis included the 1 and 7-day flows and total annual runoff sequences from six urban streams located throughout the United States. The observed flow sequences were analyzed by using mass curve analysis in order to determine the time at which changes in the flow sequence patterns took place. The year in which these changes became evident was then used to separate the flows into two groups. The period before the year of change represented the flows unaffected by the urbanization process. The period after the year of change represented the affected flows. In an attempt to explain these changes in the observed flow sequences, rainfall data were examined by similar mass curve methods. The rainfall characteristics remained approximatley the same through the periods of record. The rainfall-runoff relationships for each water shed were analyzed in order to determine the extent of the changes in the total annual runoff. The analysis was accomplished by linearizing the rainfall-runoff relationships by the transformation technique developed by Box and Cox. The slopes of the relationships for the unaffected and affected periods were compared to determine the magnitude of the changes which had taken place. Models of only the observed flows were also developed and analyzed.

DETERMINING AREAL PRECIPITATION IN THE BASIN AND RANGE PROVINCE OF SOUTHERN ARIZONA - SONOITA CREEK BASIN,
Arizona Water Resources Research Center, Tucson.
J. Ben-Asher, J. Randall, and S. Resnick.
In: Hydrology and Water Resources in Arizona and the Southwest, Proceedings of the 1976 meetings of the Amer. Water Resources Association, Arizona Section, and the Ariz. Academy of Science, Hydrology Section, Tucson, AZ., 4/28-5/1/76. 7 p, 6 fig, 5 ref. OWRT A-069-ARIZ(1), 14-34-0001-6003.

Descriptors: *Isohyets, Areal, *Precipitation(Atmospheric), *Arizona, *Simulated rainfall, Simulation analysis, Maps, Seasonal, Model studies.
Identifiers: *Areal precipitation, Four point interpolation, *Sonoita Creek basin(Ariz).

A linear relationship between point precipitation and elevation in conjunction with a computer four-point interpolation technique was used to simulate areal rainfall over Sonoita Creek Basin, Arizona. The simulation's sensitivity and accuracy were checked against the official isohyetal map of Arizona (1965) by changing the density of the interpolation nodes. The simulation was in good agreement with the official map. The average areal-rainfall was calculated by integration. Cumulative rainfall amounts were assumed to be stochastically independent from one season to another. The seasonal precipitations of forty years (1932-1972) were subdivided into five groups to check for binomial distribution. The binomial model fits the historical data adequately. The binomial model for cumulative seasonal areal-precipitation provides one way to compute the return period. This information will be necessary for decision-makers and hydrologists to predict the area's future water balance.

A NOTE ON THE STUDY OF RAINY DAYS AND WET SPELLS AT BIJAPUR,
University of Agricultural Sciences, Bangalore (India).
B. V. Rao Ramana, P. S. Kavi, and P. C. Sridharan.
Annals of Arid Zone, Vol 14, No 4, p 371-372, December, 1975.

Descriptors: *Frequency analysis, *Monsoons, *Wet seasons, *Rainfall, *Climatic data, Rain, Precipitation(Atmospheric), Meteorology, Meteorological data, Weather patterns, Thunderstorms, Storm, Probability.
Identifiers: *India(Bijapur).

Bijapur, located in the Indian state of Karnataka, has an annual rainfall of about 59 centimeters received mainly during the months April to December. The daily rainfall data collected at Bijapur for all years from 1921 to 1970 were analyzed to study the distribution of rainy days and wet spells during these months. The frequencies of wet spells of different lengths are estimated monthwise using logarithmic series and the results are discussed. It was found that the southwest monsoon rains persist more in the month of September. Although the probability of occurrence of a rainy day is less during November than in the months of April and May, the persistency is more in November than in April and May. (Jamail-Arizona)

2C. Snow, Ice, and Frost

THE AFGWC SNOW COVER ANALYSIS MODEL,
Air Force Global Weather Central, Offutt AFB, Nebr.
S. A. Luces, S. J. Hall, and J. D. Martens.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A017 942, Price codes: A03 in paper copy, A01 in microfiche. Report AFGWCTM 75-1, June 1975. 22 p, 1 tab, 12 ref, 3 append.

Descriptors: *Snow cover, *Mathematical models, *Computer programs, Analytical techniques, Numerical analysis, Weather data, Remote sensing, Satellites(Artificial), Snow, Sea ice, Climatology, Data collections, Climatic data, Computers, Weather, Model studies, Meteorology.
Identifiers: *Snow cover analysis.

This report documented the Air Force Global Weather Central (AFGWC) Automated Snow Cover Analysis Model. It described the data input, analysis procedures, problems, possible improvements, and potential uses of the model. The hemispheric model became operational in March 1975. It uses hourly surface synoptic data, meteorological satellite video brightness data, and climatological data to determine the depth and age of snow on the ground on a hemispheric grid with 25 nautical miles spacing. The resulting daily analyses provide a Northern Hemisphere data base which is stored on high speed computers and is available for many meteorological and other scientific applications. (Sims-ISWS)
W77-08223

VERTICAL STRAIN-RATE MEASUREMENTS IN AN ARCTIC ICE CAP AND DEDUCTIONS FROM THEM,
Department of Energy, Mines, and Resources, Ottawa (Ontario). Polar Continental Shelf Project.
W. S. B. Paterson.
Journal of Glaciology, Vol. 17, No. 75, p 3-12, 1976. 4 fig, 1 tab, 22 ref.

Descriptors: *Ice, *Strain measurement, *On-site tests, *Glaciology, *Arctic, Strain, Velocity, Movement, Measurement, On-site investigations, Rheology, Dating, Analytical techniques, Analysis, Mechanical properties.
Identifiers: *Devon Island Ice Cap(Canada), Ice cap.

Closely spaced measurements of diameter of thermally drilled boreholes revealed a pattern of small variations. The patterns served to identify points on the borehole wall; thus the change in length of sections of borehole can be determined as a function of time. The method was used to measure vertical strain-rate as a function of depth in two boreholes near the crest of the Devon Island ice cap. The measured strain-rate, corrected for firn compaction, varied significantly with depth. The vertical component of velocity at the surface was determined from the contraction rate of a borehole that penetrated to the base of the ice. Comparison of this velocity with the present accumulation rate suggested that the ice cap, in the vicinity of the bore-hole, is thickening slightly at present. The age of the ice at various depths, as calculated from the measured vertical velocities, is in broad agreement with radiocarbon dates covering the past 6000 years, which suggests that the flow of the ice cap has not varied significantly over this period. Thus the present accumulation rate, which is causing thickening, must be slightly above the average for the period. (Humphreys-ISWS)
W77-08226

RESURVEY OF THE 'BYRD' STATION, ANTARCTICA, DRILL HOLE,
Cold Regions Research and Engineering Lab., Hanover, N.H.
D. E. Garfield, and H. T. Ueda.
Journal of Glaciology, Vol. 17, No. 75, p 29-34, 1976. 5 fig, 4 ref.

Descriptors: *Drill holes, *Ice, *Surveys, *Antarctic, On-site investigations, On-site tests, Movement, Instrumentation, Measurement, Slopes, Analysis.
Identifiers: *Byrd Station, Inclinometer, Azimuth.

The drill hole at 'Byrd' station, which was completed in January 1968 to a vertical depth of 7063 ft (1253 m) below the top of the hole casing, was resurveyed in January 1975 to a vertical depth of 4835 ft (1474 m). Inclination and azimuth measurements were made with a Parsons multiple shot inclinometer and were compared with the earlier measurements made during drilling. The results indicated a progressively increasing displacement with depth to a value of 51.2 ft (15.6 m) or about 7.3 ft/year (2.23 m/year) at the 4835 ft (1474 m) level. The direction of movement relative to the surface varies from southwest at 300 ft (91.5 m) to northeast at 1100 ft (335 m) to east at 3368 ft (1027 m) to northeast at 4835 ft (1474 m), indicative of a complex twisting motion. An increase in accessible depth along the hole axis of 18 ft(5.49 m) beyond the 1969 depth was noted. No attempt was made to measure hole diameter or vertical strain. It was recommended that the hole be resurveyed in 3-5 years if it is still logistically feasible, using a more updated inclinometer. (Humphreys-ISWS)
W77-08227

A FURTHER COMPARISON OF GLACIER VELOCITIES MEASURED BY RADIO-ECHO AND SURVEY METHODS,
British Antarctic Survey, Cambridge (England).
C. S. M. Doake, M. Gorman, and W. S. B. Paterson.

Journal of Glaciology, Vol. 17, No. 75, p 35-38, 1976. 1 fig, 7 ref.

Descriptors: *Ice, *Surveys, *Glaciology, *On-site tests, *Arctic, On-site investigations, Velocity, Glaciers, Measurement, Instrumentation, Radar, Remote sensing, Drill holes, Evaluation, Sounding.
Identifiers: *Devon Island Ice Cap(Canada), Ice cap, Radio-echo survey.

A comparison was made between ice velocities that were measured by the radio-echo technique and ice velocities measured by a survey method on the Devon Island ice cap, Arctic Canada. Results were 2.58 + or - 0.11 m/a by radar and 2.17 + or - 0.20 m/a by survey. The discrepancy between the two measurements is within the limits of statistical significance, and the methods were considered to give comparable results. (Humphreys-ISWS)
W77-08228

RADIO-ECHO SOUNDING OF TEMPERATE GLACIERS: ICE PROPERTIES AND SOUNDER DESIGN CRITERIA,
Geological Survey, Denver, Colo.
R. D. Watts, and A. W. England.
Journal of Glaciology, Vol. 17, no. 75, p 39-48, 1976. 5 fig, 5 ref.

Descriptors: *Glaciers, *Sounding, *Electromagnetic waves, Glaciology, Design criteria, Instrumentation, Theoretical analysis, Mathematical studies, Remote sensing, Radio waves.
Identifiers: *Radio-echo sounding, Temperate glaciers, Scattering theory, Back-scattering.

This is the first paper in a two-part series which describes the design, operation, and testing of a successful 5 MHz radio-echo sounder for temperate glaciers. The first part dealt with the electromagnetic characteristics of temperate glaciers at radio frequencies. Earlier workers' problems in sounding through temperate ice were explained in terms of electromagnetic scattering by water-filled voids. The frequency dependence of the scattering indicates that returns from scatterers diminish rapidly at frequencies below about 10 MHz. A system with the following characteristics was recommended: a transmitted pulse with a center frequency of about 5 MHz, duration of about 1 cycle, and a receiver which is untuned and which measures field intensity rather than power. Spectral methods for studying the size distribution of scatterers were presented. (Humphreys-ISWS)
W77-08229

RADIO-ECHO SOUNDING: REFLECTIONS FROM INTERNAL LAYERS IN ICE SHEETS,
Wisconsin Univ. Middleton. Geophysical and Polar Research Center.
J. W. Clough.
Journal of Glaciology, Vol. 18, No. 78, p 3-14, 1977. 4 fig, 19 ref. NSF OPP72-05802.

Descriptors: *Glaciers, *Remote sensing, *Radio waves, *Antarctic, Reflectance, Ice, Snow, Cores, Physical properties, Polar regions, Cold regions, Glaciology.
Identifiers: *Ice sheets, *Byrd Station, *Radio-echo sounding, Radio-echo reflections, Internal layers, Internal reflections, Permittivity, Layers.

The origin and nature of radio-echo internal reflections were the subjects of much debate. Calculations of single- and multiple-layer reflection coefficients for dielectric changes in the ice sheet indicated that the observed relection strength may result from reflections many thin layers, but the zone of thin layers may best be approximated by replacing the zone with a single thicker layer with average dielectric properties. Calculation of reflections from density changes, dust and dirt bands, and anisotropy of permittivity indicated density variations as the most likely cause of the internal layering in the uppermost kilometer of ice sheets. Comparison of the depth of internal reflections at 'Byrd' station, Antarctica, with the physical properties of the ice measured in a deep core hole at that location supported the conclusion. (Sims - ISWS)
W77-08230

A NEW CLIMATIC MODEL FOR GLACIER BEHAVIOR OF THE AUSTRIAN ALPS,
Rider Coll., Trenton, N.J. Dept. of Geosciences.
H. W. Posamentier.
Journal of Glaciology, Vol. 18, No. 78, p 57-65, 1977. 3 fig, 1 tab, 18 ref.

Descriptors: *Glaciers, *Climatic data, *Model studies, Mathematical models, Ablation, Temperature, Air temperature, Precipitation(Atmospheric), Regression analysis, Correlation analysis, Mountains, Ice, Weather, Weather data, Meteorological data, Glaciology, Meteorology, Foreign countries.
Identifiers: *Austria.

Two climatic models were proposed for the fluctuation of Austrian Alpine glacier termini. The glacier record, based on annual observations by the Osterreichische Alpenverein, is related to climatological data from the high-elevation Sonnblick-Observatorium. The variables used in this analysis were monthly mean temperature and total precipitation during the ablation season for the concurrent plus preceding eleven years. The preferred model, mean temperature for June, July, and August for the concurrent plus preceding seven years, is inversely related to glacier advance. This model was derived by combining those variables with the highest correlation coefficient relative to the glacier record. Mean lag time between climate and glacier termini response seems to be seven years. The second and less preferred model was derived by multiple regression analysis and includes seven variables of temperature and precipitation. Variation in the glacier behavior record accounted for by the two models is 71% and 67%, respectively. (Sims-ISWS)

STRESS IN AN ELASTIC BEDROCK HUMP DUE TO GLACIER FLOW,
University of East Anglia, Norwich (England). School of Mathematics and Physics.
L. W. Morland, and E. M. Morris.
Journal of Glaciology, Vol. 18, No. 78, p 67-75, 1977. 10 fig, 6 ref.

Descriptors: *Glaciers, *Bedrock, *Stress, Flow, Ice, Loads(Forces), Strain, Model studies, Mathematical models, Failures, Rocks, Glaciology.
Identifiers: *Bedrock humps, Glacial flow.

The stress field is an isotropic elastic hump representing a typical bedrock feature was obtained for plane strain conditions. Gravity effects were included, and the applied load is a normal pressure distribution deduced from an idealized model of glacier flow. A Coulomb failure criterion was applied, including (1) the effective stress change due to pore water pressure, and (2) stresses on the predicted failure planes determined for different pressure amplitudes and relative gravity contributions. The latter make little difference to the maximum 'failure stress', but they influence the regions where such stress levels occur. Levels of cohesive stress required to inhibit Coulomb failure were obtained and in general, were low, implying that coherent rock in the adopted hump profile, subject to the model pressure, would not fail. This profile is stable unless jointing introduces an easier failure mechanism. (Sims-ISWS)

IMPURITY CONCENTRATIONS IN SEA ICE,
McGill Univ., Montreal (Quebec). Dept. of Physics.
J. R. Addison.
Journal of Glaciology, Vol. 18, No. 78, p 117-127, 1977. 6 fig, 1 tab, 26 ref.

Descriptors: *Sea ice, *Chemical analysis, *Laboratory tests, *Testing, Analysis, Analytical techniques, Ions, Profiles, Distribution patterns, Saline water, Melt water, Sampling, Ice, Chemicals, Chlorides, Sulphates, Sodium, Potassium, Magnesium, Calcium.
Identifiers: Ion concentrations.

Three different types of saline ice were cut into sections a few millimeters thick along planes parallel to the surface. The resulting melts were analyzed quantitatively for chloride, sulphate, sodium, potassium, magnesium, and calcium. Two of the specimens were artificial sea ice, grown in the laboratory at ambient temperatures of -30 C and -15 C, respectively. A portion of the latter exhibited a clear, glassy, fresh-ice structure. The third specimen was natural sea ice. The resulting ion concentration profiles and ion ratios were presented. For sections of widely varying salinity, the various ion ratios assumed values fairly close to those in natural seawater. (Humphreys-ISWS)

MEASUREMENT OF ICE MOVEMENT IN SUB-GLACIAL CAVITIES: A NEW CAVITOMETER BENEATH THE GLACIER D'ARGENTIERE (MT BLANC, FRANCE),
Grenoble-1 Univ. (France). Institut de Geographie Alpine.
G. Bocquet, and J. C. Ricq.
Journal of Glaciology, Vol. 18, No. 78, p 137-142, 1977. 4 fig, 3 ref.

Descriptors: *Glaciers, *Movement, *Instrumentation, Equipment, Mechanical equipment, Electrical equipment, Measurement, Surveys, Ice, Foreign countries, Foreign research, Engineering, Glaciology.
Identifiers: *Cavitometers, *France, *Glacier d'Argentiere(France), Glacial flow, Subglacial cavities.

The study of subglacial movements taking place in regions of cavitation beneath the Glacier d'Argentiere demonstrated the necessity for using several cavitometers. The very unusual conditions in which such apparatus is installed to measure simultaneously the velocity and the position of the ice vault led to the design and production of a prototype of a portable cavitometer which records the data on magnetic tape (cassettes). (Sims-ISWS)

ON DEPTH HOAR AND THE STRENGTH OF SNOW,
Montana State Univ., Bozeman. Dept. of Earth Sciences.
C. C. Bradley, R. L. Brown, and T. Williams.
Journal of Glaciology, Vol. 18, No. 78, p 145-147, 1977. 6 ref. AROD DA-ARO-D-31-124-71-G59, NSF FA-3943.

Descriptors: *Snow, *Snowpacks, *Frost, Strength, Mechanical properties, Bearing strength, On-site investigations, Temperature, Thermal conductivity, Snow cover, Crystals.
Identifiers: *Depth hoar, Snow strength, Metamorphism, Recrystallization, Geothermal heat.

It has long been known that a temperature gradient in the snowpack, when temperatures are less than O C, can metamorphose the snow to produce a fragile euhedral crystalline end product called 'depth hoar' which is considered to be responsible for snowpack collapse and climax avalanches. The wave of metamorphism advancing through anhedral snow converts it first to subhedral, and finally to euhedral, depth hoar. Field observations, which are at the moment supported by laboratory

evidence, revealed that the zone of minimum snow strength in the gradient metamorphic layer is associated with the intermediate subhedral phase rather than with the euhedral end product. (Sims-ISWS)

RELOCATION OF BURIED MARKERS,
British Columbia Univ., Vancouver. Dept. of Geological Sciences.
W. H. Mathews.
Journal of Glaciology, Vol. 18, No. 78, p 150-151, 1977. 2 ref.

Descriptors: *Stations, *Relocation, *Remote sensing, *Glaciers, Instrumentation, Sites, Glaciology, Electronic equipment, On-site Investigations.
Identifiers: *Buried markers, Electromagnetic detector.

Success was achieved in relocating wire netting which had been covered by a year's net accumulation of snow on Berendon Glacier. A signal produced by a wire loop tuned to respond to a 15 kHz electromagnetic output was detected readily by a hand-held, battery-powered electromagnetic detector. Sextant readings on fixed landmarks around the glacier aided in locating the search area. (Humphreys-ISWS)

THE FLOODING OF RIVERS IN THE USSR AND THE MEASURES TAKEN TO CONTROL ICE JAMS (LES INONDATIONS FLUVIALES EN URSS ET LA LUTTE CONTRE LES CRUES CAUSEES PAR LES EMBACLES),
Akademiya Nauk SSSR, Moscow. Institut Vodnykh Problem.
K. S. Lubomirova.
In: Flash Floods; Proceedings of the Paris Symposium, September 1974: International Association of Hydrological Sciences Publication No. 112, p 110-113, 1974. 5 ref.

Descriptors: *Floods, *Ice jams, *Rivers, *Reservoirs, Ice, Flooding, Reservoir operation, Hydroelectric plants, Frazil ice, Ice breakup, Foreign countries, Foreign research.
Identifiers: *USSR.

The flooding of streams and rivers of different regions of the USSR is classified according to the cause of the flood. The time lag involved in the breaking up of ice in rivers and reservoirs often causes ice jams and frazil ice in upstream reaches of the reservoirs, which results in high stages. Similar situations are found on rivers which have constrictions, tight bends, etc. However, in the described case, the places where ice jams are most likely to occur are known and so preventive measures can be taken. In order to control the ice regime downstream from reservoirs which are linked to large rivers, it was recommended that large amounts of warm water should be injected. It was proposed that at the time of constructing the cascades of hydrological power plants situated on rivers subjected to ice jams, the outflows should be made to open in succession upstream and downstream. Therefore, it would be possible to control the ice regime over a large river reach as power plants need only be constructed on every other cascade. (See also W77-01933) (Humphreys-ISWS)

COMBINED ICE AND WATER BALANCES OF MACLURE GLACIER, CALIFORNIA, SOUTH CASCADE GLACIER, WASHINGTON, AND WOLVERINE AND GULKANA GLACIERS, ALASKA, 1967 HYDROLOGIC YEAR,
Geological Survey, Anchorage, Alaska. Water Resources Div.
W. V. Tangborn, L. R. Mayo, D. R. Scully, and R. M. Krimmel.
Available from Supt. of Documents, GPO, Washington, D.C., 20402, price $3.90. Professional Paper 715-B, 1977. 20 p, 9 fig, 4 plates, 8 tab, 14 ref.

Descriptors: *Glaciers, *Ice, *Water balance, *Snowmelt, *International Hydrological Decade, *California, *Washington, *Alaska, Snowpacks, Snow cover, Abltation, Runoff, Melt water, Hydrologic cycle, Climatology, Cold regions, Mountains.
Identifiers: *Maclure Glacier(Calif), *South Cascade Glacier(Wash), *Wolverine and Gulkana Glaciers(Alaska).

Combined ice and water balances were measured in the 1967 hydrologic year (October 1-September 30) on four glaciers in western North America ranging in latitude from 37 degrees to 63 degrees N. This hydrologic year was characterized by heavier than normal winter precipitation in California and Washington and abnormally dry winter conditions in coastal Alaska. In summer the western conterminous states were abnormally dry and central and southern Alaska experienced very wet conditions. Maclure Glacier (lat 37 deg 45 min N., 3,650-m (meters) mean equilibrium line altitude) had an above normal winter balance of 3.46 m and a positive annual balance of 1.05 m (meters of water equivalent). South Cascade Glacier (lat 48 deg 22 min N., 1,900-m mean equilibrium line altitude) had a winter balance of 3.28 m, slightly above average. Above normal summer ablation resulted in a final annual balance of -0.58 m, slightly more negative than has been the case for the past decade. Wolverine Glacier's (lat 60 deg 24 min N., 1,200-m mean equilibrium line altitude) winter balance was 1.17 m, considerably below normal; the annual balance was -2.04 m. Gulkana Glacier (lat 63 deg 15 min N., 1,700-m mean equilibrium line altitude) had a winter balance of 1.05 m, approximately normal for this glacier; the final annual balance was -0.3-0 m. (Woodard-USGS)

2D. Evaporation and Transpiration

ESTIMATING EVAPOTRANSPIRATION IN THE NORTH PLATTE BASIN OF WYOMING,
Wyoming Univ., Laramie. Dept. of Agricultural Engineering.
R. W. Van Klaveren.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-268 623, Price codes: A03 in paper copy, A01 in microfiche. M.S. Thesis, June 1975. 60 p, 8 tab, 32 fig, 22 ref. OWRT A-014-WYO(1), 14-31-0001-5051.

Descriptors: *Evapotranspiration, *Phreatophytes, Methodology, *Consumptive use, *Wyoming, River basins, Estimating, Water utilization.
Identifiers: *Potential evapotranspiration, *North Platte River Basin(Wyo).

Methods of calculating potential evapotranspiration were compared and estimates of phreatophyte water use were made for the North Platte River Basin of Wyoming. Three methods of estimating potential evapotranspiration, the Jensen-Haise, Thornthwaite, and Blaney-Criddle, were evaluated and compared to adjusted pan evaporation. By a simple modification of the Thornthwaite equation, the most favorable correlation of potential evapotranspiration with pan data was acquired. Average annual phreatophyte evapotranspiration was estimated using the Blaney-Criddle method. The estimated total long-term annual evapotranspiration for phreatophytes was 8,121 hectare-meters for the four major rivers consisting of the North Platte, Laramie, Medicine Bow, and Sweetwater.

2E. Streamflow and Runoff

MEASUREMENT OF FLASH FLOODS IN THE UNITED STATES--STATE OF THE ART,
Geological Survey, Reston, Va. Water Resources Div.
H. H. Barnes, Jr.
In: Flash Floods; Proceedings of the Paris Symposium, September 1974: International Association of Hydrological Sciences Publication No 112, p 48-51, 1974. 10 ref.

Descriptors: *Floods, *Measurement, *Analytical techniques, *Reviews, Stream gages, Instrumentation, Crest-stage gages, Current meters, Culverts, Indirect flood measurement, Hydrographs, Discharge(Water), Flow rates, Mannings equation, Computer programs, United States.

During the past two decades the US Geological Survey has devoted a significant part of its total water resources appraisal effots to the measurement of floods in small basins. On the most important considerations in the development of all the State programs is the difficulty in measuring flood discharges. Most of the floods which occur at station sites over a large part of the country are produced by severe thunderstorm activity of limited areal extent. The inability to forecast the time and place of occuurrence of storms in advance, and the short time of concentration and storm duration, limits the probability of obtaining conventional current-meter measurements. As a consequence the changes in philosophy, instrumentation, equipment, and operational procedures during this period have been significant. This paper reviews the changes which have occurred during the past 20 years, and describes current practices employed in the measurement of floods. (See also W77-01933) (Woodard-USGS)

SIMULATION OF STREAMFLOW OF FLAMBEAU RIVER AT PARK FALLS, WISCONSIN TO DEFINE LOW-FLOW CHARACTERISTICS,
Geological Survey, Madison, Wis. Water Resources Div.
W. R. Krug.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-265 353/AS, Price codes: A02 in paper copy, A01 in microfiche. Water-Resources Investigations 76-116, December 1976. 14 p, 7 fig, 2 tab, 4 ref.

Descriptors: *Streamflow forecasting, *Routing, *Low flow, *Simulation analysis, *Flow characteristics, Computer models, Open channel flow, Analytical techniques, Evaluation, *Wisconsin.
Identifiers: *Flambeau River(Wis), Park Falls(Wis).

Daily streamflows of the Flambeau River at Park Falls, Wisconsin, were simulated for a 31-year period. Streamflow was simulated using a streamflow-routing model. These simulated daily flows were analyzed for summer (June 1-October 31) low-flow frequency. The resultant 7-day, 10-year summer low flow is 260 cubic feet per second. The standard error of estimate for this 10-year-frequency low flow is equivalent to the standard error of estimate for 16 years of gaging-station records. (Woodard-USGS)

EFFECTS OF MEANDERING IN ALLUVIAL STREAMS,
Battelle-Pacific Northwest Labs. Richland, Wash.
Y. Onishi, S. C. Jain, and J. F. Kennedy.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol. 102, No. HY7, Proceedings Paper 12248, p 899-917, July 1976. 6 fig, 3 tab, 19 ref, 3 append. OWRT A-029-IA(5), USDA-ARS 12-14-100-104(38).

Descriptors: *Meanders, *Alluvial channels, *Sedimentation, *Beds, Channels, Curves, Erosion, Friction, Open channel flow, Rivers, Equations, Sediment transport.
Identifiers: *Alluvial streams, *Bed forms, Bends(Hydraulic), Friction factor, Secondary flow, Sediment deposits, Meandering channel, Sediment transfer.

For a given mean depth and velocity of flow, the sediment discharge per unit width in the full-width meandering channel was found to be greater than that in the straight flume, which in turn was greater than that of the half-width meandering channel. The bend-loss coefficient, defined as the head loss (plus or minus) due only to channel curvature normalized by the mean-velocity head, increased with Froude number, the ratio of bed hydraulic radius to median sand diameter, and the ratio of width to center line radius of curvature. At the smaller depths investigated, the friction factors of the sinuous channel flows were less than those of the straight channel flows. These effects apparently resulted primarily from the large changes produced in the bed configurations by the secondary flows. (Roberts-ISWS)

FLASH FLOODS IN THE WESTERN MEDITERRANEAN (LES CRUES CATASTROPHIQUES SUR LA MEDITERRANEE OCCIDENTALE),
Servicio Meteorologico Nacional, Madrid (Spain).
J. Miro-Granada y Gelabert.
In: Flash Floods; Proceedings of the Paris Symposium, September 1974: International Association of Hydrological Sciences Publication No. 112, p 119-132, 1974. 11 fig, 9 ref.

Descriptors: *Flash floods, *Weather patterns, *Meteorology, *Rainfall disposition, Historic floods, Precipitation(Atmospheric), Precipitation excess, Rainfall, Runoff, Orography, Isohyets, Analysis, Analytical techniques, Synoptic analysis, Foreign research, Foreign countries.
Identifiers: *Spain.

Along the Spanish Mediterranean coast, the rivers have short, steep gradients and, due to the semiarid climate, are often dried up or have only low discharges. Flash floods occur in this area principally in the autumn because during autumn, extensive storm nuclei build up, resulting in extremely heavy rainfall. The storm nuclei form because the Mediterranean is a source of heat energy and water vapor and because well-developed convective cells prevail, together with some other characteristic meteorological conditions. The flood of October 1973 on the southeast coast of Spain was studied. The genesis of the phenomenon is considered to be the coincidence of several factors: the maximum temperature of the shallow coastal seawater; a zone of air flow forked into two branches, one crossing the western Mediterranean from the southwest; and the orographical characteristics of the basin. The result was a divergence at 500 mb with a southwest flow and convergence at surface level where there were easterly winds. A vortex with a horizontal axis was set up. Comparisons were made between the storm rainfall and the average annual precipitation. It was shown that both the rain gauge and synoptic networks were inadequate to detect such nuclei so that flood warnings can be issued and possible damage minimized. The use of radar station sites was discussed. (See also W77-01933) (Humphreys-ISWS)

FLASH FLOODS IN SPAIN (LES CRUES BRUTALES EN ESPAGNE),
Consejo Superior di Investigaciones Cientificas, Madrid (Spain). Instituto de Hidrologia.
R. Heras.
In: Flash Floods; Proceedings of the Paris Symposium, September 1974: International Association of Hydrological Sciences Publication No. 112, p 93-99, 1974. 5 fig, 1 tab, 4 ref.

Descriptors: *Flash floods, *Flood discharge, *Watersheds(Basins), *Analytical techniques, Analysis, Rainfall excess, Precipitation(Atmospheric), Meteorology, Statistical methods, Rainfall disposition, Runoff, Foreign countries, Foreign research.
Identifiers: *Spain.

Because of the immense irregularity of Spanish rivers, there is a large contrast between critically small low flows and maximum flood discharges as great as, and even greater than, the greatest floods recorded in Europe. The River Duero flood in 1909 may be one of the best known in western Europe for basins exceeding 1000 sq. km. The flood of small basins in the Mediterranean region and the Canary Isles are of the same magnitude as the most severe ones in the world. In view of the complexity of the maximum flood phenomenon, in particular the sudden, severe, catastrophic ones that occur in small basins, it is difficult to estimate the distribution of maximum precipitation and flood discharges using hydrological-statistical methods. The difficulty exists because the phenomena happen at irregular intervals in vast zones both on the Spanish mainland and on the Islands of Spain. However, using all existing information, including historical data, which in some cases have been recorded for more than 300 years, the distribution laws were obtained by using direct, empirical, statistical and hydrometric methods. THE OPERATION OF A FLOOD WARNING NETWORK: ITS USE FOR STUDYING FLASH FLOODS (EXPLOITATION D'UN RESEAU D'ALERTE: SON UTILISATION POUR L'ETUDE DES CRUES BRUTALES),
Division des Resources en Eau, Tunis (Tunisia).
H. Zebidi, and R. Kallel.
In: Flash Floods; Proceedings of the Paris Symposium, September 1974: International Association of Hydrological Sciences Publication No. 112, p 57-61, 1974. 1 fig.

Descriptors: *Warning systems, *Flash floods, *Networks, *Africa, Forecasting, Hydrologic data, Watersheds(Basins), Flood forecasting, Communication, Radio communication, Foreign countries.
Identifiers: *Tunisia, Wadis, *Flood warning networks.

The dry climate which is found in most of Tunisia takes the form of particularly irregular flow patterns on the hydrographic network. The flow patterns are characterized by very low water levels and by sudden and violent floods. In addition to the difficulties of measuring the flood, devastating effects also result on the coastal plains and in the low zones which are crossed by the different wadis. Therefore, it was necessary to create a flood warning network, parallel to the hydrometric network, so that the different gauging stations can be reached in the time, and so that the civil authorities might be warned in time to avoid flood damage and loss of life. Of course, the flood warning network is always in direct contact with the Dam Control Service. The flood warning network operates by means of two-way radio contact as well as through a telephone link between the Central Bureau of Tunis (which is always open) and regional bureaus, which assemble the data from different basins and hydrometric stations set up at the nerve centers of the different wadis of the country. A METHODOLOGY FOR MEASURING FLASH FLOODS (METHODOLOGIE POUR LA MESURE DES CRUES BRUTALES),
Office de la Recherche Scientifique et Technique Outre-Mer, Paris (France).
J. Cruette.
In: Flash Floods; Proceedings of the Paris Symposium, September 1974: International Association of Hydrological Sciences Publication No. 112, p 34-43, 1974. 2 fig, 1 append.

Descriptors: *Flash floods, *Measurement, *Methodology, Organizations, Gaging stations, Sites, Flood discharge, Discharge(Water), Topography, Watersheds(Basins), Analytical techniques, Foreign countries, Foreign research.
Identifiers: *France, Flow charts.

Measuring flash floods is a very difficult operation, particularly when the greatest discharges are considered. With the aid of his own experience in this field, the author has tried to build a specific methodology. The methodology consists of a perpetual research into the best possible organization. All the operations retained for every elementary task are reconsidered systematically as soon as a new event brings supplementary information. The described approach was illustrated by two flow charts. Experience has shown also that all the measuring techniques used in the case of the most regular regimes have to be revised. In order to show the significance of the methodology, it was essential to mention some especially important points of the procedure. (See also W77-01933) (Humphreys-ISWS)

EFFECT OF LATERAL INFLOW ON STEADY OPEN CHANNEL FLOWS,
Connecticut Univ., Storrs.
H. K. Soong.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-267 925, Price codes: A06 in paper copy, A01 in microfiche. Ph.D. Dissertation, 1976. 104 p, 8 tab, 29 fig, 28 ref. OWRT A-051-CONN(2), 14-31-0001-3507.

Descriptors: *Open channel flow, *Flow characteristics, *Momentum equation, *Energy equation, *Nonuniform flow, *Energy loss, Design.
Identifiers: *Lateral inflow, *Streamwise variation, Mixing loss, Design methods.

By a critical examination of one-dimensional open channel flow analysis, it can be shown that a single momentum or energy equation as widely used in the past is not sufficient to explain certain anomalies in the nonuniform flow region. Additional equations are necessary for evaluating energy and mixing losses. In this study these equations are developed and shown to be satisfactory in matching exprimental results. Furthermore, the streamwise variation of momentum and energy correction factors determined from the following two methods: (1) a direct numerical integration of momentum and energy flux across a section of open channel, obtained from the measured velocity distributions, and (2) a numerical solution of the momentum and energy equations for the correction factors, utilizing the flow variable derived from experimental data, is shown to be a pertinent parameter for the nonuniform flow field. The results should further the understanding of the flow behavior in the mixing region and provide a scheme of open channel flow analysis to improve design methods. (de Lara-Connecticut)

SMALL-STREAM FLOOD INVESTIGATIONS IN MINNESOTA, OCTOBER 1958 TO SEPTEMBER 1975,
Geological Survey, St. Paul, Minn. Water Resources Div.
L. C. Guetzkow, and K. T. Gunard.
Open-file report 77-39, December 1976. 161 p, 8 fig, 1 tab.

Descriptors: *Flood data, *Small watersheds, *Minnesota, *Peak discharge, Design criteria, Drainage systems, Road construction, Hydrologic data, Gaging stations, Streamflow, Flow characteristics, Stage-discharge relations.
Identifiers: *Basin characteristics.

An investigation of flood flows from small drainage basins in Minnesota was initiated to aid in the design of bridges, culverts and other highway drainage structures. The program provides peak flow data on streams having drainage areas generally less than 50 square miles, placing particular emphasis on those less than 10 square miles. Basin parameters being investigated are drainage area, length of main stream, slope of main channel, basin altitude, forest cover, and storage area. Each of the 138 gaging stations are equipped with crest-stage gages, and 10 stations have continuous recorded records of stage and precipitation. The relative magnitude of flood flows for different hydrologic regions are shown in graphs which relate maximum discharge to drainage area. Each station record contains location, drainage area, records available, type of gage, on-site structure elevations, bankfill stage, and annual maximum stage and discharge data. (Woodard-USGS)

ANNUAL PEAK DISCHARGES FROM SMALL DRAINAGE AREAS IN MONTANA THROUGH SEPTEMBER 1976,
Geological Survey, Helena, Mont. Water Resources Div.
M. V. Johnson, R. J. Omang, and J. A. Hull.
Open-file report 77-172, March 1977. 204 p, 2 fig.

Descriptors: *Annual peak discharge, *Small watersheds, *Floods, *Montana, Crest-stage gages, Streamflow, Surface runoff, Design criteria, Highways, Hydrologic data.

Annual peak discharge from small drainage areas is tabulated for 336 sites in Montana. The 1976 additions included data collected at 206 sites. The program which investigates the magnitude and frequency of floods from small drainage areas in Montana, was begun July 1, 1955. Originally 45 crest-stage gaging stations were established. The purpose of the program is to collect sufficient peak-flow data, which through analysis could provide methods for estimating the magnitude and frequency of floods at any point in Montana. The ultimate objective is to provide methods for estimating the 100-year flood with the reliability needed for road design. (Woodard-USGS)

Hydraulic conductivity, Transmissivity, Groundwater recharge, Specific gravity.
Identifiers: *Englishtown formation(NJ), Specific storage.

The geohydrologic data in this report are the basic requirements needed in the development of a computer simulation model of the most developed part of the Englishtown aquifer in the northern Coastal Plain of New Jersey. The Englishtown aquifer, which has an average thickness of about 100 feet throughout Monmouth and northern Ocean Counties, is sandwiched between overlying and underlying confining beds that have an average thickness of 40 ft and 200 ft respectively. The transmissivity of the aquifer is relatively low, ranging from 2,400 sq ft/d to 650 sq ft/d; the hydraulic conductivity averages about 15 ft/d. The average rate of withdrawal study increased from 5.5 mgd in 1959 to about 9.5 mgd in 1970. The effect of this withdrawal rate was a decline in head as of 1970 at a rate of 8 to 12 ft per year over large areas. As a consequence of this change in head, large quantities of water have apparently leaked from and through the confining layers into the Englishtown aquifer. The quantity of leakage and the effects of future stresses on the aquifer can best be estimated by simulation modeling. (Woodard-USGS)

Petrographic analysis of 14 cores penetrating the Inglis and Avon Park Formations (Floridan aquifer) reveals several distinct lithofacies representing multiple regressive-transgressive cycles, aerial exposure, and diagenesis. Evolution of pore space varies with the lithofacies and is a function of primary deposition and diagenetic history. The general tendency has been toward obliteration of primary voids by compaction and calcite and dolomite infilling, but several zones show dissolution enlargement. There is evidence for penecontemporaneous dolomitization in a supratidal environment, as well as post-depositional dolomitization by Mg-rich ground-water flushing. Various dolomite textures can be used to predict the environment of dolomitization. These textures are (1) replacement dolomitization of the total sediment so that original fabrics are preserved; (2) dolomitization by aggrading nemorphic processes; and (3) replacement dolomitization of fossils and pellets only. Other diagenetic processes which have affected the lithofacies include dissolution, recrystallization and inversion, and several phases of calcite cementation. The hydrologic regime and the original texture of the carbonate rock controlled the types of cement present. Scalenohedral crystals have been precipitated from marine waters along the test walls of internal chambers of fossils. Small, equant, blocky crystals have precipitated from meniscus fluid in the vadose zone of ground water as coatings along internal chamber walls of fossils and at the contacts between grains.

APPLICATIONS OF SURFACE RESISTIVITY METHODS,
Alberta Univ., Edmonton. Dept. of Geology.
F. W. Schwartz, and G. L. McClymont.
Ground Water, Vol. 15, No. 3, p 197-202, May-June 1977. 5 fig, 10 ref.

Descriptors: *Groundwater, *Surveys, *Resistivity, *Canada, Geology, Geophysics, Rock properties, Conductivity, Electrical resistance, Borehole geophysics, Sandstones, Glacial drift, Aquifers, Groundwater potential, Groundwater resources, Hydrogeology.
Identifiers: *Alberta(Canada).

Generally, the geology of the Breton area of Alberta consists of a 5- to 125-ft veneer of glacial till overlying sandstone and sandy shale units of the Paskapoo Formation. These sandstone units are locally important aquifers. Glacial drift in the Hastings Lake area varies in thickness from 100 to 200 ft and overlies the Horseshoe Canyon Formation, which consists of bentonitic shale, siltstone, and coal units with minor sandstone units. Groundwater yields from drift and bedrock in this area are generally less than 30 gpm (113.6 l/m). Resistivity sounding were completed at 68 and 65 stations in the Breton and Hastings Lake areas, respectively. Profile maps from the Breton area are characterized by broad areas with apparent resistivity values greater than 100 ohm-ft. Qualitative evaluation of the resistivity soundings and existing borehole data indicated that the high resistivity values resulted from a thick resistive sandstone aquifer less than 25 ft from ground surface. A reasonably well-defined resistivity pattern was evident on the profile maps of the Hastings Lake area, with the highest resistivity values coming from stations located in the hummocky moraine south of the lake. In addition to providing useful information on the geology of an area, surface resistivity methods provide a rapid and relatively inexpensive tool to aid in planning more detailed groundwater studies because of their ability to detect inhomogeneities in the subsurface environment. WATER-LEVEL DECLINE AND PUMPAGE IN DEEP WELLS IN THE CHICAGO REGION, 1971-1975,
Illinois State Water Survey, Urbana.
R. T. Sasman, C. R. Benson, J. S. Mende, N. F. Gangler, and V. M. Colvin.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-267 911, Price codes: A03 in paper copy, A01 in microfiche. Circular 125, 1977. 35 p, 8 fig , 4 tab, 12 ref, 1 append.

Descriptors: *On-site data collections, *Illinois, *Groundwater, *Water wells, *Deep wells, Water levels, Well data, Water sources, Groundwater mining, Water yield, Discharge(Water), Aquifers, Geology, Hydrology, Water supply, Potentiometric level.
Identifiers: Cook County(Ill), Du Page County(Ill), Kane County(Ill), Will County(Ill), McHenry County(Ill), Grundy County(Ill), *Chicago region(Ill).

Pumpage from deep wells in the Chicago region increased from 200,000 gallons per day (gpd) in 1864 to 150.7 million gallons per day (mgd) in 1971. As a result, artesian pressure in the Cambrian-ordovician aquifer in Chicago has declined more than 850 feet. Pumpage from deep wells in the Chicago region is concentrated in northwestern and western Cook County, eastern Du Page and eastern Kane Counties, and around Joliet in Will County. Heavy pumpage from deep wells outside the Chicago region occurs at Rockford, Belvidere, De Kalb-Sycamore, Rochelle, and Ottawa-Peru. From October 1971 through November 1975, pumpage from deep wells in the Chicago region increased to 165.7 mgd, an increase of 15.0 mgd or 10% more than the 1971 pumpage. For the Chicago region, average annual water-level declines during the 4-year period ranged from 6 feet in McHenry County to 16 feet in Grundy County and averaged about 12 feet. Water levels in 6 selected observation wells outside the Chicago region declined an average of 1.7 feet per year during the same period. Withdrawals since 1971 within the Chicago region exceeded the practical sustained yield of the Cambrian-Ordovician aquifer, as they have each year since 1958, with the result that groundwater users continue to mine water. By the end of 1975, more than half of the upper units of the aquifer already had been dewatered in many areas. If the distribution of pumpage remains the same and pumpage continues to increase as indicated by recent trends, the principal water-yeilding units of the aquifer will be partially dewatered in many areas much sooner than previously anticipated. Only a few pumping levels exceeded 1000 feet in 1971. In 1975, at least 17 municipal and industrial wells had pumps set at 1000 feet or deeper. Water levels for 664 wells were tabulated in an appendix. (See also W73-10993 and W75-04727) (Humphreys-ISWS)

AQUIFER MODELING HELPS FARMERS.
Water Research in Action, Vol. 1, No. 12, p 1-2, April, 1977.

Descriptors: *Mathematical models, *Computer models, *Aquifers, Planning, Irrigation water, Model studies.
Identifiers: *Snake River Plain Aquifer(Idaho).

A team of University of Idaho researchers and students are in the process of refining a computerized mathematical model of the Snake River Plain Aquifer, one of the most economically important water resources in Idaho. It is estimated that 4.5 million acre-feet of water flow through the 9,000 square mile aquifer each year. Among the values plugged into the model formulas are net amount of water applied by irrigation, the quantity of water used by vegetation, and precipitation/evaporation/snowmelt in the recharge areas. The net effect is a very usable predicting device that provides key information at selected points and indicates where more data needs to be collected. The model is now being used by Idaho Department of Water officials for water resource projections and planning studies. (Eberle-NWWA)

GROUND WATER RECHARGE IN EASTERN CONNECTICUT BASED ON SIMULATION MODELING,
Connecticut Univ., Storrs.
R. E. Cady.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-268 045, Price codes: A05 in paper copy, A01 in microfiche. Master of Science Thesis, 1975. 67 p, 9 tab, 19 fig, 2 append, 30 ref. OWRT A-052-CONN(10).

Descriptors: *Groundwater recharge, *Flow system, *Hydraulic models, *Hydraulic conductivity, *Hydraulic gradient, *Hydrogeology, Till, Glacial sediments, Streamflow, Permeability, *Connecticut, Bedrock, Simulation analysis.
Identifiers: *Fractured bedrock.

The flow system within fractured bedrock and till of Eastern Connecticut is approximated by a numerical simulation model of small ground water basins. Ground water recharge is calculated as that amount of water necessary to maintain the flow system since recharge is the only input to a natural undeveloped ground water basin. The model is based upon a steady-state solution to ground water flow equations for a series of representative cross sections through each basin. Hydraulic conductivities are adjusted to correlate the model with existing stream flow data. Resultant values for recharge and hydraulic conductivity are well within one order of magnitude of values determined through independent techniques (maximum discrepancy of 19 percent). Regional hydraulic gradient and localized flow systems exhibit a substantial contribution to control of amounts of ground water recharge beyond the limits imposed merely by glacially deposited overburden. Descriptors: *Model studies, *Drawdown, *Artesian aquifers, *Wisconsin, *Illinois, Digital computers, Computer programs, Aquifer characteristics, Sandstones, Analytical techniques, Projections, Withdrawal, Pumping, Water supply, Hydrogeology.
Identifiers: Southeastern Wisconsin, Northeastern Illinois.

The sandstone aquifer in southeastern Wisconsin and northeastern Illinois is modeled as being a confined aquifer underlain by an impermeable bed (Precambrian basement rock) and overlain by a leaky confining bed (Maquoketa Shale). The model is a digital-computer program that computes changes in head caused by pumping from the aquifer. The program solves finite-difference equations that approximate the partial-differential equation of two-dimensional, nonsteady groundwater flow. Basic input to the program consists of the hydrologic properties of the aquifer and pumpage from the aquifer. The model was calibrated by operating the program several times for the period 1880-1973, adjusting values of hydrologic properties until the computed drawdown approximated the known drawdown for that period. Using the calibrated model and estimated pumpage to 2000, drawdowns were predicted from 1974 through 1980, 1990, and 2000. Maximum drawdown is centered on New Berlin and is more than 300 feet from 1974 through 1990 and 450 feet from 1974 through 2000. (Woodard-USGS)

Inland wetlands in Connecticut, presently defined by soil type, are delineated according to the National Cooperative Soils Survey of the U.S.D.A. Soil Conservation Service, a method which can produce many discrepancies in the location of inland wetland boundaries. This study examining alternate delineation methods, was designed to (1) investigate vegetation distribution and selected physical and chemical properties of wetland soils and bordering uplands and the interface between the two, and (2) provide the ground truth necessary for the identification and delineation of deciduous wetland forests using false color infrared (FCIR) imagery. In study sites located within the Town of Mansfield, Connecticut, line transects were laid out across wetland to upland transition zones, with plant species and layers identified, their positions recorded, and crown cover determined. Discriminant analysis applied to abundance data showed which members of plant species best separate wetlands from uplands and which were representative of natural plant associations. Results from the soil studies reveal that the wetland soil to upland soil gradient changes significantly in soil pH and in soil water content. Soil water and topographic position govern plant distribution along these gradients, accounting for the distinct separation of wetland and upland plant associations. Of the criteria studied, vegetation distribution and crown cover, soil water content, and relief are the most useful for delineating deciduous wetland forests and are valuable in using remote sensing imagery. Identifiers: Watershed soils, *Rainfall infiltration, Semi-arid soils.

Rainfall infiltration characteristics for a semi-arid watershed soil were studied. The soil examined was obtained from Page Ranch, 25 miles north of Tucson, AZ. Laboratory infiltration tests were conducted on reconstructed soil profiles similar to those on the watershed. A mathematical model of infiltration, developed by Dr. Roger Smith, was used to simulate the infiltration process. Results from infiltration tests conducted on site at the watershed during a previous research study were also simulated using the infiltration model. Laboratory and field infiltration tests were conducted using a realistic rotating disk rainfall simulator. Single- and dual-source gamma ray attenuation techniques were used to obtain soil moisture measurements within the laboratory soil profiles. Direct measurement of surface crusting effects in the laboratory using the dual-source technique was attempted but was determined to be unworkable due to resolution and boundary effect problems. Using the measured saturated hydraulic conductivity values of the laboratory and field soils, and the unsaturated soil properties as measured for the field soil, the mathematical model of infiltration as developed by Roger Smith simulated the infiltration rates of bare test plots. By changing the saturated conductivity of the upper soil layer, it was also possible to simulate the infiltration process on a grass-covered field plot.

ROOT GROWTH, STRENGTH, AND CHEMICAL PROPERTIES OF A HOBSON FRAGIPAN,
Missouri Univ., Columbia. Dept. of Agronomy.
C. R. Edmonds.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-267 908, Price codes: A07 in paper copy, A01 in microfiche. M.S. Thesis, May 1976. 132 p, 23 fig, 16 tab, 86 ref, append. OWRT A-087-MO(2), 14-34-0001-6026.

Descriptors: Effluents, *Hydraulic conductivity, *Root growth, Soil strength, *Soil water movement, Waste water disposal, *Soil profiles, Soil properties, *Acidity, Acidic soils, *Missouri, *Soil horizons, *Soil chemical properties, Ion exchange, Soil-water-plant relationships.
Identifiers: *Fragipan horizon(Soils).

A large percentage of Ozark soils in Missouri possess a fragipan horizon. The fragipan restricts water movement and root growth in the profile. This study was conducted to evaluate the effect of changes in acidity and bulk density on the Hobson fragipan with respect to root growth and hydraulic conductivity. Chemical and physical tests associated with basic soil properties were determined. Ion exchange relationships of six ion pairs, along with ion products of Fe, Al, and Mn hydroxides were examined. Hydraulic conductivity, probe penetration, and root growth experiments were conducted on reformed and natural samples of B2 and fragipan horizons. The rate of probe penetration had no effect on point resistance in reformed cores. Both acidity and high bulk density restrict root growth in the Hobson B2 and fragipan horizons. Data suggest low pH could induce Al toxicity in unlimed samples of both the B2 and fragipan soil. In reformed cores root growth was restricted at strengths between 10 and 20 bars, and greater strengths effectively stopped root growth. Strength of undisturbed B2 and fraigpan cores was 20 to 25 bars and greater than 100 bars, respectively, at 0.33 bar moisture tension. No roots penetrated either core. The hydraulic conductivity of reformed cores was only slightly increased due to calcium oxide addition. Indications are the fragipan would remain stable with respect to roots and water movement unless it was physically modified. Profile modification would need to be suplemented with lime to effectively increase root distribution in the Hobson profile. (Blanchar-Missouri)

LANDSAT-1 DATA, ITS USE IN A SOIL SURVEY PROGRAM,
South Dakota State Univ., Brookings. Dept. of Plant Science; and South Dakota State Univ., Brookings. Remote Sensing Inst.
F. C. Westin, and C. J. Frazee.
In: Proceedings of the NASA Earth Resources Survey Symposium, June 1975, Technical Session Presentations, Agriculture-Environment, Volume I-A. Report No. NASA TM X-58168. Symposium held June 9-12, 1975, Houston, Texas, p 67-95, September 1975. 16 fig, 2 tab, 6 ref. NASA 5-21774, NASA 42-003-007.

Descriptors: *Soil surveys, *South Dakota, *Mapping, *Remote sensing, Soils, Maps, Surveys, Soil relief, Soil texture, Land use, Data processing, Satellites(Artificial), Analysis, Analytical techniques, Synoptic analysis, Distribution patterns, Soil types.
Identifiers: LANDSAT, Thematic soil maps.

The three objectives for this study were: (1) to investigate the unique characteristics of LANDSAT imagery as they aid in recognizing soil survey boundaries; (2) to explore the use of LANDSAT imagery for low intensity soil surveys; and (3) to investigate LANDSAT imagery as a base map for publishing thematic soil maps. Using many of the characteristics of LANDSAT imagery, a low intensity soil survey of Pennington County, South Dakota, was completed in 1974. LANDSAT-1 color composite transparencies, single band transparencies, and enlargement prints were interpreted to produce a soilscape map for 400,000 hectares. Areas of similar photographic characteristics were delineated on mylar over a color composite using a light table and a three-power magnifying glass. The field checking was done by a resource team of soil, geology, and range science specialists. The color composite transparency was adequate for locating most of the boundaries between soilscape areas. The soilscape map was interpreted to give general guidelines for land evaluation. It was concluded that a LANDSAT photographic background for soil-related information greatly enhances its use since much can be deduced about hydrology and land use. Descriptors: *Soil surveys, *Indiana, *Remote sensing, *Glaciation, Pleistocene epoch, Soil classification, Land use, Soil types, Prairie soils, Glacial drift, Aquifers, Geomorphology, Satellites(Artificial).
Identifiers: LANDSAT, Udoll soils, Udalfs, Timber soils.

The continuity of a narrow meandering strip of Udoll (prairie) soils running east and west for approximately 40 miles across north central Indiana in an area predominantly of Udalfs (timber soils) was apparent in LANDSAT-1 (ERTS-1) data. The dark Udoll soils ocur in predominantly flat topography, contrasting sharply in satellite imagery from surrounding light colored Udalf soils in the characteristically rolling, undeveloped landscape of the late Wisconsin till plains. This dark stretch of prairie soil is believed to have formed in the heavy textured, poorly drained glacial debris which filled a major pre-glacial tributary of the Teays River system. This valley was apparently re-occupied and partly re-excavated by surface drainage during interglalcial times, following retreat of the Kansan and Illinoisan age ice invasions. Final filling of the valley occurred during retreat of the East White sublobe of the Wisconsin stage ice. The origin and the continuity of this meandering stretch of prairie was not recognized by soil scientists who, over a 60 year period, mapped the three counties which encompass it. Furthermore, geologists who had been searching for the exact location of this buried valley had been unsuccessful until the LANDSAT data provided an adequate synoptic view. Ready identification and location of the valley has significance to soil survey and land classifiction people as a guide to soil classification and land use and to geologists as a guide to location of a potentially economically significant aquifer. Descriptors: *Water circulation, *Lakes, *Model studies, *Numerical analysis, Analytical techniques, Finite element analysis, Mathematical models, Reservoirs, Turbulent flow, Gravity waves, Mixing.

A mixed analytical and numerical model to study the wind-driven, transient, three-dimensional circulation in lakes is presented. Emphasis is placed on the formulation and development of the model, which consists of a formal analytical solution together with a system of depth-averaged conservation equations. After solving the depth-averaged system numerically by the finite element technique, the three-dimensional velocity profiles are calculted from the formal solution. Simulation of an idealized lake shows good agreement on the general circulation pattern and wave characteristics with the work of others. The limitation of this model is examined, and a solution is proposed to accommodate it. (Woodard-USGS)

Descriptors: Rain, *Lake shores, *Paleohydrology, Paleoclimatology, Lake morphology, Lake beds, *Climates, *Nevada, Great Basin, Lakes, Evaporation, Lake basins.
Identifiers: *Lake Lahontan(Nev), *Pluvial climates, *Pluvial lakes, Lake evaporation.

Study for shoreline evidence in more than 81 basins of Nevada has yielded recognition of 53 pluvial lakes of Lahontan (Wisconsinan) age, probable shoreline evidence of three pre-Lahontan Lakes in three basins, and absence of shoreline features in many basins previously thought to have contained pluvial lakes. Basin areas, basin floor altitudes, lake areas, lake altitudes, over-flow relations and other data have been developed to aid in quantitative analysis of full pluvial climates of Lahontan age in Nevada. Using modern aspects of Great Basin climates and associates hydrology, the observed pluvial lake paleohydrology could have been maintained by mean annual temperatures approximately 5 deg F lower than modern mean annual temperatures, corresponding pluvial mean annual precipitation averaging 68 percent over modern precipitation, and mean annual pluvial lake evaporation averaging 10 percent less than mean annual modern lake evaporation. The analyses indicate modern climates of the coolest and moistest parts of Nevada (extreme northwest Nevada and some parts of northeastern Nevada) were likely similar to the full pluvial climates in parts of southcentral Nevada and northwestern Nevada. PUMPED-STORAGE IN THE PACIFIC NORTHWEST, AN INVENTORY.
Corps of Engineers, Portland, Oreg. North Pacific Div.
Report 26, January 1976. 151 p, 30 fig, 8 tab, 1 append.

Descriptors: *Pumped storage, *Pacific Northwest US, *Hydroelectric power, Powerplants, Lakes, Reservoirs, Peak power, Electric power production, Underground powerplants, Economics, Reservoir operation, Reservoir sites, Electric power demand.
Identifiers: *Pumped storage inventories, Weekly cycle pumped storage sites.

This report was prepared in response to a 1975 Congressional request that the Corps of Engineers compile an inventory of the potential pumped-storage projects in the Pacific Northwest and to identify those sites which have the most potential for inclusion in the basin development plan. The inventory covered the entire States of Oregon, Washington, and Idaho, and those portions of western Montana, Wyoming, Utah, and Nevada falling within the Columbia River Basin. The report consisted of a discussion of criteria used in selecting and evaluating sites, a listing of potential sites, together with preliminary estimates of plant size, reservoir characteristics, annual costs, and an evaluation of some of the more promising sites. Both daily/weekly and seasonal pumped-storage sites were included in the inventory. (Sims-ISWS)

BENTHIC MICROBIAL COMMUNITY RESPIRATION OF A SOFT-WATER LAKE,
Connecticut Univ., Storrs. Inst. of Water Resources.
S. G. Hornor.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-267 917, Price codes: A05 in paper copy, A01 in microfiche. Ph.D. Dissertation, 1977. 90 p, 19 fig, 4 tab, 73 ref. OWRT A-054-CONN(3), 14-31-0001-4007.

Descriptors: *Lake sediments, *Sediment-water interfaces, *Microbial degradation, *Chemical oxygen demand, *Oxygen, *Productivity, *Water analysis, *Aerobic bacteria, *Anaerobic bacteria, Temperature, Light intensity, Connecticut.
Identifiers: *Benthic microbial community respiration, *Soft-water bog lake, *Gas exchange, *Dissolved organic carbon, *Alternate terminal electron acceptors, *Dehydrogenase activity, Optical density, Dunham Pond(Conn).

Over a three year period, microbial community respiration of the sediment-water interface and the upper 9 cm of the surface sediments of Dunham Pond, a small (4.7 ha surface area), shallow (maximum depth 4.5 m), stratifying, soft-water bog lake in eastern Connecticut, was estimated. Relative rates of gas exchange were estimated and seasonal changes in dissolved organic carbon and optical density were analyzed for the overlying water, while light intensity and temperature were measured at the sediment surface. These variables indicate that the concentration of oxygen in the overlying water is the single most important factor influencing rates of gas exchange at the sediment-water interface. Community respiration of the surface sediments was estimated by two independent means: The accumulation of chemical oxygen demand and the relative rates of electron transport as measured by dehydrogenase activity. Respiration was found to decrease with increasing sediment depth. Colony forming units of aerobic and anaerobic bacteria in the sediment horizons were estimated over several annual cycles. Sediments data indicate that respiration within the sediment column is limited by the availability of alternate terminal electron acceptors. The results of experiments with intact cores and sediment horizons indicate that Dunham Pond is a relatively productive lake, with the majority of productivity based on the benthic microbial community.

LAKE NAIVASHA AND LAKE NAKURU: AN ECOLOGICAL COMPARISON BETWEEN TWO BIRD LAKES IN EAST AFRICA, (IN SWEDISH),
Uppsala Univ. (Sweden). Inst. of Zoology.
A. Lundberg, and B. Tallmark.
Fauna Flora (Stockh). 68(1), p 1-15, 1973.

Descriptors: *Africa, *Lakes, *Ecology, Vegetation, *Aquatic algae, Invertebrates, *Birds, Water pollution, *Aquatic plants.
Identifiers: *Lake Naivasha(East Africa), *Lake Nakuru(East Africa), Alkaline lakes.

The Rift Valley lakes are of great biological interest because of their extremely rich bird fauna. Lake Naivasha is a fresh-water lake; Lake Nakuru is alkaline. Due to this, there is a great difference of vegetation. The water vegetation of Lake Naivasha is highly developed, e.g., sedge, papyrus, water-lilies and submersed species, while plankton is of less importance. The algae of Lake Nakuru form almost the whole vegetation. The number of invertebrate species is also much greater in Lake Naivasha than in Lake Nakuru. The bird fauna is more differentiated in the fresh-water lake, but because of the enormous supply of food avaiable for primary consumers of birds, the number of the latter is greater in the alkaline lake. Due to the position of the lakes in a relatively densely populated district and the lack of outfall of Lake Nakuru, the risk of pollution is great. Investigations have indicated very low toxic proportions in animals. The rapid increase of (human) population in Africa may quickly change the situation for the worse.--Copyright 1975, Biological Abstracts, Inc.

FOX CHAIN OF LAKES INVESTIGATION AND WATER QUALITY MANAGEMENT PLAN,
Illinois State Water Survey, Urbana.
V. Kothandaraman, R. L. Evans, N. G. Stall, and D. L. Gross.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-268 125, Price codes: A10 in paper copy, A01 in microfiche. Cooperative Resources Report 5, Illinois State Water Survey, Illinois State Geological Survey, 1977. 200 p, 106 fig, 59 tab, 126 ref.

Descriptors: *Lakes, *Water quality, *On-site investigations, *On-site data collections, *Illinois, *Data collections, *Hydrologic data, Hydrologic aspects, Hydraulics, Water levels, Water temperature, Limnology, Sediments, Trace elements, Water balance, Water circulation, Nutrients, Eutrophication, Biological properties, Chemical properties, Physical properties, Water pollution sources, Algae, Benthos, Glacial soils, Geology.
Identifiers: *Fox Chain of Lakes(Ill).

The results of an extensive technical program conducted jointly by the Illinois State Water Survey and the Geological Survey on the Fox Chain of Lakes were presented. This effort was directed toward ascertaining the causes of lake eutrophication and the means by which the causes may be halted, reversed, or at least minimized. Geographic, geologic, hydrological, physical, chemical, and biological characteristics of the lakes were employed in identifying the causes of eutrophic conditions of the lakes. The trophic condition of the lakes was discusses as related to their limnological characteristics and nutrient budget. The nutrients responsible for the accelerated aging of the lakes were identified, and the sources of the nutrients and proportional contribution of each source were assessed. Only about 27% of the lakes drainage area as measured at Jognburg lie within Illinois. The Chain's water surface area is approximately 6850 acres, and the lakes have a mean depth of about 5.7 feet at the normal pool elevation 736.5 feet above msl. Artificial destratification and the chemical controls proposed are designed to offer some immediate relief from the consequences of eutrophication. The ultimate success in reversing the eutrophic trends in the Fox Chain of Lakes will depend on the drastic reduction of the nutrient loading to the lake system both from without and within the lake area. Identifiers: *Osmotic potential.

Comparisons were made between cultivated safflower varieties (Carthmus tinctorius L.) and six wild ecotypes (C. oxyacantha Bieb.) for their tolerance to simulated drought conditions. Experiments were made to compare different osmotic substances and the relative tolerance of wild ecotypes and cultivated varieties of safflower. These experiments may be valuable in finding the strain most resistant to drought. Plant characteristics of the wild strains were noted and soil samples from their collection sites were analyzed for the electrical conductivity of the saturated extract. Polyethylene glycol, mannitol, and sodium chloride were used as osmotic substrates. The influences of treatments were studied on seed germination, shoot length, and fresh and dry weight of shoots and roots of seedlings. The results are presented. Increased osmotic potentials progressively delayed and reduced seed germination, shoot length and fresh and dry weights of seedlings. Shoots were, however, more adversely affected than roots. Wild ecotypes were apparently more sensitive to high osmotic potentials than the cultivated varieties. (Jamail-Arizona).

Identifiers: *Berkshire Hills(Mass), *Laminated sediments, Sediment sampling techniques.

Laminated sediments are common in the profundal sediments of the deeper holomictic lakes in the Berkshire Hills of Massachusetts. The laminae are best developed in lakes subject to prolonged seasonal hypolimnetic anoxia and in one lake are limited to water depths in which seasonal anoxia occurs. Samples were taken from the deepest area of all lakes using Ekman dredges, dried, sliced into vertical sections, scraped or cleaned, oven-dried and then examined for sediment laminae. Descriptors: *Beach erosion, *Shores, *Lake Michigan, *Great Lakes, Surveys, Measurement, Lakes, Water levels, Coasts, Beaches, Erosion, Sedimentation, Sediments, Geomorphology.
Identifiers: *Bluff erosion, *Beach profiles.

This field study of beach changes on the eastern shore of Lake Michigan concerned the movement of the bluff or the edge of the terrace marking the landward boundary of the beach. Data collected every 4 weeks from August 1970 to August 1972 indicated recession or no change at each of 17 profile sites on a 250-mile segment of the east coast of Lake Michigan. During this period, lake levels were rising from a mean of 578.9 ft above mean water level (MWL) in 1970 to 579.7 ft MWL in 1972. The maximum bluff erosion at any one site between monthly surveys was 20 ft at profile 4 in June 1972. Variables affecting the rate of movement of the bluff include lake level, composition of the bluff or terrace, orientation and straightness of shoreline, wave climate, manmade structures, and possibly longshore bars. There was a lack of correlation between bluff erosion at nearby stations, but each site varied seasonally, with maximum erosion occurring in late fall when storm occurrence is also high. Shore ice protected the beaches in winter; erosion resumed in spring at a reduced level. Beach width from the base of the bluff to the water level at the time of the survey also varied seasonally, with beaches narrow in early summer when lake level is at a maximum and wider in late fall when lake level is at a lower level. The study beaches were mostly well-sorted sand (mean grain size between 0.330 to 0.189 mm or 1.60 and 2.40 phi units), with some gravel and heavy mineral concentrations.(Sims - ISWS)

K. M. Cunningham, M. C. Goldberg, and E. R. Weiner.
Analytical Chemistry, Vol 49, No 1, p 70-75, January 1977. 3 fig, 2 tab, 23 ref.

Descriptors: *Water analysis, *Chemical analysis, *Spectroscopy, *Dissolved solids, Analytical techniques, Solutes, Ions, Remote sensing.
Identifiers: *Laser raman spectrometry.

The influence of experimental parameters on detection sensitivity was determined for lasar Raman analysis of dissolved solutes in water. Individual solutions of nitrate, sulfate, carbonate, bicarbonate, monohydrogen phosphate, dihydrogen phosphate, acetate ion, and acetic acid were measured. An equation is derived which expresses the signal-to-noise ratio in terms of solute concentration, measurement time, spectral silt width, laser power fluctuations, and solvent background intensity. Laser beam intensity fluctuations at the sample and solvent background intensity are the most important limiting factors. (Woodard-USGS)

R. J. Clarkson, Jr.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-268 245, Price codes: A04 in paper copy, A01 in microfiche. Master of Science Thesis, December 11, 1974, 46 p, 17 fig, 23 ref. OWRT A-035-ALA(6).

Descriptors: Fungi, Metabolism, *Fluorescence, *Analytical techniques, *Spectroscopy, Chemical analysis, Pollutant identification, Molecular structure, Luminescence, Instrumentation.
Identifiers: Spectroanalytical parameters, *Fungal metabolites, *Oosporein, *Desmethoxyviridiol, *Phosphorescence, Spectral anomalies.

The spectroanalytical parameters of oosporein were investigated, and the fluorescence spectra were reported, a possible explanation of anomalies which occurred in the course of the research, is discussed. Molecular weight studies were carried out on oosporein in an effort to explain the spectral anomalies either in terms of decomposition of oosporein or in terms of dimerization. Also, some related research in terms of EPR data and visible spectra was performed. The spectroanalytical parameters of desmethoxyviridiol were investigated, and U.V., flurorescence, and Phosphorescence spectra were reported, as well as extinction coefficients and fluorescence and phosphorescence lifetimes. Some discussion was presented in terms of irregularities in the Beer's plot as well as in the dilution-fluorescence intensity plot, and a possible explanation was offered. Quenching experiments were performed in order to ascertain whether the low-temperature luminescence of desmethoxyviridiol was due to phosphorescence or delayed fluorescence.

METHODOLOGY FOR APPLYING THE FINITE ELEMENT METHOD TO PARTIALLY STRATIFIED ESTUARIES,
Clemson Univ., S.C. Dept. of Civil Engineering.
J. E. McCoy, and B. L. Edge.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-267 719, Price codes: A04 in paper copy, A01 in microfiche. Clemson University Water Resources Research Institute, Report No. 66, January, 1977. 45 p, 3 fig, 27 ref, 3 append. S-052-SC.

Descriptors: *Estuaries, *Mathematical models, *Stratification, Hydrodynamics, *Finite element analysis, Model studies, Equations, Methodology, *Stratified flow, Numerical analysis.
Identifiers: Galerkin method.

A two-dimensional model which predicts constituent transport in stratified estuarine flow systems would enable planners and engineers to determine consequences of proposed modifications to stratified bodies of water. This study attempts to ascertain whether the finite element method can be formulated for a stratified system and then determines a nonlinear numerical analysis based on the finite element approach for an estuarine system. A finite element model of two-dimensional constituent transport is developed and applied to stratified flow systems. The results indicate that the finite element method can be successfully developed to model stratified flow systems. The finite element method is applied to the equations of motion, continuity, constituent transport, and density variation with salinity. Assumptions consistent with application to estuarine systems are defined. The parameters are approximated by a polynomial variation over each element in the system representation. The Galerkin method is used to determine the values of the parameters at element nodes, by solution of a system of simultaneous equations. With the nodal values of the parameters obtainable, a finite difference technique is used to extend the calculations through time. In addition to showing the applicability ot the finite element method to stratified flow systems, a formulation of the governing equations of estuarine flow is presented in algorithmic form according to the finite element solution technique. This formulation is a prerequisite to the construction of a computer algorithm to execute the numerous repetitive calculations and to subsequently model estuarine stratified flow successfully.

Descriptors: *Saline water, *Reflectance, *Refractivity, *Infrared radiation, *Great Salt Lake, *Pacific Ocean, *Atlantic Ocean, Optical properties, Sea water, Aqueous solutions, Laboratory tests, Salinity, Salts, Lakes, Oceans, Phosphates, Mine water, Effluents, Remote sensing, Chemical analysis, Data processing, Analytical techniques.
Identifiers: *Dead Sea(Israel), *San Francisco Bay(Calif).

By using distilled water as the standard reflector, relative specular reflectance spectra in the 2- to 20-

micrometer wavelength region of the infrared were measured for surface water samples collected from the San Francisco Bay, the Pacific Ocean, the Atlantic Ocean, the Great Salt Lake (Utah), the Dead Sea (Israel), and an effluent pit of a phosphate mine in central Florida. Phase difference spectra and spectral values of the complex refractive index were computed for each water sample by applying a Kramers-Kronig analysis to the relative reflectance spectra. Spectral values for the complex refractive index suitable for Mie scattering calculations were tabulated for each water sample. The reflectance spectra of the natural saline waters bore great similarity to spectra for individual aqueous solutions containing NACl, K2S04, NH4H2P04, NaNo3, and NaHC03. Chemical analyses of the water samples also were presented in tabular form. (Sims-ISWS)

EFFECTS OF 40-FOOT CHARLESTON HARBOR PROJECT ON TIDES, CURRENTS, AND SALINITIES; HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss. Hydraulics Lab.
H. A. Benson.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A024 524, Price codes: A09 in paper copy, A01 in microfiche. Miscellaneous Paper H-76-9, May 1976. 188 p, 92 fig, 70 tab.

Descriptors: *Model studies, *Harbors, *Estuaries, *South Carolina, *Hydraulic models, Rivers, Tides, Currents(Water), *Salinity, Channels, Navigation, Flow, Saline water intrusion, Channel improvement, Shoals, Coastal engineering.
Identifiers: *Charleston Harbor(SC).

The Charleston Harbor Model reproduced the Ashley, Cooper, and Wando Rivers and a portion of the Atlantic Ocean. The model was of fixed-bed construction and was equipped with all the necessary appurtenances for accurate reproduction and measurement of tides, tidal cuurrents, salinity intrusion, and other significant phenomena of the prototype. The plan tested consisted of deepening the existing 35-ft-deep Cooper River navigation channel to 40 ft from the ocean to approximately river mile 20.6 and Shipyard Creek to 38 ft. In addition, the proposed Wando River Terminal channel was installed in the model at a depth of 35 ft. Hydraulic and salinity tests were made with the deepened project for two Pinopolis release conditions. The first condition involved the existing weekly average freshwater discharge at the Pinopolis power generating station of 15,600 cfs. The second flow condition reproduced a weekly average flow at Pinopolis of 3500 cfs. The results of these tests were reported. (Sims-ISWS)

THERMAL SENSOR FOR MEASUREMENT OF OCEAN CURRENT DIRECTION,
Office of the Secretary (Navy), Washington, D.C.
G. A. Edgerton.
U.S. Patent No. 3,995,480, 4 p, 4 fig, 9 ref; Official Gazette of the United States Patent Office, Vol 953, no 1, p 66, December 7, 1976.

Descriptors: *Patents, *Currents(Water), *Ocean currents, Instrumentation, Measurement, Flow measurement, Water circulation, Turbulence, Velocity.
Identifiers: Current direction, Sensors, Thermal sensors.

The measurement of direction of ocean current using a thermal sensor can be accomplished by using simple convective heat transfer theory. If a body (cylinder or sphere) is immersed in a moving fluid a boundary layer develops from the leading edge, or rather the stagnation point. In this boundary layer, the fluid velocity increases from zero at the surface of the body to the value of the velocity of the inviscid flow around the body. The flow in the boundary layer in the vicinity of the stagnation point is always laminar, but transition to turbulent flow may occur at some point downstream of the stagnation point. The changes in both the laminar to turbulent flow and the velocity gradient around the body cause a temperature gradient around the body. This invention uses a sensor having a spherical configuration for the measurement of ocean currents. A hollow spherical housing made from material that has good heat transfer characteristics has its inside lined with a multitude of temperature sensing elements which are used to determine the two stagnation points on the sphere when immersed in a moving fluid. The stagnation points always align themselves with the direction of fluid flow. (Sinha-OEIS)

SUSPENDED-PARTICLE TRANSPORT AND CIRCULATION IN SAN FRANCISCO BAY: AN OVERVIEW,
Geological Survey, Menlo Park, Calif. Water Resources Div.
T. J. Conomos, and D. H. Peterson.
In: Estuarine Processes, Vol II; Circulation, Sediments, and Transfer of Material in the Estuary, 1977: Academic Press, Inc., New York, p 82-97, 1977. 6 fig, 1 tab, 41 ref.

Descriptors: *Sediment transport, *Particle size, *Water circulation, *Bays, *California, Sediment distribution, Suspension, Deposition(Sediments), Estuaries, Sediment load.
Identifiers: *San Francisco Bay, Sediment resuspension.

Differences in the relative magnitude and timing of wind stress and river inflow in the northern and southern reaches of San Francisco Bay create different sedimentary conditions. The northern reach is a partially to well mixed estuary receiving most of the total annual fresh-water input (840 cubic meter/sec) and suspended sediment input (4 million metric tons) into the bay; more than 80% of the sediment is received during winter. Density-driven nontidal estuarine circulation (about 5 cm/sec) maintains a turbidity maximum which changes seasonally in particle concentration (40 to 80 mg/liter). Strong tidal currents (< or = 225 cm/sec) and wind-generated waves resuspend sediment from the shallow bay floor: some of the riverborne sediment deposited during winter is resuspended during summer and transported landward to the turbidity maximum. Long-term sediment data (extrapolated from bathymetric charts) indicate that the northern reach is an effective sediment trap. In contrast, long-term sediment data suggest that the southern reach is experiencing net erosion. The southern reach receives little river inflow or riverborne suspended sediment, and the average nontidal circulation is weak (< or = 2 cm/sec). The principal source of suspended sediment (25 mg/liter) in the southern reach is the shallow bay floor (average depth 6 m). (Woodard-USGS)

STATUS OF REVERSE OSMOSIS DESALINATION TECHNOLOGY,
Office of Water Research and Technology, Washington, D.C. Membrane Processes Div.
K. C. Channabasappa.
Desalination, Vol 17, p 31-67, 1975. 31 fig, 12 tab, 14 ref.

Descriptors: *Reverse osmosis, *Desalination apparatus, *Costs, *Reviews, Water treatment, Brackish water, Saline water, Sea water, Desalination, Membrane processes, Technology, Unit costs, Operating costs, Methodology, Thin films.
Identifiers: Plugging index.

Reverse osmosis (RO), a relatively new technology, gradually is becoming as established and economical method for demineralization of saline waters. Over 50 commercial plants ranging in size from 50,000 gpd to 2 million gpd (2 mgd) are producing fresh quality water for municipal and industrial uses from brackish water sources. Congress has authorized construction of a 100 mgd plant in Yuma, Arizona, to demineralize otherwise unusable high salinity irrigation return flows as part of the Colorado River Salinity Control. Engineering design and operation details, plant, were presented. A review of the plant operation data indicate that it is imperative for the plant owners and equipment suppliers to place due emphasis on providing adequate feed water pretreatment facilities and trained plant operation personnel to ensure trouble-free operation and to achieve further economy in desalting costs. Significant advances have been made in the development of RO process for seawater desalination. Soaring energy costs are providing incentive for plant owners to prefer RO plants (up to 100,000 gpd) over vapor compression distillation hardware. Results of the Federal Government Desalting R and D Programs clearly indicate that RO desalting costs will be at least 20-30% lower than distillation. (Humphreys-ISWS)

TRANSFERENCE: A COMPREHENSIVE PARAMETER GOVERNING PERMEATION OF SOLUTES THROUGH MEMBRANES,
Alza Corp., Palo Alto, Calif.
F. Theeuwes, R. M. Gale, and R. W. Baker.
Journal of Membrane Science, Vol. 1, No. 1, p 3-16, March 1976. 9 fig, 10 ref.

Descriptors: *Membrane processes, *Permeability, *Laboratory tests, *Mathematical models, Diffusion, Membranes, Transfer, Analysis, Analytical techniques, Testing procedures, Sorption, Solutes, Measurement, Saturation.
Identifiers: Ficks law, *Transference(Membrane processes).

Experimental studies of the diffusion of moderate molecular weight drugs through synethetic polymeric membranes has led to the definition of a new parameter to characterize solute permeation. The accepted parameter which describes transmembrane flux is permeability, P, defined as the product of the flux times the membrane thickness divided by the concentration difference across the membrane in the external solution. The new parameter described is called transference, T, and is defined as the mass of solute transferred from a saturated solution, under perfect sink conditions, across the membrane per unit time and area, multiplied by the thickness of the membrane. Regardless of whether there is solvent-membrane interaction or not, the permeability coefficient, P, for given solute and membrane differs from one solvent to another. In contrast, transference is independent of solvent, unless there is solvent-membrane interaction, in which case the inconsistency of transference for a particular solvent signifies that the membrane is modified by the presence of that solvent or solvent-solute combination. Therefore, transference is a more comprehensive parameter than permeability and is basic at the same time to solute-membrane permeation. When transference is introduced into Fick's law, it is obvious immediately that the flux of solute through the membrane, at equal fraction of saturation in any donor solvent, is equal and independent of the donor solvent in the absence of solvent-membrane interaction, when the solute has a constant solvent-membrane partition coefficient. Two examples of the use of the transference parameter were provided. (Humphreys-ISWS)
W77-08231

PRODUCTION OF ENERGY FROM CONCENTRATED BRINES BY PRESSURE-RETARDED OSMOSIS, 1. PRELIMINARY TECHNICAL AND ECONOMIC CORRELATIONS,
Ben Gurion Univ. of the Negev, Beersheba (Israel). Research and Development Authority.
S. Loeb.
Journal of Membrane Science, Vol. 1, No. 1, p 49-63, March 1976. 5 fig.

Descriptors: *Osmosis, *Electric power production, *Economics, *Membrane processes, Theoretical analysis, Foreign research, Brines, Saline water, Energy, Unit costs, Membranes, Electric power, Power plants.
Identifiers: *Israel, Pressure retarded osmosis.

Preliminary technical and economic correlations were made on the production of energy from concentrated brines by Pressure-Retarded Osmosis (PRO). In PRO, the hydraulic pressure is less than the osmotic pressure, so that water flux is against the hydraulic pressure gradient, this fact being the basis for energy production. It is visualized that a PRO power plant, operating continuously, would pump a concentrated brine such as Dead Sea brine on the outside of the fibers in hollow fiber modules at a high hydraulic pressure. Simultaneously, Jordan River water or brackish springs would be pumped through the inside of the fibers and would permeate through the fiber wall into the pressurized brine. The permeate-enhanced brine would be depressurized through a hydroturbine, delivering net power equal to the high hydraulic pressure x the permeate rate, in the idealized case. A transport analysis indicated that an asymmetric membrane, with the brine on the skin side, is as desirable in PRO as it is in reverse osmosis from the standpoint of high water permeation flux. The mechanical efficiency of a PRO power was examined. The efficiency is very sensitive to the ratio of concentration brine rate to permeate rate, a low value of this ratio (Less than 2) being desirable. A preliminary analysis was made of the unit cost of energy production from a PRO plant. The results were expressed as a function of the ratio of concentrated brine to permeate rate, the water flux, and the hydraulic pressure used. The analysis indicated the desired course of experimentation to obtain data for calculation of the minimum unit energy costs. (Humphreys-ISWS)

COMPUTER PREDICTION OF STATIONARY STATES OF MEMBRANES FROM DIFFERENTIAL PERMEABILITIES,
Aberdeen Univ. (Scotland). Dept. of Chemistry.
C. McCallum, and P. Meares.
Journal of Membrane Science, Vol. 1, No. 1, p 65-98, March 1976. 19 fig, 4 tab, 27 ref.

Descriptors: *Membranes, *Mathematical models, *Membrane processes, *Theoretical analysis, Zeta potential, Permeability, Computer models, Ion exchange, Cation exchange, Electrodialysis, Osmosis, Computer programs, Foreign research, Diffusion, Evaluation.
Identifiers: Computer flow diagrams.

It is desirable to be able to predict from data on the concentration-dependent permeabilities how a macroscopic membrane of known dimensions would perform under a given set of external constraints, e.g., when a predetermined current is passed through the membrane placed between particular external solutions as in electrodialysis. A computational procedure was developed which enables the final steady-state under given constraints to be evaluated by an iterative procedure. The membrane is regarded as a hypothetical series array of slices of equal thickness. The number of slices has to be chosen sufficiently large that the difference in composition across any single slice is small enough for its behaviour to be described by the local coefficients appropriate to the mean composition of the slice. The computation then adjusts the profiles across the whole membrane until each slice is in interfacial equilibrium with its neighbours and the imposed constraints are satisfied. The required fluxes and forces are then evaluated without difficulty. Useful and informative by-products from the computations are the steady profiles of the intensive variables in the membrane. The profiles are not accessible to direct measurement. The procedure was tested by calculating the osmotic and salt diffusion fluxes and the membrane potentials when the membrane separates different solutions at zero current and pressure difference. Although the computation requires the inversion of a 60 x 60 square matrix in most cases, the results were found to agree satisfactorily with those obtained experimentally. The procedure has been used to generate fluxes when an electric current is passed between different solutions as in electrodialysis. The data show how the membrane properties in electrodialysis depend on the current density, external concentrations and membrane thickness in a more precise way than has been available hitherto. The membrane profiles were found to exhibit a very pronounced dependence on the current density. (Humphreys-ISWS)

THERMOCOMPRESSION-TYPE APPARATUS FOR DESALTING SALINE WATER,
Societa Italiana Resine S.p.A., Milan (Italy).
D. Barba, F. Concari, and G. Spizzichino.
U.S. Patent No. 3,997,408, 10 p, 6 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 953, no 2, p 710, December 14, 1976.

Descriptors: *Patents, *Desalination, *Saline water, *Demineralization, *Waste water treatment, *Water purification, Separation techniques, Water softening, Equipment.
Identifiers: Steam compression.

A desalting apparatus operates on the principle of thermocompressione, otherwise known as steam-compression. In such apparatus the saline water is caused to flow on a heat-exchange surface; the temperature of the stream produced in this manner is increased by means of a compressor and the compressed stream is used to heat the heat-exchange surface by yielding its condensation heat. The condensate is recovered and provides soft water. The purity of the produced soft water depends upon the efficiency with which the steam is separated from its entrained microscopic droplets of the saline water. A specific object is to provide a thermocompression desalter in which fluted tubes may be utilized in the evaporator without a substantial risk of incrustations. The apparatus comprises: an evaporator section including a heating chamber and a bundle of evaporator tubes crossing the chamber; means for circulating saline water throught the tubes of the bundle including a separating chamber in which the steam produced in the evaporator section is separated from the non-evaporated saline water. A compressor delivers steam at an increased pressure to the heating chamber and condensate is recovered from the heating chamber. (Sinha-OEIS)

FORWARD OSMOSIS EXTRACTORS,
Arizona Univ., Tucson. School of Renewable Natural Resources.
C. D. Moody, and J. O. Kessler.
Desalination, Vol 18, p. 283-295, 1976. 1 fig, 14 ref.
OWRT B-053-ARIZ(2), 14-34-0001-7137.

Descriptors: *Water reuse, Kinetics, Design, Sea water, *Osmosis, *Desalination, *Waste water treatment, Model studies, Mathematical models, *Permselective membranes, *Separation techniques, Membrane processes.
Identifiers: *Forward osmosis.

Osmosis occurs when two solutions of differing osmolar concentrations are separated by a membrane permeable to the solvent but not (or nearly not) to the solutes. Derived is the relationship between the kinetics and design for the purpose of

applying this process to problems such as agricultural water reclamation, dehydration of solutions and the production of potable nutrient solutions from sea water. Three mathematical models that include increasingly complex fundamental process assumptions are presented. In all cases the fundamental mechanical device is assumed to be a continuous flow extractor that incorporates a semipermeable membrane.

OIL-FLUSHED TOILETS GAIN,
Compost Science, Vol. 18, No. 1, p 25, January-February, 1977.

Descriptors: *Domestic wastes, *Sanitary engineering, Oils, Odor, Bacteria, Viruses, Water utilization, Water conservation, Costs, Waste disposal.
Identifiers: *Oil-flushed toilets.

An oil-flushed toilet has been developed which uses no water for the disposal of body wastes. A colorless, low-viscosity mineral oil replaces water as the flushing medium. The oil and wastes are carried to a holding tank where oil floats to the top and water-saturated wastes sink. The oil is recycled to toilet tanks after filtration. There is no odor, and no bacterial or viral presence in this system. Domestic water savings have been estimated at 30-40% of the water piped into a home when this system is used. The system was installed at restrooms in the Rocky Mountain National Park, Colorado, when facilities were expanded. It was found to be less expensive than regular systems and more environmentally acceptable. It has reduced water pumping in the park buildings from a daily pumping to one pumping every 7 to 10 days. There has been no need to close comfort stations because of water shortages. Operation during early and late seasons can be attributed to the fact that oil does not freeze. Sewage production has been reduced from 14,000 gallons daily to 1,800 gallons per week. Costs have been reduced from 20 cents per flush with water to 2 per flush with the oil system. The ultimate disposal of wastes from the system can still be a problem. The wastes are usually trucked to a municipal treatment plant or to farmland for agricultural use, but a plan for producing methane gas from them is being studied. A system for marine applications is being adapted for use in high-rise buildings. Water from sink, basins, bathtub, and washing machines could be disposed to a smaller septic tank and drain field after filtration when this method is installed in domestic applications. (Collin

Dickinson Law Review, Vol 80, p 353-409 (Spring 1976). 351 ref.

Descriptors: *Power plants, *Thermal pollution, *Regulation, *Remedies, *Pennsylvania, Energy loss, Energy conversion, Dispersion, Ohio, Electric power, Federal government, State governments, River basin commissions, Electric powerplants, Water pollution sources, Heated water, *Consumptive use, Legal aspects, Interstate commissions.

The North Atlantic and Ohio regions have been identified as areas of potential water shortage for energy purposes, a problem which may exceed the ability of existing allocation doctrines and institutional schemes. The article identifies existing legal means of resolving conflicts between power plant water consumption and other uses; it considers the adequacy of available remedies, and covers regulatory programs art all levels of government which address these conflicts. The need for disposal of waste heat from power facilities poses a major challenge to our water resource laws which has not yet been effectively addresses. Antiquated state law necessitates protracted litigation. Sporadic legislative efforts which are anomlous and incomplete hamper effective Pennsylvania state regulation. Federal law leaves most facilities unregulated. Interstate river basin commission have attempted to tie power plant water use to comprehensive plans, however, much remains to be done. The ultimate solution lies in conservation of energy. The use of waste heat from power plants may be technologically impossible at this time; but in the future it will be imperative. In the interim we must use available laws to protect our water resources. (Molloy-Florida)

AN ANALYSIS OF AGRICULTURAL WATER REQUIREMENTS IN THE TAR-NEUSE RIVER BASIN OF NORTH CAROLINA,
North Carolina State Univ., Raleigh. Dept. of Biological and Agricultural Engineering.
R. S. Sowell, R. E. Sneed, and L. H. Chen.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-267 674, Price codes: A02 in paper copy, A01 in microfiche. Paper presented at ASAE 1976 Winter Meeting, Palmer House, Chicago, Ill., December 14-17, 1976. 18 p, 5 fig, 5 tab, 8 ref, Paper No 76-2529. OWRT B-068-NC(5). 14-31-0001-4114.

Descriptors: *Agricultural water, *Water demand, *Irrigation water, *Water requirements, Irrigation computer models, Irrigation efficiency, *North Carolina, *Water utilization.
Identifiers: *Agricultural water demand, Water use model, Irrigation policy, *Tar-Neuse River Basin(NC), Wake County(NC).

Agricultural water use has been increasing for several decades, with most of the increase being for irrigation. Computer models are available to quantify the effects of water availability and to study changes in various parameters and decisions on economic return. Two models were developed in this study with objectives as follows: (1) to determine total water requirements for a given level of agricultural activity in an area, and (2) to determine, for a limited quantity of water available to agriculture in an area, the optimum level of agricultural activity. These models are referred to as IRRI and the LP models respectively. One application of the IRRI model has been to determine the water requirements for irrigation of crops currently grown in a large region in Eastern N.C. The region is the Tar-Neuse River Basin and adjacent counties and includes a total of 35 counties. (Kiger-NC State)

Identifiers: Field experiments, *High water table soils.

A water management computer model is being developed to simulate the soil water regime for high water table soils. The model is based on a water balance in the soil profile. Approximate methods are used to evaluate infiltration, subsurface drainage, ET, subirrigation, and the soil water distribution within the profile. Inputs to the model are soil properties, parameters of the surface and subsurface drainage systems, and meteorological data. The model provides the capacity of predicting the response of the water table and the soil water regime above the water table to rainfall, ET, given degrees of surface and subsurface drainage, and the use of water table control or subirrigation practices. When finally tested and completed the model can be employed to evaluate alternative water management systems and operational procedures by simulating their performance over several years of record. Results of a field experiment to test the validity of the model are presented. Examples of the use of the model for water management system design and evaluation are given. (Stewart-NC State)

A SIMULATION OF AN IRRIGATION SCHEDULING MODEL WHICH INCORPORATES RAINFALL PREDICTIONS,
Auburn Univ., Ala. Dept. of Agricultural Engineering.
G. D. Stephens.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-268 092, Price codes: A06 in paper copy, A01 in microfiche. Master of Science Thesis, August 1975, 107 p, 27 fig, 5 tab, 35 ref, 4 append. OWRT A-025-ALA(4).

Descriptors: *Irrigation, *Forecasting, Evapotranspiration, *Soil moisture, Moisture stress, Evaporation, Rainfall, *Simulation analysis, Model studies, Cotton, Moisture tension, *Alabama.
Identifiers: Scheduling-with-forecasts, Scheduling-without-forecasts, *Irrigation scheduling models, Auburn(Ala).

A scheduling-with-forecasts model and a scheduling-without-forecasts model were developed and a sensitivity analysis was performed on the scheduling-with-forecasts model to test the effects of changes in the model inputs on model parameters and results. Weather and forecast data for the 1971-1973 growing seasons at Auburn were used in the models and daily values for the resulting available soil moisture, amount of irrigation applied, amount of excesses above the total available soil moisture capacity and amount of deficits below the critical available soil moisture level were determined for both the scheduling-with-forecasts and the scheduling-without-forecasts models. An analysis of these results showed that the scheduling-with-forecasts model using acceptance level of 0.50 significantly increased the

amounts of deficits over that obtained by the scheduling-withoutgforecasts model but did not significantly decrease the amounts of applied irrigation or excesses below that of the scheduling-without-forecasts model. A further study was made to determine the effects on model performance of changing the acceptance level in the scheduling-with-forecasts model. The optimum value for acceptance level was 0.80. The scheduling-with-forecasts model using acceptance level of 0.80 resulted in significant decreases in amounts of applied irrigation and excesses without significant increases in amounts of deficits over those resulting from the scheduling-without-forecasts model.

In: Proceedings of the NASA Earth Resources Survey Symposium, June 1975, Technical Session Presentations, Agriculture-Environment, Volume I-A. Report No. NASA TM X-58168. Symposium held June 9-12, 1975, Houston, Texas, p 221-232, September 1975. 8 fig, 2 tab, 3 ref.

Descriptors: *Vegetation, *Remote sensing, *Classification, *North Dakota, *Canada, Monitoring, Standing crops, Agriculture, Census, Crops, Grains(Crops), Surveys, Spatial distribution, Satellites(Artificial), Mapping, Areal, Evaluation, Measurement, Data processing, Analytical techniques.
Identifiers: *Saskatchewan(Canada), LANDSAT.

Agricultural crops identification and acreage determination analysis of LANDSAT digital data were performed in Williams County, North Dakota, and Melfort, Saskatchewan, Canada. A multispectral image processing and analysis system was utilized to perform the man-machine interactive analysis. The developed techniques yielded crop acreage estimate results with accuracy greater than 90% and as high as 99%. These results are encouraging evidence of agricultural inventory capabilities of machine-processed LANDSAT digital data. (See also W77-08408) (Humphreys-ISWS)

Identifiers: *San Joaquin Valley(Calif), LANDSAT.

In mid-1973, General Electric undertook a study of agricultural applications of remote sensing with a major agricultural firm. The study continued for eighteen months and covered the areas of crop monitoring and management as well as large-scale crop inventories. Pilot programs in the application of aircraft remote sensing and LANDSAT data were conducted. An operational aircraft survey program for ranch management has subsequently been implemented by the agricultural firm. LANDSAT data were successfully used to produce a 97% accurate inventory of cotton over 4.8 million acres of California's San Joaquin Valley. (See also W77-08408) (Humphreys-ISWS)

PRACTICAL APPLICATION OF REMOTE SENSING IN AGRICULTURE,
Anderson, Clayton and Co., Houston, Tex.
R. A. Phelps.
In: Proceedings of the NASA Earth Resources Survey Symposium, June 1975, Technical Session Presentations, Agriculture-Environment, Volume I-A. Report No. NASA TM X-58168. Symposium held June 9-12, 1975, Houston, Texas, p 239-242, September 1975. 10 ref.

Descriptors: *Remote sensing, *Agriculture, *Mapping, *Crops, *Arizona, Cotton, Aerial photography, Farm management, Vegetation, Spatial distribution, Molds, Satellites(Artificial).
Identifiers: LANDSAT.

During the past few years, Anderson, Clayton and Company has utilized in their remote sensing program imagery from several types of platforms from light aircraft to the LANDSAT (ERTS) satellites. Inexpensive imagery was preferred over expensive magnetic tapes. Emphasis was on practical application of remote sensing data to increase crop yield by decreasing plant stress, disease, weeds, and undesirable insects, and by improving irrigation. Imagery obtained from low altitudes via aircraft provided the necessary resolution and complements but did not replace data from high altitude aircraft, Gemini and Apollo spacecraft, Skylab space station, and LANDSAT satellites. Federal government centers are now able to supply imagery within about thirty days from date of order and deserve to be commended. Nevertheless, if the full potential of space imagery in practical agricultural operations is to be realized, the time span from date of imaging to user application needs to be shortened from the current several months to not more than two weeks. RELATIONSHIP BETWEEN CORN YIELD, EXPRESSED AS A PERCENTAGE OF MAXIMUM, AND THE N PERCENTAGE IN THE GRAIN. I. VARIOUS N-RATE EXPERIMENTS,
Iowa Agricultural and Home Economics Experiment Station, Ames.
W. H. Pierre, L. Dumenil, V. D. Jolley, J. R. Webb, and W. D. Shrader.
Agronomy Journal, Vol. 69, p 215-220, March-April 1977. 1 fig, 3 tab, 23 ref.

Descriptors: *Corn(Field), *Crop production, *Nitrogen, *Geographical methods, *Regression analysis, *Iowa, Model studies, Economic impact, Moisture stress, Productivity.
Identifiers: *Nitrogen percentage, Nitrogen sufficiency, Relative yield, Maximum yield.

A graphical method and a regression method were developed to relate corn (Zea mays L.) yield, expressed as a percentage of maximum, and the grain's N percentage. Data used came from 13 site-years of 6 N-rate experiments in Iowa and from previous literature. There was good agreement between the two methods for determining maximum yields and N percentages at various proportions of maximum yield. Average critical N percentages (those at maximum yield) were 1.52% for the graphical and 1.54% for the regression method in Iowa experiments. Data calculated from reported experiments were in general agreement with the Iowa results. Some variability in compared experimental results may have been attributable to differences among the 23 hybrids represented. There was little or no demonstrable effect on the relative yield-percent N relationship due to moisture stress, plant density or adequacy of other nutrients. That relationship offers a basis for estimating N sufficiency and the N requirement for maximum yield or an economic optimum yield. (Jahns-Arizona)

GROWTH OF TROPICAL AND TEMPERATE GRASSES AT PALMERSTON NORTH I. WARM-SEASON YIELDS WITH AND WITHOUT IRRIGATION,
Department of Scientific and Industrial Research, Palmerston North (New Zealand). Plant Physiology Div.
B. J. Forde, C. R. Slack, P. G. Roughan, and H. C. M. Whitehead.
New Zealand Journal of Agricultural Research, Vol. 19, No. 2, p 135-142, 1976. 5 tab, 16 ref.

Descriptors: *Grasses, *Crop production, *Photosynthesis, *Soil moisture, Irrigation, Tropical regions, Plant physiology, Leaves, Moisture tension, Field capacity, Fertilizers, Soil water, Irrigation effects, Water shortage, Bermudagrass, Flowering, Range management, Grazing, Temperate.
Identifiers: Paspalum, Kikuyu, *New Zealand.

Experiments were conducted on several species of grasses in New Zealand to determine the most suitable for highest yield of summer growth. Summer production of temperate grasses is limited by inadequate water supply, supra-optimal day temperatures and dormancy after spring flowering. In the warmer areas of New Zealand, the summer growing tropical grasses paspalum and kikuyu contribute significantly to annual pasture yields. Both, however, are difficult to manage. There are other tropical grasses which could possibly be cultivated in New Zealand. These grasses possess Carbon 4 photosynthesis pathways, whereas the temperate grasses fix carbon by the Carbon 3 pathway. Studies suggest that Carbon 4 pathway grasses may result in more economical use of available soil moisture. Warm season yields of 14 Carbon 4 photosynthetic pathway tropical grasses were compared with yields of 6 Carbon 3 pathway temperate grasses, and observations were made on the extent of flowering and on frost sensitivity and the results reported. Results show that tropical grasses can give a substantially higher yield over the summer than the temperate pasture grasses in current use. However, a more accurate assessment of the role of selected tropical grasses in New Zealand as perennial, summer-producing forage species must await further study. (Jamail-Arizona)

POTENTIAL OF NEW SUMMER GRASSES IN NORTHLAND: I. WARM-SEASON YIELDS UNDER DRYLAND AND IRRIGATION,
Department of Scientific and Industrial Research, Palmerston North (New Zealand). Plant Physiology Div.
A. O. Taylor, J. A. Rowley, and B. J. Hunt.
New Zealand Journal of Agricultural Research, Vol. 19, No. 2, p 127-133, 1976. 1 fig, 5 tab, 9 ref.

Descriptors: *Irrigation effects, *Range management, *Crop production, *Grasses, Pastures, Irrigation, Soil types, Irrigation efficiency, Droughts, Rainfall, Grazing, Tropical regions, Photosynthesis, Feeds, Plant growth, Evapotranspiration, Leaching.
Identifiers: Paspalum, Kikuyu.

The warm-season yield of a range of Carbon 4 photosynthetic pathway summer-growing tropical grasses was measured by mechanical harvesting over three seasons in small plot trials in New Zealand under high levels of nutrition and pest control. Several of the grasses produced higher yields than the naturalized summer grasses paspalum and kikuyu. Irrigation sufficient to replace evaporative water loss substantially increased the early summer production of all grasses but usually decreased their early autumn production. Leaching of soil nutrients may have been partially responsible for the poor autumn production under irrigation. The grasses varied widely in their relative yield response to irrigation. Production of all grasses persisted reasonably well under the five week harvest interval and 5 or 10 centimeter cutting height, although those with some degree of stoloniferous habit were generally better than bunch types. The experiments provide preliminary data on the yield potential of a range of Carbon 4 grasses in New Zealand and demonstrate that several types can maintain acceptable yields for at least three years in a coastal environment under lax cutting conditions. (Jamail-Arizona)

IMPROVING FOOD CROP PRODUCTION IN THE SUDAN SAVANNA ZONE OF NORTHERN NIGERIA,
Institute for Agricultural Research, Zaria (Nigeria).
A. H. Kassam, M. Dagg, J. M. Kowal, and F. H. Khadr.
Outlook on Agriculture, Vol. 8, No. 6, p 341-347, 1976. 2 fig, 1 tab, 45 ref.

Descriptors: *Crop production, *Water requirements, *Foods, *Rainfall, Africa, Crops, Precipitation(Atmospheric), Soil erosion, Agriculture, Droughts, Climates, Evaporation, Evapotranspiration, Soil moisture, Sorghum, Fertilizers, Farm management, Crop response.
Identifiers: *Nigeria(Sudan Savanna zone).

The potential for increasing food production in the Sudan Savanna of Northern Nigeria is discussed. This area has generally been considered marginal for crop production because of lack of available water, among other factors. However, studies have shown that the area has potential for food crop production. One of the main features of the Sudan agricultural zone is its low crop productivity per unit of land, which has not increased over the past thirty years or more. Economic and social pressures are making greater demands on soil resources of the area. There seems little doubt that the application of simple, but improved, technology can result in increased levels of production. The effects of improved crop science, mechanization, and climate on the area are discussed. The water requirements are outlined. The major crops grown, sorghum, millet, cowpea, and groundnuts, as well as diseases to which these crops are susceptible, are discussed. The conclusions presented suggest that better organization and more efficient methods should be applied to the problems faced by the region. (Jamail-Arizona)

HYDROLOGIC EFFECTS OF THE TAMPA BYPASS CANAL SYSTEM,
Geological Survey, Tallahassee, Fla. Water Resources Div.
L. H. Motz.
Florida Bureau of Geology, Tallahassee, Report of Investigations No 82, 1975. 42 p, 22 fig, 4 tab, 19 ref.

Descriptors: *Flood control, *Canals, *Diversion, *Florida, *Surface-groundwater relationships, Water levels, Aquifers, Hydrologic aspects, Hydrogeology, Model studies.
Identifiers: *Tampa Bypass Canal(Fla).

Flood water of the Hillsborough River will be diverted at a point upstream from areas of floodplain encroachment in the cities of Tampa and Temple Terrace into nearby McKay Bay by means of the Tampa Bypass Canal System, which is being built through an area east of Tampa. The canal system will breach the underying artesian Floridan aquifer in places where the potentiometric surface is at or near land surface, causing drawdowns over a wide area and diverting flow from other parts of the hydrologic system. A water-control structure would maintain the pool level in the Eureka Springs and Harney Flats areas at a significantly higher level than without the structure, reducing drawdowns in and discharge from the Floridan aquifer in these areas. The canal system, as presently designed, will lower water levels in the Floridan aquifer by 1.0 foot or more over a 50 to 90 square mile area and will result in a discharge from the aquifer into the canal system of about 13 to 22 mg. This discharge will be equal to a decrease in the discharge from other parts of the hydrologic system. By adding an additional control structure near Buffalo Avenue, the affected area could be reduced 45 to 50 percent, and the discharge could be reduced 40 to 45 percent. (Woodard-USGS)

ASPHALT-RUBBER MIXTURES FOR SEEPAGE CONTROL,
Arizona Univ., Tucson. Dept. of Civil Engineering and Engineering Mechanics.
R. M. Kalash.
M.S. Thesis, 1977. 81 p, 24 fig, 5 tab, 25 ref, 2 append. OWRT A-075-ARIZ(1). 14-34-0001-7006.

Descriptors: *Seepage control, Water harvesting, *Asphalt, *Rubber, Water conservation, Testing procedures, Physical properties, Permeability, Membrane, Adsorption, Viscosity, Tensile strength, Water yield improvement.
Identifiers: *Waterproof membranes.

A laboratory investigation was made of asphalt-rubber for use in water seepage control applications. Laboratory testing utilized for physical property determinations included viscosity, creep (tensile), ductility (ASTM D113-74), water vapor transmission (ASTM E96-72), Procedure Bw), water absorption (ASTM 570-72), and permeability. The results showed that the asphalt-rubber is relatively impermeable as a membrane. Physical properties of the base asphalt that are increased with the addition of rubber include water absorption and viscosity. The test that exhibited lower physical property values was ductility. Compared with plain asphalt, creep (tensile) test results showed that the rate of deformation of asphalt-rubber mixtures depends on the magnitude of the tensile load applied.

IMPLEMENTATION OF AN OPTIMIZATION MODEL FOR OPERATION OF A METROPOLITAN RESERVOIR SYSTEM,
Southern Methodist Univ., Dallas, Tex. School of Engineering and Applied Science.
M. A. Collins.
Water Resources Bulletin, Vol. 13, No. 1, p 57-70, February 1977. 6 tab, 19 ref. OWRT C-3355(3739)(5).

Descriptors: *Reservoirs, *Operations, *Optimization, *Dynamic programming, *Economic efficiency, Water supply, Computer models, Reservoir releases, Equations, Operations research, Water distribution(Applied), Simulation analysis, *Texas.
Identifiers: *Dallas reservoir system(Tex), *Multiple reservoirs, *Optimal operation, Sectioning search, Water withdrawal, Cost minimization.

A deterministic dynamic programming optimization model with a refining sectioning search procedure is developed and implemented to derive minimum cost withdrawal and release patterns for water supply from a multiple reservoir system serving the Dallas metropolitan area. Applications are made to the four reservoir system operated by this city. A realistic cost structure, including non-linear power consumption, block rate unit power costs, and flow dependent power consumption for intracity water distribution, is utilized. Applications are made to find least cost operating patterns and, as well, by inclusion of a water loss penalty function supply patterns which will reduce evaporation water losses for the Dallas system. The model is viewed as an envolved tool which can be refined and improved as greater familiarity with it is gained by City personnel. (Bell-Cornell).

A large number of short but severe floods have occured in the watershed of the small brook of Dison. Therefore, the authorities have decided to undertake important flood control measures. Engineers affiliated with interested bodies have been enlisted to carry out preliminary studies and to forecast maximum discharges. Furthermore, the legal action brought by certain riverside residents has resulted in several investigations and surveys. Although rainfall measurements in the studied region have been sufficiently numerous, the same cannot be said for maximum discharges, which have been estimated indirectly. In this situation, it is necessary to synthesize the general data available. (See also W77-01933) (Humphreys-ISWS)

FROM GOOD HUSBANDRY TO REASONABLE USE: ILLINOIS SURFACE WATER DRAINAGE LAW EVOLVES IN SUBDIVISION CASE,
J. Fry.
Chicago-Kent Law Review, Vol 52, No 1, p 169-83, 1975.

Descriptors: *Illinois, *Surface drainage, *Natural flow doctrine, *Reasonable use, *Diversion, Urban drainage, Relative rights, Agricultural ru-

noff, Urban runoff, Urban sociology, Legal aspects, Riparian rights, Water law, Water rights, Natural flow, Flow, Alteration of flow, Surface runoff, Central U.S.
Identifiers: *Absolute liability, *Common enemy rule, Good husbandry exception.

Until the recent Illinois Supreme Court decision of Templeton v. Huss, the natural flow rule governed the drainage of unwanted surface water. This civil law rule imposed strict liability for injury to another's land resulting from any interference with the natural flow of surface waters. However, since the rule impeded agricultural development the Illinois court declared a good husbandry exception. The exception allowed for an increase in drainage to improve and till higher lands, but strictly prohibited diversion from the natural course of drainage. Proof of diversion was essential to recovery unless the increased drainage flow totally destroyed the lower lands. Huss appears to modify the natural flow rule by implementing a policy of reasonable use, which negates the necessity for proof of diversion. This policy shifts the emphasis from one favoring agricultural development to one in which the interests of both the developer and those harmed by the development are balanced. However, the balancing test will not be applicable in all drainage situations since the holding only involved an urban subdivider's liability, and therefore cannot be extended to agricultural development. This article explores possible factual applications of the holding and interpretation of the test employed. (Anderson-Florida)

A NEW MEASURE OF DAMAGE FOR WRONGFULLY APPROPRIATED WATER,
R. R. Douglas.
Arizona State Law Journal, Vol 1975, p 565-84 (1975). 129 ref.

Descriptors: *Prior appropriation, *Preferences(Water rights), *Remedies, *Penalties(Legal), Legal aspects, Water law, Water rights, Diversion, Legislation, Judicial decisions, Priorities, Water resources development, Management, Alternative water use, Economics, Alternative costs, State governments, Regulation.
Identifiers: Taking(Legal), Presumptive damage rate.

The author examines traditional water law damage measures, and analyzes their strengths and shortcomings, and suggests possible alternatives. While public policy in the west has long approved the prior appropriator, judicially established and enforced damage measures for wrongful deprivations of water have often, at least tacitly, favored illegal takings. Damages for permanent deprivations have not been carried to their logical legal conclusion. The measures for temporary takings have tied water values to land values and have failed to recognize alternative uses of the water right. It is suggested that a water right be valued in its highest and best use and that strict liability should be imposed for the taking or destruction of a water right. Alternatively, a system for establishing a presumptive damage measure at the going rate for water in a given area is proposed. Finally, the equities and convenience of application of the proposed new measures are discussed and contrasted with present damage measures. A presumptive damage rate based on the established cost of water in the area would provide realistic relief for the deprivation of water rights protected by the state's constitution and statutes. ESTIMATING VEGETATIVE BIOMASS FROM LANDSAT-1 IMAGERY FOR RANGE MANAGEMENT,
Nebraska Univ., Lincoln. Conservation Survey Div.
P. M. Seevers, J. V. Drew, and M. P. Carlson.
In: Proceedings of the NASA Earth Resources Survey Symposium, June 1975, Technical Session Presentations, Agriculture-Environment, Volume I-A. Report No. NASA TM X-58168. Symposium held June 9-12, 1975, Houston, Texas, p 1-8, September 1975. 1 fig, 2 tab, 6 ref.

Descriptors: *Estimating, *Range management, *Nebraska, *Remote sensing, *Vegetation regrowth, Vegetation, Agriculture, Measurement, *Biomass, Management, Land use, Mapping, Vegetation establishment, Data processing, Ranges, Grasses, Range grasses, Satellites(Artificial).
Identifiers: *LANDSAT.

Evaluation of LANDSAT-1, band 5 data for use in estimation of vegetative biomass for range management decisions was carried out for five selected range sites in the Sandhills region of Nebraska. Analysis of sets of optical density-vegetative biomass data indicated that comparisons of biomass estimation could be made within one frame, but not between frames without correction factors. There was high correlation among sites within sets of radiance value-vegetative biomass data and also between sets, indicating that comparisons of biomass could be made within one frame, but not between frames without correction factors. There was high correlation among sites within sets of radiance value-vegetative biomass data and also between sets, indicating that comparisons of biomass estimation could be made within one frame, but not between frames without correction factors. There was high correlation among sites within sets of radiance value-vegetative biomass data and also between sets, indicating that comparisons of biomass could be made within and between frames. LANDSAT-1 data were shown to be a viable alternative to currently used methods of determining vegetative biomass production and stocking rate recommendations for Sandhills rangeland. To be of maximum benefit, however, LANDSAT data must be available to decision makers within seven to ten days after acquisition. (See also W77-08408) (Humphreys-ISWS)

DISCRIMINATING COASTAL RANGELAND PRODUCTION AND IMPROVEMENTS WITH COMPUTER AIDED TECHNIQUES,
Lockheed Electronics Co., Inc., Houston, Tex. Aerospace Systems Div.
C. A. Reeves, and D. P. Faulkner.
In: Proceedings of the NASA Earth Resources Survey Symposium, June 1975, Technical Session Presentations, Agriculture-Environment, Volume I-A. Report No. NASA TM X-58168. Symposium held June 9-12, 1975, Houston, Texas, p 9-17, September 1975. 4 fig, 4 ref.

Descriptors: *Range management, *Remote sensing, *Texas, *Coasts, Coastal marshes, Land use, Vegetation, Classification, Data processing, Satellites(Artificial), Ranges, Mapping, Measurement, Computers.
Identifiers: LANDSAT.

This study successfully demonstrated that broad rangeland types can be accurately separated to acceptable levels on LANDSAT bulk data with a computer aided classification procedure. Although this was a pilot study, the output classification could be used by land managers as an input to their rangeland inventory. It was also determined that this first step just 'scratched the surface' in extracting inventory information. A second step to further refine the classification is needed to differentiate improved pastures from the native rangelands. A third step would be to monitor changes as native rangelands are converted to improved pastures and as climatic or seasonal aspects influence these lands. These steps are necessary for the development of a dynamic model based on inputs from remotely sensed data and to predict variations in carrying capacity of rangelands as affected by seasonal variations and range improvement practices. This model could take advantage of the unique multispectral and repeat coverage characteristics of the LANDSAT type satellites. The product of this model have the potential of aiding the range manager to become a more efficient and more accurate decision maker at lower cost. (See also W77-08408) (Humphreys-ISWS)
W77-08410

USEFULNESS OF LANDSAT DATA FOR MONITORING PLANT DEVELOPMENT AND RANGE CONDITIONS IN CALIFORNIA'S ANNUAL GRASSLAND,
Geological Survey, Sioux Falls, S. Dak. EROS Data Center.
D. M. Carneggie, S. D. DeGloria, and R. N. Colwell.
In: Proceedings of the NASA Earth Resources Survey Symposium, June 1975, Technical Session Presentations, Agriculture-Environment, Volume I-A. Report No. NASA TM X-58168, Symposium held June 9-12, 1975, Houston, Texas, p 19-41, September 1975. 5 fig, 10 ref, 3 plate.

Descriptors: *Range management, *Grasslands, *Remote sensing, *California, Monitoring, Ranges, Land use, Vegetation, Growth rates, Growth stages, Mapping, Forages, Plant growth, Data processing, Satellites(Artificial).
Identifiers: LANDSAT.

LANDSAT imagery and magnetic tapes were analyzed to determine their utility for monitoring and assessing range condition within the annual grassland in California. LANDSAT data, forage samples at selected range sites, and ground spectral reflectance data were all examined in order to verify the usefulness of LANDSAT imagery (1) for determining range condition and growth stage, and (2) for assessing relative forage production. The results of ground spectral reflectance data compared with green forage production data showed a close correspondence between spectral reflectance ratios and green biomass. Changes in ground spectral reflectance data also correspond with observed changes in growth stage and condition of the forage species. Moreover, LANDSAT spectral reflectance data provides quantitative signals of significant growth stages in the development of annual forage species. Relative differences in forage production are also indicated by the LANDSAT spectral radiance data. Provided that cloud-free LANDSAT coverage is available during critical growth stages of the annual plants,

LANDSAT data can be used to: (1) assess differences in range condition on a regional basis; (2) compare differences in production between grazing regions for a given year; and (3) compare differences in condition and production for a given site between years. Moreover, the length of the green feed period can be determined; and this information, along with ground samples of forage production and climatic data, can provide the inputs to simple models for estimating forage production or for determining the remaining length of the green feed period beyond a definable threshold date late in the growth cycle of the annuals. MONITORING VEGETATION CONDITIONS FROM LANDSAT FOR USE IN RANGE MANAGEMENT,
Texas A and M Univ., College Station.
R. H. Haas, D. W. Deering, J. W. Rouse, Jr., and J. A. Schell.
In: Proceedings of the NASA Earth Resources Survey Symposium, June 1975, Technical Session Presentations, Agriculture-Environment, Volume I-A. Report No. NASA TM X-58168. Symposium held June 9-12, 1975, Houston, Texas, p 43-52, September 1975. 1 fig, 1 tab.

Descriptors: *Range management, *Remote sensing, *Vegetation, *Texas, *Great Plains, Monitoring, Growth stage, Forages, Plant growth, Analytical techniques, Mapping, Ranges, Satellites(Artificial), Statistics.
Identifiers: LANDSAT.

A summary of the LANDSAT Great Plains Corridor projects and the principal results were presented. Emphasis was given to the use of satellite acquired phenological data for range management and agri-business activities. A convenient method of reducing LANDSAT MSS data to provide quantitative estimates of green biomass on rangelands in the Great Plains was explained. A Transformed Vegetation Index (TVI6), which is useful for detection and quantitative assessment of green biomass differences, was developed. Detailed statistical analysis showed that the TVI6 parameter, along with limited weather data, is adequate to quantatively assess rangeland feed conditions. The ability to estimate green biomass in increments of 250 to 300 kg/ha with a 95% probability from TVI6 data and readily available weather data was indicated. (See also W77-08408) (Humphreys-ISWS)

ARE CLEAR-CUT AREAS ESTIMATED FROM LANDSAT IMAGERY RELIABLE,
Pacific Forest Research Centre, Victoria (British Columbia).
Y. J. Lee.
In: Proceedings of the NASA Earth Resources Survey Symposium, June 1975, Technical Session Presentations, Agriculture-Environment, Volume I-A. Report No. NASA TM X-58168. Symposium held June 9-12, 1975, Houston, Texas, p 105-114, September 1975. 7 fig, 1 tab, 3 ref.

Descriptors: *Clear-cutting, *Lumbering, *Canada, *Remote sensing, Forest management, Areal, Estimating, Data processing, Satellites(Artificial), Mapping, Surveys.
Identifiers: LANDSAT.

The reliability of LANDSAT imagery for estimation of clear-cut areas was evaluated by comparison with data obtained from high-altitude photos, logging historical maps, and from field inspections. A mature forest, owned by Pacific Logging Company, was selected as a test site because of its continuous clear-cut operation. The forest is about 50 km northwest of Victoria, British Columbia, Canada, and consists of 9092 ha. Ground truth was based on high-altitude photos and the Pacific Logging Company Logging History Map for 1973, with a scale of 1:63,360. LANDSAT imagery from band 5, recorded by multispectral scanner, was obtained on September 4, 1972 and on August 12, 1973. Areas clear-cut within the past year were overestimated by 12.9% (105 ha), those clear-cut 1-year or more by 2.2% (76 ha), whereas uncut mature timber was underestimated by 3.6% (176 ha). Three clear-cut areas were missed in the company map and two in the LANDSAT enhancement. The difference between area estimates was significant when all 26 areas were included, but not when 2 overestimated areas were excluded from the analysis. The ability to identify the status and to estimate the size of current and past clear-cutting activity has been definitely established. The acreages for clear-cut and uncut mature timber determined from LANDSAT imagery are reliable, and the LANDSAT color enhancement technique is a useful tool in up-dating clear-cut areas for long-term planning in forest management. TIMBER TYPE SEPARABILITY IN SOUTHEASTERN UNITED STATES ON LANDSAT-1 MSS DATA,
Lockheed Electronics Co., Inc. Houston, Tex.
E. P. Kan, and R. D. Dillman.
In: Proceedings of the NASA Earth Resources Survey Symposium, June 1975, Technical Session Presentations, Agriculture-Environment, Volume I-A. Report No. NASA TM X-58168. Symposium held June 9-12, 1975, Houston, Texas, p 135-157, September 1975. 7 fig, 3 tab, 19 ref. NASA NAS 9-12200.

Descriptors: *Forest management, *Pulp and paper industry, *Remote sensing, *Southeast U.S., *Texas, Mapping, Lumber, Lumbering, Softwood, Hardwood, Classification, Data processing, Analytical techniques, Photogrammetry, Forestry, Forests, Land use, Industrial crops, Satellites(Artificial), Vegetation regrowth.
Identifiers: LANDSAT.

A quantitative, computer-aided study was made on the spectral separability of timber types and condition classes in the Southeastern United States, using LANDSAT-1 multispectral scanner data. Conclusions were obtained on accuracies at different levels of mapping detail and the choice of parameters affecting mapping accuracies, such as spectral bands, number of bands, and seasons of data. It was concluded that LANDSAT-1 could be used effectively to discriminate the gross forest features of softwood, hardwood, and regeneration. The only significant detectable age difference would be between an established forest and a young (or denuded) forest, i.e., regeneration. The red or near infrared bands would be better for discrimination; phenological early and late spring data would be better than winter (summer and autumn data were not available for analysis). A temporal analysis would be superior to single-season analysis. Lastly, two spectral bands would be most cost effective for computer analysis. The study site, Sam Houston National Forest of East Texas, is a typical forest in the Flatwoods Zone, Southern Region, U.S. Forest Service. The widely accepted computer scheme of training-field, maximum likelihood classifier was employed, while cross-classification accuracies and divergence measures were computed to evaluate timber type separability. Descriptors: *Forest management, *Remote sensing, *Mapping, *Mississippi, Aerial photography, Forests, Vegetation, Spatial distribution, Land use, Plant groupings, Classification, Trees, Canopy, Analytical techniques, Training.

The use of aircraft 24-channel multispectral scanner data in conjunction with computer processing techniques to obtain an automated classification of plant species associations was discussed. The classification of various plant species associations was related to information needed for specific applications. In addition, the necessity of multiple selection of training fields for a single class in situations where the study area consists of highly irregular terrain was detailed. It was mentioned that a single classification will be illuminated differently in different areas, resulting in the existence of multiple spectral signatures for a given class. These different signatures result because different qualities of radiation upwell to the detector from portions that have differing qualities of incident radiation. Techniques of training field selection were outlined, and a classification obtained from a natural area in Tishomingo State Park in north Mississippi was presented. WILDLIFE MANAGEMENT BY HABITAT UNITS--A PRELIMINARY PLAN OF ACTION,
C. D. Frentress, and R. G. Frye.
In: Proceedings of the NASA Earth Resources Survey Symposium, June 1975, Technical Session Presentations, Agriculture-Environment, Volume I-A. Report No. NASA TM X-58168. Symposium held June 9-12, 1975, Houston, Texas, p 245-262, September 1975. 4 fig, 34 ref, 2 append.

Descriptors: Wildlife habitats, *Remote sensing, *Texas, *Land use, Mapping, Vegetation, Trees, Classification, Management, Wildlife management, Environment, Maps, Spatial distribution, Oak trees, Juniper trees, Aerial photography, Satellites(Artificial), Analytical techniques.
Identifiers: *Travis County(Tex), LANDSAT.

The Texas Parks and Wildlife Department recognizes the need for managing populations of wildlife species by defined area units. A data stratification scheme is required to investigate species populations for the purpose of identifying unit boundaries. Vegetation type maps are commonly used to stratify data collection points and, subsequently to delineate boundaries of homogeneous populations. Procedures for yielding vegetation type maps were developed, using LANDSAT data and a computer assisted classification analysis (LARSYS) developed by Purdue University. Ground cover in Travis County, Texas, was classified on two occasions, using a modified version of the unsupervised approach to classification. The first classification produced a total of 17 classes. Examination revealed that further grouping was justified. A second analysis produced 10 classes which were displayed on printouts which were later colorcoded. The final classification was 82% accurate. While the classification map appeared to satisfactorily depict the existing vegetation, two classes were determined to contain significant error. A review of the procedures indicated that the major sources of error could have been eliminated by stratifying cluster sites more closely among previously mapped soil associations that are identified with particular plant associations. This could have served as a safeguard to prevent overlooking a vegetational class. (See also W77-08408) (Humphreys-ISWS)

THE RATIONALE FOR ATTEMPTING TO DEFINE SALT MARSH MOSQUITO-BREEDING AREAS IN GALVESTON COUNTY BY REMOTE SENSING THE ASSOCIATED VEGETATION.
Lockheed Electronics Co., Houston, Tex.
G. K. Arp.
In: Proceedings of the NASA Earth Resources Survey Symposium, June 1975, Technical Session Presentations, Agriculture-Environment, Volume I-A. Report No. NASA TM X-58168. Symposium held June 9-12, 1975, Houston, Texas, p 289-299, September 1975. 2 tab, 23 ref.

Descriptors: *Salt marshes, *Insect control, *Mosquitos, *Remote sensing, *Texas, Mapping, Environment, Grasses, Vegetation, Marsh plants, Aerial photography, Entomology, Surveys, Wetlands, Aquatic plants.
Identifiers: *Galveston County(Tex).

This paper concerned the rationale for attempting to define salt marsh mosquito breeding areas in Galveston County, Texas. It concluded a botanical survey of the marsh plant communities, their relationship to flooding, and their exposure to salt water. Particular emphasis was given to Distichilis spicata, a widespread marsh grass. Evidence suggests that breeding areas of Aedes sollicitans, salt marsh mosquitos, are associated with Distichlis, and that both species respond to similar ecological conditions in the salt marsh. Analysis of the Galveston salt marsh community revealed five major plant associations, ranging from sea level to 91 cm (3 ft) in elevation. The associations are Spartina alterniflora, Distichlis spicata, Spartina patens, salt flats, and Spartina spartinae. From aircraft overflights at various altitudes, characteristics that identify Distichlis spicata and Spartina patens were defined. These characteristics may be used in identifying the associated mosquito-breeding areas either visually or by remote sensing, (See also W77-08408) (Humphreys-ISWS)

Identifiers: LANDSAT.

The Satellite Applications Laboratory of the University of Kansas Space Technology Center has carried out since April 1972 a program designed to assist decision makers in local, state, and regional agencies in the application of remote sensing techniques to their activities. To date, twenty projects have been initiated in support of 29 separate municipal, county, regional, and state agencies or entities. Several data products have been prepared for the use of these agencies based on LANDSAT imagery: high altitude color, color infrared, and multispectral black and white photography; and imagery from a Hasselblad camera cluster flown in the University's aircraft. Projects organized in the six sequential phases of contact, project definition, project initiation, on-going project, project completion, and continuing support were designed to demonstrate the utility of remote sensing in the context of the user agency. After reviewing these phases, four projects were detailed to illustrate the methods and results of applications projects. Two of these projects have resulted in single user decisions during 1974 related to: (1) completion of an interstate highway and cancellation of construction plans for a large reservoir, and (2) zoning changes around a smaller reservoir. Two on-going projects were also discussed: (1) a multi-user project related to the expansion of irrigation in Kansas, and (2) a program of activities leading to incorporation of remote sensing into the data acquisition methods of Kansas City, Kansas. DRAINABLE POROSITY EVALUATION AND ITS RELATIONSHIP TO HYDRAULIC CONDUCTIVITY AND EXCHANGEABLE CATIONS UNDER DIFFERENT BULK DENSITIES,
Alexandria Univ. (Egypt). Dept. of Soil and Water Sciences.
M. I. Fahmy, M. El-Said, and Y. Z. El-Shafei.
Alexandria Journal of Agricultural Research, Vol. 23, No. 1, p 183-197, April, 1975. 8 fig, 2 tab, 16 ref.

Descriptors: *Moisture tension, *Hydraulic conductivity, *Porosity, *Drainage, *Bulk density, Conductivity, Cations, Density, Physical properties, Soil types, Sands, Clays, Saline soils, Salinity, Clay loam.
Identifiers: *Drainage porosity, Egypt.

Drainage is an important practice for normal agriculture and for reclaiming saline soils. A study was conducted to find a feasible method for evaluating drainable porosity by implementing the moisture-tension curve of soil, and to investigate its relationship to hydraulic conductivity, bulk density and exchangeable cations of different soils of Egypt. A clay soil, a calcareous soil, and sandy soil from different regions in Egypt were planted in corn and cotton and measurements taken. The results are presented. The relationship between drainable porosity and hydraulic conductivity showed an exponential proportionality for the disturbed clay soils but a linear one for the disturbed calcareous and sandy soils. It has been found that drainage porosity should be maintained at higher than ten percent to yield high production. Compaction reduced both values of drainable porosity and hydraulic conductivity for either disturbed or undisturbed sample. (Jamail-Arizona).

COMPUTER PROGRAM FOR RESERVOIR-WATER BUDGETS,
Agricultural Research Service, Chickasha Okla. Southern Great Plains Watershed Research Center.
R. R. Schoof.
USDA Publication No. ARS-S-161, April 1977. 32 p, 6 fig, 3 tab, 8 append.

Descriptors: *Runoff, *Reservoirs, *Flow control, *Computer programs, Discharge(Water), Base flow, Evapotranspiration, Hydrology, Seepage, Spillways, Dam, Inflow, Water storage, *Hydrologic budget.
Identifiers: Floodwater-retarding reservoirs, Reservoir water budget, FORTRAN IV.

A computer program for computing reservoir-water budgets is presented. The program was designed for floodeater-retarding reservoirs, but the system is applicable to all water-storage reservoirs where there is a need for computation and tabulation of water input, output, and change in storage. Discussions of the computing procedure, input and output formats, and data-editing routine are included. Flow charts of the main program and two of the subroutines, complete FORTRAN listings, and symbol definitions are also included. (ARS).

DEEP WATER RESOURCES OF THE LIMESTONES OF FRANCHE-COMTE: PROBLEMS OF QUANTITY AND QUALITY, (IN FRENCH),
M. Dreyfuss.
Ann Sci Univ Besancon Geol. 18, p87-95, 1973.

Descriptors: Water quality, *Limestone, Groundwater, *Water pollution sources, *Groundwater resources, Water sources, Water supply, *Chemical compounds.
Identifiers: *France(Franche-Comte).

There are large reserves of deep water in the limestones of Franche-Domte, France, of the order of several billion m3 or a volume about equivalent to that yielded by the rivers yearly, but the exploitation of these reserves presents several difficulties. Bores placed haphazardly in a favorable zone but not reaching a subterraneous circulation yield a limited output. As to quality, the water contains many stable soluble chemical compounds which may at times be dangerous. The plateaux and mountains above these water sources are inhabited; there are agricultural enterprises, industry and tourism. The zones of access by possibly polluted water additions must be avoided, and the quality of the water for human consumption must be carefully studied.--Copyright 1975, Biological Abstracts, Inc.

WATER RESOURCES OF THE MYAKKA RIVER BASIN AREA, SOUTHWEST FLORIDA,
Geological Survey, Tallahassee, Fla. Water Resources Div.
B. F. Joyner, and H. Sutcliffe, Jr.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-264 768, Price codes: A05 in paper copy, A01 in microfiche. Water-Resources Investigations 76-58, December 1976. 87 p, 18 fig, 7 tab, 38 ref.

Descriptors: *Groundwater resources, *Surface waters, *Water quality, *Florida, Aquifer characteristics, Water table aquifers, Artesian aquifers, Water wells, Water yield, Water supply, Chemical analysis, Groundwater movement, Surface-groundwater relationships, Streamflow, Lakes.
Identifiers: *Myakka River basin(Fla).

Ground water in the Myakka River basin area of southwest Floria is obtained from a water-table aquifer and from five zones in an artesian aquifer. Wells in the water-table aquifer yield generally less than 50 gpm and dissolved solids concentration is less than 500 mg/liter except in coastal areas and the peninsula southwest of the Myakka River estuary. Wells in the Venice area that tap zone 1 usually yield less than 30 gmp. The quality of water is good except in the peninsula area. Zone 2 is the most highly developed aquifer in the heavily populated coastal areas. Wells yield as much as 200 gpm. In most areas, water is of acceptable quality. Wells that tap zone 3 yield as much as 500 gmp. Fluoride concentration ranges from 1 to 3.5 mg/liter. Zone 4 yields as much as 1,500 gpm to large diameter wells. Except in the extreme northeastern part of the area water from zone 4 usually contains high concentrations of fluoride and sulfate. Zone 5 is the most productive aquifer in the area, but dissolved solids concentrations usually are too high for public supply except in the extreme northeast. Surface water derived from natural drainage is of good quality except for occasional high color in summer. Most of the streams in the Myakka River basin area have small drainage basins, are of short channel length, and do not yield high volumes of flow. During the dry season, streamflow is maintained by groundwater discharge, and, as a result, chloride, sulfate, and dissolved solids concentrations and the hardness of the water are above drinking water standards for some streams. (Woodard-USGS)

GROUND-WATER RESOURCES OF VANDERBURGH COUNTY, INDIANA,
Geological Survey, Reston, Va. Water Resources Div.; and Geological Survey, St. Paul, Minn. Water Resources Div.
L. W. Cable, and R. J. Wolf.

Indiana Department of Natural Resources, Indianapolis, Bulletin No 38 of the Division of Water, 1977. 37 p, 19 fig, 3 plates, 3 tab, 17 ref.

Descriptors: *Groundwater resources, *Groundwater availability, *Aquifer characteristics, *Water quality, *Indiana, Hydrologic data, Hydrogeology, Water yield, Transmissivity, Geophysics, Maps, Groundwater discharge, Water analysis, Chemical analysis.
Identifiers: Vanderburgh County(Ind).

Sandstone units of Middle and Late Pennsylvanian age and sand and gravel of Quaternary age are the source of fresh (1,000 parts per million of dissolved solids or less) ground water in Vanderburgh County, Indiana. Aquifers occur in older rocks, but, owing to their depth, the water is too highly mineralized to be useful for most purposes. Sand and gravel deposits of the Ohio River Valley are the best aquifer in Vanderburgh County. These deposits form a single hydrologic unit referred to as the Ohio River valley aquifer. This is the only aquifer in the county capable of accommodating high-yield wells. Properly constructed wells in this aquifer could easily yield 1,000 gallons per minute and more. Transmissibilities in the Ohio River valley aquifer range from 120,000 gallons per day per foot and less near the valley walls to more than 200,000 gallons per day per foot in the thickest parts of the aquifer. The water in the aquifer is predominately a very hard calcium bicarbonate type having a high iron content. (Woodard-USGS)

GROUND WATER IN THE SAN JUAN METROPOLITAN AREA, PUERTO RICO,
Geological Survey, Fort Buchanan, Puerto Rico. Water Resources Div.
H. R. Anderson.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-264 414/AS, Price codes: A06 in paper copy, A01 in microfiche. Water-Resources Investigations 41-75, July 1976. 34 p, 15 fig, 3 tab, 24 ref.

Descriptors: *Groundwater resources, *Aquifer characteristics, *Water yield, *Water quality, *Puerto Rico, Water wells, Water supply, Water utilization, Surface-groundwater relationships.
Identifiers: *San Juan area(PR).

Ground water in the San Juan, Puerto Rico, area has played a declining role in water supply since the completion of the Lofza reservoir project in the early 1950's. Ground-water potential is limited because of the small size of the aquifers and susceptibility to seawater intrusion. Of the 30 million gallons per day about half is being used. Two water-bearing zones are present: an artesian aquifer, composed of the San Sebastian Formation and the lower Cibao Formation that yields an average of 244 gallons per minute to wells; and, a water-table aquifer composed of the upper Cibao Formation and the Aguada and Aymamon Limestones that yields an average of 515 gallons per minute to wells. Ground water is less mineralized inland and in the artesian aquifer. Mean concentrations of dissolved solids are 363 milligrams per liter for the artesian aquifer and 525 milligrams per liter for the water-table aquifer. (Woodard-USGS)

GEOHYDROLOGY OF THE ALBIN AND LA GRANGE AREAS, SOUTHEASTERN WYOMING,
Geological Survey, Cheyenne, Wyo. Water Resources Div.
W. B. Borchert.
Water-Resources Investigations 76-118 (Open-File Report), November 1976. 72 p, 20 fig, 4 tab, 27 ref.

Descriptors: *Aquifer characteristics, *Water level fluctuations, *Irrigation wells, *Observation wells, *Pumping, Drawdown, Groundwater recharge, Hydrogeology, Well data, Borehole geophysics, Surface-groundwater relationships, Groundwater movement, Water quality, Chemical analysis, Subsurface mapping, *Wyoming.
Identifiers: Southeastern Wyoming.

The Albin and La Grange areas in southeastern Wyoming are two adjoining different hydrologic areas. Since ground water is the only source of water for irrigation in the Albin area, 34 irrigation wells have been drilled since 1968 and developed in conjunction mostly with center-pivot sprinkler systems that in 1974 irrigated about 6,980 acres. Most irrigation wells are developed in channel deposits of the Ogallala Formation of late Miocene. Water levels in parts of these channel deposits have declined about 4 to 7 feet since pumping began in 1968. In the La Grange area, lands are irrigated by surface water, ground water or a combination of both. The best producing wells are those completed in both the Brule Formation of Oligocene age and the alluvium. Secondary porosity was located and elevated in the Brule using caliper logs, an Acoustic Borehole Televiewer and geophysical logs. From the spring of 1970 to the spring of 1974, hydrographs of wells in parts of the La Grange area show water-level rises of about 5 feet resulting from the net effect of surface-water recharge and groundwater pumpage. Throughout the La Grange area no significant annual water-table declines have occurred. It is unlikely that irrigation wells pumping near Horse Creek have caused significant direct streamflow depletion. (Woodard-USGS)

EFFECT OF DIP ON THE SUBSURFACE STORAGE OR DISPOSAL OF FLUID IN SALINE AQUIFERS,
Louisiana Water Resources Research Inst., Baton Rouge.
J. A. D'Amico.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-267 747, Price codes: A06 in paper copy, A01 in microfiche. M.S. Thesis, August 1975. 103 p, 15 fig, 8 tab, 21 ref, 4 append. OWRT A-034-LA(2).

Descriptors: *Groundwater, *Water storage, Hydraulics, Water supply, Groundwater recharge, Injection wells, Recharge wells, Artificial recharge, Aquifers, Disposal, Computer programs.
Identifiers: *Saline aquifers, *Underground storage, *Dipping system(Wells).

Previous investigators have established the feasibility of utilizing horizontal saline aquifers for cyclic storage of fresh water and have shown that the recovery efficiency in a dipping system is lower than in a similar horizontal system. The present study was made to determine the effect of dip on the configuration, migration, and recovery of a 'bubble' of injected fresh water in a dipping aquifer of infinite areal extent utilizing a three-dimensionl rectangular miniaquifer. Experimental results showed that the lower surface of the injected bubble would not migrate and would remain radial. However, the upper surface would slide updip for all cases investigated. Dip angles ranged from 5-20 degrees. With increasing dip angle and injected bubble size the velocity of the upper surface increased, although the lower surface neither moved nor grew. For aquifers dipping at 5 degrees or less the velocity of migration of the bubble's upper surface may be approximated by a constant multiplied by the sine of the dip angle. An existing computer program was adapted to describe the three-dimensional case. The results are applicable to miscible displacement processes wherever a density difference exists between native and injected fluids in a dipping aquifer. Subsurface disposal of water-soluble wastes and enhanced recovery operations in the petroleum industry are two such examples outside the field of subsurface storage of fresh water.

EFFECT OF VISCOSITY RATIO ON THE RECOVERY OF FRESH WATER STORED IN SALINE AQUIFERS,
Louisiana State Univ., Baton Rouge. Dept. of Petroleum Engineering.
B. K. Agrawal.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-267 746, Price codes: A05 in paper copy, A01 in microfiche. M.S. Thesis, December 1975. 80 p, 15 fig, 6 tab, 26 ref, 3 append. OWRT(3) A-034-LA.

Descriptors: *Groundwater, *Water storage, Hydraulics, Water supply, Groundwater recharge, Injection wells, Recharge wells, Artificial recharge, Aquifers, *Viscosity, Computer programs.
Identifiers: *Saline aquifers, Underground storage.

Previous studies have shown the technical feasibility of storing fresh water in saline aquifers where the viscosities of injected and native fluids are essentially identical. This study was on the effect of viscosity difference on the extent of mixing between injected and native fluids in two artificially consolidated sandstones of differing thicknesses. When a lower viscosity fluid miscibly displaces a higher velocity fluid, it tends to finger into the higher viscosity fluid region. This causes an irregular boundary and larger interface between the two, with increased mixing. In a cyclic operation of injection/storage/production of a less viscous fluid in a medium containing a more viscous fluid, fingers during injection were found

to retrace themselves during production. During a cyclic process the amount of mixing which occurs may be described in terms of an effective dispersivity which is a function of viscosity ratio. This coefficient may be used in existing computer programs to predict the portion of uncontaminated injected fluid to be later recovered. This recovery efficiency is approximately the same no matter which fluid is the more viscous. The effective dispersivity may be used together with the arithmetic average viscosity to predict the performance of a cyclic process in which the fluids differ in density and viscosity. The results of this study are particularly applicable to the underground storage of heat in the form of hot water.

MINIMIZING COSTS IN WELL FIELD DESIGN IN RELATION TO AQUIFER MODELS,
Arizona Univ., Tucson. Dept. of Hydrology and Water Resources.
C. A. Bostock, E. S. Simpson, and T. G. Roefs.
Water Resources Research, Vol. 13, No. 2, p 420-426, April 1977. 4 fig, 8 ref. OWRT A-024-ARIZ(10).

Descriptors: *Wells, *Costs, *Optimization, *Economic efficiency, Probability, Demand, Pumping, *Aquifers, Annual, Water table, Methodology, Decision making, Seasonal, Groundwater, Mathematical models, Operations research.
Identifiers: *Cost minimization, *Well fields, Probability density function.

For a given production rate from a proposed well field, well construction and replacement costs decrease with fewer and larger wells spaced farther apart, while pumping lift costs increase. A method for minimizing the sum of these two costs is presented which uses a two-dimensional uniform grid of wells to select a combination of well spacing and well capacity that minimizes costs for a given demand. Uncertainty in field permeability at future well sites is treated by averaging the possible outcomes over all wells in accord with a probability density function for permeability values. The method assumes an annual cycle whereby the water table declines owing to pumping in a dry season and is recharged to its initial state during a wet season. It is concluded that the method is suited by Bayesian decision theory application and that it is independent of the mathematical theory for groundwater flow used to predict aquifer response in the aquifer cell model. Identifiers: Saline aquifers, *Dip angle(Aquifers).

The economic and technical feasibility of storing fresh water in a saline aquifer has been studied by numerous investigators. Computational procedures exist for predicting the recovery efficiency in a homogeneous, horizontal, isotropic aquifer of infinite aeral extent. This work studied the migration and recovery efficiency of a stored bubble of fluid in a non-horizontal aquifer. The experiments consisted of injecting a fluid of equal viscosity but greater density than the native fluid into an inclined synthetic sandstone miniaquifer. The fluid was injected, allowed to undergo a period of static storage, and then produced. The instantaneous composition of the produced stream was monitored to determine when the concentration of native fluid reached 3% (breakthrough). During static storage the frontal positions of both the upper and lower traces were recorded. The recovery efficiency was lower in a dipping aquifer than in ahorizontal aquifer. The recovery efficiency became less with greater dip angles and longer static storage times. The larger bottom trace of the injected bubble migrated downdip and its diameter increased during static storage. The velocity of migration of the larger trace could be measured and approximated by an equation, while for most experimental runs the movement of the smaller trace was indeterminate. Results of this study are applicable to fresh water storage or waste disposal as well as other miscible displacements in inclined aquifers.

Identifiers: *Glenwood Springs(Colo), *Low-temperature geothermal sources, Fuel consumption data, Geothermal space heating system design, Heat exchangers, Downhole heat exchangers, Public opinion surveys.

All the technology necessary to use low temperature geothermal sources for heating homes and buildings now exists, has been put into use in various places throughout the world, and is dependent basically only on economic and political decisions for its application in areas where thermal water is present. This report contains results of the first phase of an engineering/economic feasibility study for use of low temperature geothermal sources at Glenwood Springs, Colorado. Conversion costs of building systems, transport distance of geothermal water, and quality of the water still require further study, but it can be concluded that geothermal heat could be delivered to the area for $2 to $5 per million BTU, a price competitive with that of natural gas heating should the latter continue to escalate. It would be considerably less expensive than solar conversion at present. Besides providing a historical overview of low temperature geothermal resource development worldwide, the report raises legal and political issues pertinent to new, widespread use of geothermal water, discusses implicatons for public policy and population dynamics, and lists potential engineering problems such as scaling, corrosion and general system maintenance. 100 MESH SAND IMPROVES HYDRAULIC FRAC RESULTS.
World Oil, Vol. 184, No. 6, p 44 May, 1977. 1 ref.

Descriptors: *Fractures(Geology), *Water wells, *Water yield improvement, Specific capacity, Rehabilitation, Sands, Oil wells, Carbonate rocks.
Identifiers: *Hydraulic fracturing.

While drilling operators for some time have been using small diameter, 100 mesh sand as a method of controlling fluid loss in high volume acid or hydraulic fracturing treatments of wells, principal benefits and application procedures are not very widely known. Penetrating of acid and fracturing jobs in carbonates often falls short of expectations due to hairline fractures in the formation which steal the working fluid and limit the extension of the main fracture from the well bore. Once the 100 mesh sand is introduced, however, normal fluid loss additives are able to bridge the sand pack in the hairline fracture and the desired effects are obtained. The sand which remains in the fractures at the completion of the treatment forms a highly permeable channel for ground water and helps to prevent fractures from closing naturally. (Eberle-NWWA)

IEEE Transactions on Nuclear Science, Vol. NS-24, No. 1, p 29-32, February, 1977. 2 ref.

Descriptors: *Thermal power, *Government supports, *Research and development, Federal project policy, Project planning, Cost sharing, *Geothermal studies, Electric power production.
Identifiers: Resource exploration and assessment, Engineering research, *Geothermal program(ERDA).

In order to help provide viable options to exploit America's geothermal resouces, ERDA is taking a lead in research and development by investigating ways to assess existing geothermal reservoirs and their energy potential, encouraging the present geothermal industry to continue development, and directly assisting in devising new technologies for utilizing more inaccessible sources. Besides the geological and technological impediments to rapid geothermal resource development, legal and regulatory problems related to geothermal mining need to be worked out, and utility companies must be convinced to take moderate risks in implementing new procedures. ERDA hopes to discover solutions by concentrating its geothermal program on four major areas: (1) a loan guaranty program, (2) construction and operation of pilot plants, cost-shared with industry in most cases, (3) monies for advanced technology research, and (4) support for environmental and institutional studies. A new form of solicitation known as a Program Research and Development Announcement has led to the negotiation of a good many new contracts with the

ERDA Geothermal Division. A new and more generous agency patent policy is also expected to facilitate cooperation between ERDA and the private sector. (Eberle-NWWA)

DEEP WELLS FOR DEWATERING OFFER REAL ADVANTAGES, PART II,
Johnson Driller's Journal, Vol. 49, No. 2, p 1-3, March-April, 1977, 6 fig, 3 ref.

Descriptors: *Dewatering, *Deep wells, *Excavation, Water table, Pumping, Well screens, Observation wells, Foundations, Minnesota, Georgia.
Identifiers: Prairie Island Nuclear Plant(Minnesota), Fort Gaines Dam(Georgia).

Because of the design of dewatering wells is such that maximum drawdown with minimum yield are realized, design considerations such as pump placement must reflect this intent. Also, it should be noted that because of special atmospheric and head conditions in dewatering situations, observation wells cannot be reliably used to determine the actual water level in the aquifer. Two specific cases serve as examples of creative, efficient use of deep wells for dewatering. The Prairie Island Nuclear Plant near Red Wing, Minnesota was constructed over a thick water-table aquifer composed of alluvial sand and gravel; excavation specifications called for dewatering to 32 feet below static level. A total of 39 deep wells completed by natural development lowered the water levels to the desired elevation 20 days ahead of schedule. In a similar manner 24 deep wells dewatered a limestone aquifer and controlled artesian head to permit construction of the spillway of the Ft. Gaines, Georgia dam. (See also W77-07294) (Eberle-NWWA)

A PRELIMINARY ANALYSIS OF THE ENERGY AND WATER REQUIREMENTS FOR DEVELOPING GEOTHERMAL ENERGY IN ARIZONA,
Arizona Univ., Tucson. Dept. of Geosciences.
D. Norton, and T. Gerlach.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-268 047, Price codes: A02 in paper copy, A01 in microfiche. In: Proceedings, Conference on Water Requirements for Lower Colorado River Basin Energy Needs, The University of Arizona, Tucson, Arizona, May 8-9, 1975. p 107-121, 4 fig, 1 tab, 3 ref. OWRT A-054-ARIZ(1). 14-31-0001-5003.

Descriptors: *Geothermal studies, *Thermal water, Heat flow, Hydrologic data, *Energy, *Water requirements, *Arizona.

Production of energy from geothermal fluids is an attractive alternative for many reasons. Geothermal energy, unlike most other energy alternatives, does not require extensive mining, refinement, packaging, transportation, or surface storage of fuel. Major quantities of energy and water input are required to develop energy resources. If the energy inputs are based on current technology, fossil fuels are implicitly required for a large percentage of this input. Geothermal energy based power systems have two distinct advantages: (1) Resource development and delivery to the plant site consume small amounts of energy and (2) the recovery of the resource has a minor impact on man's environment. The estimated overall energy efficiency of a 2000MW geothermal power system in Arizona is approximately 20-50% (to produce 2000MW, approximately 1200MW must be consumed). This means that 80-50% of the total energy recovered from a geothermal system is required for exploration, development, power plant construction, and environmental protection. A 2000MW geothermal energy development would require at least 250 exploration wells drilled to a depth of 1.5 kilometers plus 300 wells drilled to a similar depth for actual development and recovery of subsurface thermal water. Only a similar depth for actual development and recovery of subsurface thermal water. Only 150 of the 300 wells would be producers--the remainder could be used for recharge. The energy consumed in this operation relates directly to drilling equipment and materials. This work requires fossil fuel type energy support under today's technology. The total energy requirement for both phases is 5 x 10 to the thirteenth power kcal, equivalent to 3.4 x 10 to the seventh power BBLS of crude oil. (See also W76-04005)

Identifiers: *Groundwater resources(Guam), *Guam.

A historical account of the development of Guam's groundwater resources is given. Guam's hydrogeology is discussed and groundwater areas are indicated, distinctions being made between basal water areas, para-basal water areas, and perched water areas. Based on available data, a study is made of the geochemistry of Guam's groundwater resources. The groundwater pollution potential of different methods of surface and subsurface disposal of waste and storm water is discusses. Of special significance are calculations of the sustainable yield of the basal lens of northern Guam along with recommendations for further development of groundwater resources. Finally, recommendations are made concerning desirable locations for monitoring wells. (Winter - Guam)

Identifiers: *Memphis area(Tenn), Groundwater management.

Annual pumpage in the Memphis, Tennessee area, for both the Memphis Sand ('500-foot' sand) and Fort Pillow Sand ('1400-foot' sand) from the time of initial pumping from these aquifers to 1975 is presented in both tabular and graphic forms. The Memphis Sand supplied 188 million gallons per day in 1975 or 95 percent of the total water used in the area. Pumpage from the Fort Pillow Sand has decreased in recent years and in 1975 was about 4 million gallons per day. Pumping increases from the Memphis Sand have caused an almost continual decline of water levels. Water-level-change may show the fluctuations in water levels for two periods of high water use. Water levels in the Fort Pillow Sand show a rise since 1963, coincidental with pumping reductions. The data suggest that a constant pumping rate will cause little water-level decline and that the water levels can be altered for efficient resource management by areally varying the distribution of pumping. Identifiers: *Snake Plain aquifer(Idaho).

The users of water from the springs that discharge from the Snake Plain aquifer in Gooding and Jerome Counties, Idaho, are concerned about the potential effects that increased pumpage and changing irrigation practices may have on spring discharge. Before development of irrigated land on the Snake River Plain, the springs between Kimberly and King Hill contributed an estimated 4,200 cubic feet per second to the flow in Snake River. As agricultural lands were developed, increasing amounts of irrigation-return flow caused an increase in spring discharge. In 1966, the total spring flow exceeded 6,000 cubic feet per second. Now, increasing amounts of pumpage may reverse the trend. Using power-consumption data, 1973 pumpage for irrigation in southern Gooding and western Jerome Counties was estimated to be nearly 85,000 acre-feet. A hydrologic model was constructed to evaluate the effects of various management schemes on discharge from the springs. A constant-head boundary was simulated at the east edge of the study area to facilitate future interface with larger scale models of the entire Snake Plain aquifer. The springs, modeled as head-dependent flow, respond to stress placed on the system. Output from the model includes a map showing water-level decline and a table of computed discharges for the 12 major springs. (Woodard-USGS)

This report summarizes information concerning many aspects of the geology and hydrology at Memphis, Tenn. It also outlines some of the current problems related to the local geology and hydrology or ones that may arise as a result of urbanization and industrialization of the area. The city is in the Coastal Plain physiographic province and is underlain at shallow depths by sand, clay, silt, gravel, and lignite. These post-Midway strata (Wilcox and younger) make up geologic units belonging to the uppermost Paleocene, Eocene, and Pliocene ( ) Series of the Tertiary System and to the Pleistocene and Holocene Series of the Quaternary System. Environmental problems of immediate or future concern are associated with six general topics: (1) aggregate resources, (2) foundation materials, (3) earthquake hazards, (4) flood hazards, (5) water resources, and (6) solid waste disposal. Consideration of these topics provide an overall insight into the close interrelation of the problems and the need for coordinated studies of the geology and hydrology at Memphis. (Woodard-USGS)

SEDIMENT YIELD AND LAND USE IN SOUTHWEST UNITED STATES,
Geological Survey, Lakewood, Colo. Water Resources Div.
R. F. Hadley.
In: Effects of Man on the Interface of the Hydrological Cycle with the Physical Environment; Proceedings of Paris Symposium, September 1974. International Association of Hydrological Sciences Publication No 113, p 96-98, 1974. 2 tab, 4 ref.

Descriptors: *Sediment yield, *Land use, *Southwest U.S., *Colorado River basin, *Erosion control, Evaluation, Semiarid climates, Livestock, Range grasses.

Comparison of the sediment discharge records at the Grand Canyon gaging station (Lees Ferry, Arizona) on the Colorado River for the two periods, 1926-1941 and 1942-1960 show that the suspended-sediment loads for the latter period are only 50 per cent of the earlier period. These data combined with studies of erosion on the Colorado Plateau rangelands indicate that changes in land use probably are responsible for much of the reduction in the sediment yield. Livestock numbers have been greatly reduced on the arid and semiarid rangelands in the past 20 years and erosion control practices have been initiated in many critically eroding areas. Experimental studies by the Geological Survey indicate that grazing control alone can reduce runoff by as much as 30 per cent and sediment yield by 40 per cent. (Woodard-USGS)

5A. Identification Of Pollutants

FULVIC ACID-METAL ION INTERACTIONS IN WATER,
New Hampshire Univ., Durham. Dept. of Chemistry.
J. H. Weber, and S. A. Wilson.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-267 597, Price codes: A04 in paper copy, A01 in microfiche. New Hampshire Water Resources Research Center, Durham, Completion Report, Research

Report No. 14, (1977). 45 p, 12 tab, 40 ref. OWRT A-035hNH (2). 14-31-0001-3829.

Descriptors: *Acids, Acidic soils, *Fulvic acids, *Humic acids, *New Hampshire, Soil chemistry, *Soil analysis, *Podzols, Analytical techniques, Spectrophotometry, Volumetric analysis, *Pollutant identification, Chemical analysis.
Identifiers: Para-benzosemiquinone, *Electron spin resonance, Oyster River(NH), Metal ions.

This report emphasized the further characterization of fulvic and humic acids isolated from the B2 horizon of a Podzol soil obtained at Conway, N. H. and isolated from the Oyster River (Lee, N. H.). The authors measured the E4/E6 ratios (absorbance ratio at 465 nm/665 nm) and the absorptivities of all the humic material samples. The authors also describe the cryoscopic determination of the dissociation-corrected number-average molecular weights Mn(corr) of the soil and aquatic fulvic acid samples. The corrections for dissociation of fulvic acid were determined by a theory which utilizes the equivalents per gram and the acid dissociation constants of the fulvic acid samples. The soil and aquatic fulvic acid Mn(corr) values are 644 and 626, respectively. The authors analyzed the solid state and aqueous solution electron spin resonances (esr) spectra of the aquatic and soil fulvic and humic acids. Because the aqueous solution esr spectra mimic the behavior of the model compound para-benzosemiquinone, it was concluded that semiquionone free radicals predominate in fulvic acid. In addition, a decrease in spin concentration at a potential of 0.20 volts (vs. SCE) demonstrates that the semiquinone radicals are at least partially responsible for the reducing capability of humic materials. From the above results, a quantitative semi-quinone analysis for humic materials was devised.

THE UTILITY OF PALEOLIMNOLOGICAL ANALYSES OF LAKE SEDIMENTS FOR EVALUATING ACID PRECIPITATION EFFECTS ON DILUTE LAKES,
Cornell Univ., Ithaca, N.Y. Dept. of Natural Resources.
C. L. Schofield, and J. N. Galloway.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-267 595, Price codes: A03 in paper copy, A01 in microfiche. Center for Environmental Research, Cornell University, Ithaca, New York. Completion Report, May 1977. 23 p, 16 fig, 3 tab, 21 ref. OWRT A-071-NY(1). 14-34-0001-7067.

Descriptors: *Paleolimnology, *Diatoms, Sediments, Lakes, *Lake sediments, Hydrogen ion concentration, Bioindicator, Pollutant identification, Acids, Ions, Precipitation(Atmospheric).
Identifiers: *Acid precipitation, Microfossils, Dilute lakes.

Sediment cores were collected from three Adirondack Mountain lakes exhibiting a wide range in pH (Honnedaga Lake, pH 4.7; Woodhull Lake, pH 5.2; Seventh Lake, pH 6.5) in July, 1975. Diatom microfossils present in the cores were categorized in terms of pH preference and an index (alpha) based on the ratio of acidophilous to alkaliphilous units was determined. The regression of index (alpha) for surficial sediments on lake pH (pH = 6.63 - .81 log alpha) was utilized to estimate lake pH for historical sediment layers. Honnedaga Lake exhibited a marked increase in acidophilous taxa in the uppermost cm. of sediment and a decrease in estimated pH from 5.5-6.0 for historical sediments to pH 5.0 for recent sediments. The other lakes showed no significant change in index alpha and estimated pH. The known history of recent acidification in Honnedaga Lake suggests that pH indices based on diatom microfossils may be sensitive indicators of lake acidification.

Michigan State University Institute of Water Research, Technical report No. 8, September 1969. 91 p, 19 fig, 7 tab, 38 ref. M.S. Thesis. OWRT A-023-MICH(2). 14-01-0001-1482, FWPCA Training Grant 5T1-WP-109.

Descriptors: *Michigan, *Chemical properties, *Physical properties, *Monitoring, *Instrumentation, Water properties, Data collections, Dissolved oxygen, Temperature, Automation, Conductivity, Alkalinity, Turbidity, Sediments, Seasonal, Hydrogen ion concentration, Phosphorus, Chlorides, Analytical techniques, Dissolved oxygen analyzers, Water temperature, Diurnal, On-site invetigations.
Identifiers: *Automated monitoring, *Red Cedar River(Mich), *Continuous monitoring, Benthoplankton concentration, Sediment scouring, Warm-water stream, Continuous automated monitor, Specific conductance, Total phosphorus, Autotroph.

A continuous automated monitor on the Red Cedar River at East Lansing, Michigan, was operated from August, 1967, to August, 1968. Dissolved oxygen, water temperature, specific conductance, and pH were measured. In addition, total alkalinity, total phosphorus concentration, chloride and benthoplankton concentration were spot checked. Seasonal patterns and possible interrelationships of the various parameters were sought. The alkalinity and pH determinations indicated the river was highly buffered. Specific conductance measurements revealed the existence of drain discharges resulting in pronounced conductance peaks. Dissolved oxygen levels fell dangerously low only during the months of August and September. A change in the diurnal character of oxygen levels was noted after removal of macrophytes from the stream due to scouring during intense runoff. Total phosphorus concentration increased initially during a flood, then decreased because of dilution. The concentration again increased as the discharge started to decrease. Dissolved oxygen concentration was inversely related to total phosphorus concentration. The roles of turbidity and sediment scouring have a definite effect upon autotroph production as evidenced by the increased load of detached chlorophyll-bearing material after intense runoff. (Henley-ISWS)

DETERMINATION OF PYRIDINE IN FARM CROPS AND FISH, (IN RUSSIAN),
Kiev Inst. of Nutritional Hygiene (USSR).
L. R. Polishchuk, and L. A. Stempkovskaya.
Gig Sanit. 2, p 69-70, 1974.

Descriptors: *Pollutant identification, *Analytical techniques, Agriculture, Fish, *Methodology, Crops, *Potatoes, Water pollution.
Identifiers: *Pyridine.

A method of determining pyridine (an environmental pollutant) in agricultural crops and fish based on the reaction with barbituric acid and the conditions for its quantitative extraction from the investigated objects and the preparation of extracts free from admixtures interfering with the determination were developed. Two methods are described, 1 for all products and the other for all products except potatoes. The determination error does not exceed +10%, sensitivity is 0.2 mg/kg and the time required for 3 parallel determinations is 1 1/2-2h.--Copyright 1975, Biological Abstracts, Inc.

Identifiers: Bacteriocins, *Enterococci, Streptococcus-Faecalis, Streptococcus-Faecium.

Examination of enterococci isolated from urine of patients with urogenital infections revealed only Streptococcus faecalis strains. Only S. faecium strains were isolated from water samples. Both groups were equally represented among food isolates. There was a complete correlation between the phage sensitivity and the enterocinogenity of the enterococci isolated from urine. Both characteristics probably are important as epidemiological markers for the pathogenicity of the enterococci.--Copyright 1975, Biological Abstracts, Inc.

A STATISTICAL ANALYSIS OF THE MERCURY CONCENTRATIONS IN FISH FROM LAKE JOCASSEE, SOUTH CAROLINA,
Clemson Univ., S.C. Dept. of Environmental Systems Engineering.
H. D. Lienert, and W. C. Rowell.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-267 670, Price codes: A04 in paper copy, A01 in microfiche. December 1976. 54p, 11 fig., 8 tab., 12 ref., 3 append. OWRT A-032-SC(2).

Descriptors: *Mercury, *Reservoirs, *Bass, Trout, Statistical methods, *South Carolina, *Brown trout, Lakes, Pollutant identification, Lethal limit, Water quality standards, Absorption.
Identifiers: *Lake Jocassee(SC).

Mercury concentration in the axial muscle of fish from Lake Jocassee was determined. The predominant species tested were Largemouth Bass and Brown Trout. Models were built at the ninety-five percent confidence level with respect to lake, species, and year of collection. Statistical techniques were used to discriminate between models to determine if a trend was present. It was determined that there was a definite need for more fish samples and some modifications in data collection. It was also determined that sampling should be limited to actively growing individuals rather than to older fish which are growing in weight more than in length. The concentration of mercury were higher than the Federal Food and Drug Administration's 0.5 ppm recommended allowance.
W77-08190

ARSENIC IN WATER AND FISH FROM LAKES HARTWELL, KEOWEE, AND JOCASSEE, SOUTH CAROLINA,
Clemson Univ., S.C. Dept. of Environmental Systems Engineering.
J. M. Harden.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-267 671, Price codes: A03 in paper copy, A01 in microfiche. August 1976. 31 p, 6 tab, 40 ref, append. OWRT A-032-SC(1).

Descriptors: *Arsenic, Fish, Reservoirs, *South Carolina, Lethal limit, Water quality standards, *Pollutant identification, Lakes, Water pollution, Absorption.
Identifiers: Lake Hartwell(SC), Lake Keowee(SC), Lake Jocassee(SC).

Arsenic concentrations in fish and water samples from Lakes Hartwell, Keowee, and Jocassee were determined. All concentrations in fish were below FDA recommended limits, and all concentrations in water were below USPHS Drinking Water Standards. One possible trend was observed, i.e., arsenic concentrations in fish followed the order Jocassee > Hartwell > Keowee. No other trends were apparent.
W77-08191

A SURVEY OF CADMIUM OCCURRENCE AND CONCENTRATION IN FISH FROM ELEVEN MAJOR RESERVOIRS IN SOUTH CAROLINA,
Clemson Univ., S.C. Dept. of Environmental Systems Engineering.
M. H. Davis.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-267 668, Price codes: A03 in paper copy, A01 in microfiche. December 1976. 33 p, 1 fig, 11 tab, 55 ref, append. OWRT A-032-SC(3).

Descriptors: *Cadmium, *Heavy metals, Fish, *Reservoirs, South Carolina, *Pollutant identification, Absorption, Surveys.

A total of 136 fish were collected from 11 South Carolina reservoirs and analyzed for the concentration of accumulated cadmium. All samples contained less than 5 micro-g cadmium per gram of tissue with a mean value of 0.138 micro-g/g.

SORPTION AND FLOW OF CARBON DIOXIDE AND SOME HYDROCARBONS IN A MICROPOROUS CARBON MEMBRANE,
Imperial Coll. of Science and Technology, London (England). Dept. of Chemistry.
R. Ash, R. M. Barrer, and P. Sharma.
Journal of Membrane Science, Vol. 1, No. 1, p 17-32, March 1976. 7 fig, 5 tab, 20 ref.

Descriptors: *Membrane processes, *Membranes, Flow, *Laboratory tests, Gases, Carbon dioxide, Helium, Diffusion, Permeability, Sorption, Isotherms, Analytical techniques, Mathematical models, Analysis, Organic compounds.
Identifiers: Carbolac carbon membranes.

The flow of He, CO2, CH4, C2H6, C3H8, n-C4H10, and neo-C5H12 was investigated using microporous carbon membranes. Physical constraint of the compacted carbon with steel plungers in a steel membrane holder substantially altered sorption equilibria and hysteresis loops in the multilayer and capillary condensation region as compared with unconstrained powder, but made little difference in the region below monolayer coverage. Capillary pressure differences between contrained compact and unconstrained powder showed maxima in the vicinity of monolayer coverage and near coverages where differential diffusion coefficients also went through maxima, which supports a hydrodynamic mechanism for sorbed fluids as monolayer coverage was approached and exceeded. For these larger uptakes, flow rates were dominated by contributions arising from the presence of sorbed films with concentration gradients. Permeabilities did not show maxima found with differential diffusion coefficients. Blockage by sorbed films of the gas phase transport of helium was investigated for hydrocarbons using helium as internal indicator. Blockage became nearly complete as sorption approached monolayer coverage. (Humphreys-ISWS)

NITROGEN AND PHOSPHORUS ANALYSES OF RAINFALL AT ROTORUA, NEW ZEALAND,
Marine Dept., Rotorua (New Zealand). Fisheries Research Div.
G. R. Fish.
Journal of Hydrology (New Zealand), Vol. 15, No. 1, p 17-26, 1976. 1 fig, 6 tab, 10 ref, 1 append.

Descriptors: *Nitrogen, *Phosphorus, *Nitrogen compounds, *Phosphorus compounds, *Rainfall, Water quality, Analytical techniques, Nitrites, Ammonia, Nitrates, Nutrients, Phosphates, Water pollution sources, Precipitation(Atmospheric), Meteorology, Chemical analysis, *Pollutant identification, Path of pollutants.
Identifiers: *Lake Rotorua(New Zealand), *Rotorua(New Zealand), Rainstorms, Rainwater quality.

Analyses of the dissolved inorganic nitrogen and phosphorus content of rainfall at Ngapuna, Rotorua, were made between 21 July 1972 and 19 March 1974. Dry fallout was excluded from the water samples by exposing collectors only when rain was falling or was imminent. The total rainfall sampled was 341 mm, and its mean solute concentration expressed in g/ha.mm (=g/cu m x 10) was 0.057 P04-P, 0.842 NH4-N and 0.215 N03-N. The mean solute concentration of 34 rainstorms (in g/ha.mm) was 0.08 P04-P, 1.83 NH4-N and 0.43 N03-N. No seasonal changes in solute concentrations were discovered. Synoptic samples collected in open country (e.g., Tongariro National Park) were similar in composition to those from Ngapuna, Rotorua, but samples collected at city sites (e.g., Christchurch) contained more phosphate. (Henley-ISWS)
W77-08242

THE FALLOUT OF NITROGEN AND PHOSPHORUS COMPOUNDS FROM THE ATMOSPHERE AT NGAPUNA, NEAR ROTORUA, NEW ZEALAND,
Marine Dept., Rotorua (New Zealand). Fisheries Research Div.
G. R. Fish.
Journal of Hydrology (New Zealand), Vol. 15, No. 1, p 27-34, 1976. 2 fig, 2 tab, 8 ref.

Descriptors: *Fallout, *Nitrogen, *Nitrogen compounds, *Phosphorus, *Phosphorus compounds, Analytical techniques, Ammonia, Nitrates, Nutrients, Phosphates, Water pollution sources, Meteorology, Chemical analysis, Fertilization, Eutrophication.

Identifiers: *Nitrogen compounds, *Lake Rotorua(New Zealand), *Rotorua(New Zealand).

A total of 183 samples of atmospheric fallout, usually collected over periods of 24 hours (never longer than 3 days) between April 1974 and April 1975, was analyzed for N and P content. Local bush fires and pollen-fall caused some changes in fallout quality, but seasonal effects generally were slight. Dry fallout contributed 0.37 g/ha.day P04-P and 0.77 g/ha.day total P (36 and 54% of the deposition on raindays), while the nitrogen contribution was 1.03 g/ha.day NH4-N and 0.24 g/ha.day N03-N (10 and 7% of the rainday deposition). The data were compared to those collected previously on rainfall only. The data were used to improve the estimate of the atmospheric contribution to the nutrient budget of Lake Rotorua. (Henley-ISWS)

CHELATING AGENT ANALYSIS BY HIGH SPEED LIQUID CHROMATOGRAPHY,
Missouri Univ., Columbia. Dept. of Chemistry.
D. R. Jones, IV.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-267 918, Price codes: A09 in paper copy, A01 in microfiche. Ph.D. thesis, July, 1976. 176 p, 20 fig, 12 tab, 127 ref. OWRT B-095-MO(5), 14-31-0001-4099.

Descriptors: *Chelation, *Pollutant identification, Chromatography, *Heavy metals, Copper, Methodology, Analytical techniques, Path of pollutants, Spectrophotometry, Monitoring, Sewage effluents, Nitrilotriacetic acid, *Waste water treatment.
Identifiers: Metal plating wastes, Organometallics, EDTA, *Chelating agents, Atomic absorption, Spectrophotometry.

Chelating agents are important species in the transport and reactions of heavy metals in water. Methods for their analysis are needed. Described are methods of analysis for chelating agents based primarily on the separation of copper chelates by high speed liquid chromatography followed by monitoring of the copper-containing effluents by atomic absorption spectrophotometry. Details of the interface between the high speed liquid chromatograph and the atomic absorption spectrophotometer are described. Operating parameters for the chromatograph to make it compatible with atomic absorption are detailed. Separation and analysis conditions are given. The technique as applied to sewage effluents is discussed.
W77-08286

DETECTION OF PHOSPHATE ADSORPTION ONTO COAL HUMIC ACIDS,
Missouri Univ.-Columbia. Dept. of Chemistry.
L. O. Isselhardt.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-267 998, Price codes: A06 in paper copy, A01 in microfiche. M.A. Thesis, December 1975. 106 p, 14 fig, 13 tab, 58 ref. OWRT B-110-MO(2), 14-31-0001-4170.

Descriptors: Coal, *Humic acids, *Phosphates, Adsorption, *Coal mine wastes, *Pollutant identification, Phosphorus, Waste water treatment, Water reuse, Pollution abatement, Absorption, Separation techniques.
Identifiers: Adsorption isotherms, Iron humate.

Because of their acid-base, sorption, and chelation properties, coal humic acids have some potential applications in treating some of the pollutants arising from the mining, combustion, and conversion of coal and from stack gas scrubber effluents. This thesis is part of a research program designed to determine the interaction of coal humic acids with a variety of species found in wastewaters. The uptake of orthophosphates and polyphosphates by solid coal humic acids was examined. The preparation and purification of coal humic acids and iron humates are described. Details are given for the difficult analysis of phosphates in the presence of humic substances. It was found that coal humic acids adsorb phosphates very poorly. Since these materials effectively remove heavy metal ions from water the possibility is raised of selectively removing dangerous heavy metal ions while leaving nutrient phosphate in the water for fertilizer in water used for land reclamation or crop irrigation.
W77-08294

DEVELOPMENT OF A COLUMN CHROMATOGRAPHY METHOD FOR FIELD OF PRECONCENTRATION OF TRACE METALS WITH APPLICATION TO THE HAW-CAPE FEAR RIVERS, N.C.,
North Carolina Univ. at Chapel Hill. Dept. of Environmental Sciences and Engineering.
J. H. Dempsey.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-267 878, Price codes: A05 in paper copy, A01 in microfiche. M.S. Degree in Public Health, 1976. 74 p, 8 tab, 6 fig, 46 ref. OWRT A-073-NC(1), 14-31-0001-5033.

Descriptors: *Chromatography, *Trace elements, *Metals, *Heavy metals, Ion exchange, Adsorption, Cadmium, Chromium, Copper, Mercury, Zinc, Rivers, North Carolina, Pollutant identification, Resins, Analytical techniques, Methodology, Water pollution sources.
Identifiers: *Trace metals, Dissolved trace metals, Ion exchange column, Resins, Haw River(NC), Cape Fear River(NC).

Column chromatography was investigated for adaptation as a field technique for concentrating dissolved trace metals from natural waters. Manganese oxide impregnated acrylic fibers, a chelating resin (Chelex 100), a cation exchange resin (AG-50W) and an anion exchange resin (AG-1) were employed in preliminary work. Ion exchange resins were the most satisfactory and the final design for field use consisted of a cation and an anion exchange column in series. Natural water spiked with CR51 as a tracer indicated that soluble Cr(III) and Cr(VI) could be separated by the technique. A portable field unit was constructed and used to carry out a one year survey of Cd, Cr, Cu, Pb, and Zn in the Haw-Cape Fear Rivers of North Carolina. Elevated concentrations of Cr, Cu, and Cd were observed in the upper industralized areas while Zn and Pb appeared to have sources throughout the basin. Concentration ranges in microgram/l were <0.10-1.22 Cd, <0.1-26.8 Cr, 0.0-9.1 Cu, 1.1-74.0 Pb and 2.9-74.0 Zn. (Stewart-NC State)

CHROMOSOME MUTATIONS IN A FERN POPULATION GROWING IN A POLLUTED ENVIRONMENT: A BIOASSAY FOR MUTAGENS IN AQUATIC ENVIRONMENTS,
Massachusetts Univ., Amherst. Dept. of Botany.
E. J. Klekowski, and B. B. Berger.
American Journal of Botany, Vol. 63, No. 2, p. 239-246, February 1976. 16 fig, 3 tab, 3 ref. OWRT A-063-MASS(2), 14-31-0001-5021.

Descriptors: *Bioassay, *Massachusetts, Water pollution effects, *Ferns, Industrial wastes, Pollutant identification, Cytological studies, Spores, Aquatic plants.
Identifiers: *Chromosome mutations, *Osmunda regalis, *Millers River(Mass).

A population of royal ferns, Osmunda regalis, which is periodically submersed by the waters of the Millers River was found to have a very high frequency of chromosome mutations. The Millers River is located in western Massachusetts and is heavily polluted with industrial wastes. Approximately 43% of meiotic samples collected in 1973 from the Millers River population were heterozygous for mutations such as paracentric inversions or reciprocal translocations, whereas less than 1% of meiotic samples from nearly non-polluted control populations were such heterozygotes. Cytological analysis within royal fern clones indicates that practically all of the chromosome mutations were post-Zygotically induced and that at least 64% were induced since 1969. Over 26,000 spore mother cells were analyzed for chromosome aberrations.

PYRO- AND TRIPOLY-PHOSPHATE CONTENTS OF SEDIMENTS,
Missouri Univ.-Columbia. Dept. of Agronomy.
R. W. Blanchar, and D. C. Riego.
Water, Air and Soil Pollution, Vol. 7, p 27-31, 1977. 1 fig, 2 tab, 6 ref. OWRT A-059-MO(3), USDI-OWRR-14-31-0001-3825.

Descriptors: *Phosphates, Phosphorus, *Sediments, *Pollutant identification, Methodology, Analytical techniques, Chromatography, Anion exchange.
Identifiers: *Polyphosphates, *Pyrophosphates, *Sediment analysis.

A method to determine pyrophosphate (PP) and tripolyphosphate (TPP) in sediments was developed. Sediment was extracted with 2% EDTA + 0.1 M NH4F followed by a second extract of 2% EDTA + 1N NaOH. Orthophosphate (OP), PP, and TPP were separated by anion exchange chromatography, the fractions collected, and P determined after extraction into isobutanol. The limit of detection of the method was 0.5 micro-g P g-1 sediment. Fourteen sediments were tested and the highest TPP found was 1.8 micro-g P g-1 sediment. Thirteen of the sediment samples contained less than 1 micro-g P g-1 as TPP. Only three of the 14 samples contained more than 1 micro-g P g-1 as PP. The highest level of PP (8.5 micro-g P g-1) was found in sediment from an animal waste lagoon. The error for samples containing 36.9 micro-g P g-1 as PP was plus or minus 7.6, and for TPP at 12.3 micro-g P g-1 the error was plus or minus 3.3. The values for PP and TPP were underestimated by 6 and 36%, respectively.

APPLICATION OF EREP, LANDSAT AND AIRCRAFT IMAGE DATA TO ENVIRONMENTAL PROBLEMS RELATED TO COAL MINING,
Earth Satellite Corp. Washington, D. C.
R. V. Amato, O. R. Russell, K. R. Martin, and C. E. Wier.
In: Proceedings of the NASA Earth Resources Survey Symposium, June 1975, Technical Session Presentations, Agriculture-Environment, Volume I-A. Report No. NASA TM X-58168. Symposium held June 9-12, 1975, Houston, Texas, p 309-327, September 1975. 8 fig, 2 tab, 7 ref.

Descriptors: *Coal mines, *Kentucky, *Indiana, *Remote sensing, *Environment, Land use, Strip mines, Mapping, Monitoring, Spoil banks, Mining, Water pollution sources, Surveys, Coal mine wastes, Land management, Land reclamation, Satellites(Artificial), Aerial photography, Evaluation, Topography.
Identifiers: LANDSAT, Skylab.

The synoptic and repetitive views of aerial remote sensing records offer valuable environmental and dynamic change data in areas of both surface and underground coal mining. Depending upon the accuracy of requirements, these data are available through both low and high level aircraft surveys as well as LANDSAT and EREP (SKYLAB) imagery. Remote sensors can provide timely and accurate information on surface mining status and reclamation progress, coal mine refuse piles and slurry ponds, acid water and silation problems, and various aspects of environmental impact. Remote sensing techniques were used to study coal mining sites within the Eastern Interior Coal Basin (Indiana, Illinois, and western Kentucky), the Appalachian Coal Basin (Ohio, West Virginia, and Pennsylvania), and the anthracite coal basins of northeastern Pennsylvania. Airborne sensors included multispectral scanners, multiband cameras, and standard mapping cameras loaded with panchromatic, color, and color infrared films. The research that was conducted in these areas is a useful prerequisite to the development of an operational monitoring system that can be employed periodically to supply state and federal regulatory agencies with supportive data. Further research, however, must be undertaken to systematically examine those mining processes and features that can be monitored cost effectively using remote sensors and for determining what combination of sensors and ground sampling processes provide the optimum combination for an operational system. POSSIBILITIES AND ROLE OF BIOLOGICAL ANALYSIS IN EVALUATING THE DEGREE OF POLLUTION OF WATER BODIES, (IN RUSSIAN),
Akademiya Nauk SSSR, Leningrad. Zoologicheskii Institut.
A. V. Makrushin.
Gidrobiol Zh. 10(2), p 98-104, 1974.

Descriptors: *Bioindicators, *Bioassay, *Industrial wastes, Toxicity, *Pollutant identification, *Bacteriology, Analytical techniques, Potable water, Water quality standards.

Using biological analysis (indicator organisms), it is possible to detect one-time or continuous pollution. The biological method permits finding the source of pollution by moving upstream. The source is found by chemical and bacteriological methods only if pollution is constant. Biological analysis is cheaper and faster than bacteriological and chemical analysis. Using the biological method, pollution by industrial wastes can be detected where it cannot be found by other methods. The existing variants of biological analysis need improvement, but because of the high sensitivity of aquatic organisms to the prolonged effect of small concentrations of toxic substances the composition of aquatic biocenoses is the best criterion of the fitness of water for human consumption.--Copyright (c) 1975, Biological Abstracts, Inc.

QUANTITATIVE WATER QUALITY WITH LANDSAT AND SKYLAB.
Kansas Univ., Lawrence.
H. L. Yarger, and J. R. McCauley.
In: Proceedings of the NASA Earth Resources Survey Symposium, June 1975, Technical Session Presentations, Agriculture-Environment, Volume I-A. Report No. NASA TM X-58168. Symposium held June 9-12, 1975, Houston, Texas, p 347-370, September 1975. 21 fig, 2 tab, 16 ref.

Descriptors: *Water quality, *Remote sensing, *Kansas, *Surface waters, Reservoirs, Water temperature, Dissolved solids, Suspended solids, Secchi disks, Phosphates, Potassium, Nitrates, Analysis, Monitoring, Satellites(Artificial), Chlorophyll, Measurement.
Identifiers: LANDSAT, Skylab.

LANDSAT Multispectral Scanner (MSS) reflectance levels are useful for quantitative measurement of suspended solids up to at least 900 ppm. MSS band ratios derived from computer-compatible tape (CCT) can measure suspended solids with 67% confidence level accuracy of 12 ppm over the range 0-80 ppm, and 35 ppm over the range 0-900 ppm. Suspended solids contour maps can be easily constructed from CCT's for water bodies larger than approximately 100 acres. Rationing suppresses MSS reflectance level dependence on seasonal sun angle variation and permits measurement of suspended load the year round in the middle latitudes. These LANDSAT results are based on correlation studies between MSS CCT's and 170 water samples taken from three large Kansas reservoirs coincident with 16 different LANDSAT passes over a period of 13 months. Skylab imagery, S190A and S192, from a single pass over three reservoirs, compared favorably to LANDSAT results up to 100 ppm. No samples were obtained with suspended solids greater than 100 ppm during the Skylab overpass. Typical mid-continent values for variables such as sun angle, wind speed, and temperature, do not significantly affect the correlation between satellite band ratios and suspended solids. The relatively high inorganic suspended solids, characteristic of mid-continent reservoirs, dominate the reflected energy present in the satellite spectral bands. Dissolved solids concentrations up to 500 ppm and algal nutrients up to 20 ppm are not detectable. The RED/GREEN ratio may have a weak negative correlation with total chlorophyll above about 8 micrograms/l. (See also W77-08408) (Humphreys - ISWS)

LANDSAT-1 DATA AS IT HAS BEEN APPLIED FOR LAND USE AND WATER QUALITY DATA BY THE VIRGINIA STATE WATER CONTROL BOARD,
Virginia State Water Control Board, Richmond. Div. of Surveillance and Field Studies.
P. L. Trexler, and J. L. Barker.
In: Proceedings of the NASA Earth Resources Survey Symposium, June 1975, Technical Session Presentations, Agriculture-Environment, Volume I-A. Report No. NASA TM X-58168. Symposium held June 9-12, 1975, Houston, Texas, p 371-418, September 1975. 22 fig, 7 tab, 7 ref.

Descriptors: *Water quality, *Land use, *Remote sensing, *Virginia, *Monitoring, Reservoirs, Watersheds(Basins), Land management, Land classification, On-site investigations, Water sampling, Surface waters, Census, Turbidity, Secchi disks, Satellites(Artificial), Spatial distribution, Data processing, Analytical techniques.
Identifiers: LANDSAT, Pixels.

In a joint project with the Virginia State Water Control Board and NASA, water quality monitoring possibilities from LANDSAT were demonstrated, both for direct readings of reflectances from the water and for indirect monitoring of changes in use of land surrounding Swift Creek Reservoir. Film products were shown to have insufficient resolution, and all work was done by digitally processing computer-compatible tapes. Perhaps the greatest potential contribution of LANDSAT is through indirect interpretation, by detecting changes in land cover in a watershed. Land cover maps of the 18,000 hectare Swift Creek Reservoir watershed were prepared for two dates in 1974. A significant decrease in the pine cover was observed in a 740 hectare construction site within the watershed. A measure of the accuracy of classification was obtained by comparing the LANDSAT results with visual classification at five sites on a U-2 photograph. Such changes in land cover can alert personnel to watch for potential changes in water quality. (See also W77-08408) (Humphreys - ISWS)

THE LANDSAT-1 MULTISPECTRAL SCANNER AS A TOOL IN THE CLASSIFICATION OF INLAND LAKES,
National Eutrophication Survey, Corvallis, Oreg.
D. H. P. Boland, and R. J. Blackwell.
In: Proceedings of the NASA Earth Resources Survey Symposium, June 1975, Technical Session Presentations, Agriculture-Environment, Volume I-A. Report No. NASA TM X-58168. Symposium held June 9-12, 1975, Houston, Texas, p 419-442, September 1975. 13 fig, 3 tab, 11 ref.

Descriptors: *Classification, *Lakes, *Water quality, *Remote sensing, *Minnesota, *Michigan, *New York, *Wisconsin, Surface waters, Eutrophication, Trophic level, Data processing, Monitoring, Surveys, Analytical techniques, Satellites(Artificial), Phosphorous, Chlorophyll, Nitrogen, Conductivity.
Identifiers: LANDSAT.

This study focused on relationships between LANDSAT-1 multispectral scanner (MSS) data and the trophic status of a group of lakes located in the north-northeastern part of the United States. MSS data were used to predict the magnitudes of two trophic state indicators, to estimate lake position on a multivariate trophic scale, and to automatically classify lakes according to their trophic state. Initially, principal component ordiantion was employed to ascertain the trophic state of 100 lakes using the indicators: chlorophyll a, conductivity, inverse of Secchi transparency, total phosphorus, total organic nitrogen, and productivity as measured by a standard algal assay yield test. The resultant PCI values were indicative of the lakes' positions on a multivariate trophic scale. MSS data for some 20 lakes were extracted from computer-compatible tapes (CCT's) using a binary marking technique. Output was in the form of descriptive statistics and photographic concatenations. MSS color ratios were incorporated into regression models for the prediction of Secchi disc transparency, chlorophyll a, and lake position on the trophic scale. Lake trophic state-MSS relationships were also examined using three-dimensional color ratio models. Automatic image processing techniques were used in conjunction with MSS data and trophic state index values to classify each

lake pixel-by-pixel. Classification products included both gray scale and color-coded photographic prints. It appears that the LANDSAT-1 MSS has the capability of providing supplemental data relating to water quality in inland lakes. Further refinement in the sensor and the data processing techniques should make multispectral imagery collected from space platforms a valued tool in lake survey and monitoring activities. TROPHIC STATUS OF INLAND LAKES FROM LANDSAT,
Wisconsin Univ., Madison. Inst. for Environmental Studies.
L. T. Fisher, and F. L. Scarpace.
In: Proceedings of the NASA Earth Resources Survey Symposium, June 1975, Technical Session Presentations, Agriculture-Environment, Volume I-A. Report No. NASA TM-X-58168. Symposium held June 9-12, 1975, Houston, Texas, p 443-450, September 1975. 3 fig, 1 tab, 2 ref.

Descriptors: *Lakes, *Water quality, *Wisconsin, *Remote sensing, *Data processing, Analytical techniques, Data storage and retrieval, Costs, Surface waters, Trophic level, Eutrophication, Satellites(Artificial).
Identifiers: LANDSAT.

A cooperative program involving university researchers and natural resource managers utilized LANDSAT data to produce an economical trophic status assessment of 3,000 Wisconsin lakes. Computer programs were developed which allow easy, rapid access to LANDSAT data and which can be used by non-research personnel for production data extraction. Capital expenses were low, and operating costs were very reasonable compared to expenses to acquire on-site data of comparable quality. (See also W77-08408) (Humphreys-ISWS)

THE USE OF LANDSAT-1 IMAGERY FOR WATER QUALITY STUDIES IN SOUTHERN SCANDINAVIA,
Lund Univ., (Sweden). Dept. of Physical Geography.
U. Hellden.
In: Proceedings of the NASA Earth Resources Survey Symposium, June 1975, Technical Session Presentations, Agriculture-Environment, Volume I-A. Report No. NASA TM X-58168. Symposium held June 9-12, 1975, Houston, Texas, p 451-468, September 1975. 12 fig, 15 ref.

Descriptors: *Lakes, *Water quality, *Remote sensing, *Foreign countries, Surface waters, Water pollution, Satellites(Artificial), Data processing, Analytical techniques, Instrumentation.
Identifiers: *Sweden, LANDSAT, Densitometer.

In order to find out the possibilities of using LANDSAT-1 images for environmental studies, with special references to water quality studies, test areas in southern Scandinavia were selected. The MSS images of different bands were compared under the magnification of an Interpretoscope, and densitometric analyses were performed in a Schnellphotometer. The possibility of tracing pollution plumes was studied in the Oresund outs de Copenhagen. The effect of different sewers and the circulation of the polluted water was analyzed in various situations. The variation in reflectivity of a great number of lakes in South and Middle Sweden was studied by means of densitometric analyses, and significant regional differences were found. The correlation with with in situ measurements of water quality of the sampled lakes was fairly good. (See also W77-08408) (Humphreys-ISWS)

REMOTE SENSING APPLICATIONS IN THE INVENTORY AND ANALYSIS OF ENVIRONMENTAL PROBLEMS,
Environmental Protection Agency, Warrenton, Va. Environmental Photographic Interpretation Center.
C. E. Howard, Jr., and C. A. Waters, Jr.
In: Proceedings of the NASA Earth Resources Survey Symposium, June 1975, Technical Session Presentations, Agriculture-Environment, Volume I-A. Report No. NASA TM X-58168. Symposium held June 9-12, 1975, Houston, Texas, p 585-598, September 1975. 10 fig.

Descriptors: *Monitoring, *Environment, *Remote sensing, *Census, Water pollution sources, Air pollution, Feed lots, Landfills, Projects, Satellites(Artificial), Aerial photography, Environmental effects.
Identifiers: LANDSAT, Skylab.

The Environmental Protection Agency, through the Environmental Photographic Interpretation Center (EPIC), is actively engaged in the extraction of environmentally related data from both high resolution and multispectral imaging systems. From its inception, the EPIC has researched the various sensing systems available from both a cost effective and information content standpoint. Through interagency agreements and cooperative programs such as the NASA Aircraft Support Program, imagery has been acquired in areas where EPA has operational requirements. Presently, the efforts of EPIC are directed toward the inventory and analysis of many types of pollution sources, both point and non-point. To date (1975), in its brief 1 1/2 year existence, EPIC has found that the nature of its requirements has almost exclusively demanded the use of high resolution photography. SOME EXPERIMENTAL DATA ON THE STUDY OF THE BIOLOGICAL ACTION OF ETHYLBUTYLAMINE AS A WATER POLLUTION FACTOR, (IN RUSSIAN),
Sanitarno-Gigienicheskii Meditsinskii Institut, Leningrad (USSR). Div. of Public Hygiene.
S. A. Zyabbarova, M. N. Kuklina, and L. E. Yakovleva.
Gig Sanit. 3, p 106-107, 1974.

Descriptors: *Water pollution, Organic compounds, Biology, *Lethal limit, *Water quality standards, *Pollutant identification.
Identifiers: *Ethylbutylamine.

Standardization of ethylbutylamine (EBA) in water bodies was attempted to study its biologic action. EBA is a colorless transparent liquid. It boils at 108 C, has a molecular weight of 101.99, a specific weight of 0.7391, and is soluble in water. It can enter water bodies as a component of sewage water and affects the organoleptic qualities of water (e.g., its smell and taste). Its biological action was studied on white rats and mice. LD50 is 273.2-347.4 mg/kg for rats, and 315.1-514.3 mg/kg for white mice. EBA doses of 0.02, 0.3, and 6 mg/kg were used for 6 mo. Blood tests did not show any changes. Tests on sacrificed animals were more sensitive, indicating a decrease of vitamin C content in the liver for 6 mg/kg EBA. For 3 mg/kg EBA, adrenal glands' weight coefficient increased, while spleen weight coefficient decreased. The adrenal glands weight coefficient in animals given 6 mg/kg was similar to the one in the control group, while the decrease observed in the spleen weight coefficient was statistically unreliable. Histological studies did not show intoxication in internal organs. A 0.5 mg/l (0.025 mg/kg) concentration of EBA in water has no toxic effect. The 0.5 mg/l EBA concentration in water bodies is recommended as the allowed level.--Copyright 1975, Biological Abstracts, Inc.

INVERTEBRATE COLONIZATION OF ARTIFICIAL SUBSTRATES IN SAN LEANDRO CREEK,
California Univ., Berkeley. Dept. of Forestry and Conservation.
K. B. Roby.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-268 067, Price codes: A04 in paper copy, A01 in microfiche. Master of Science Thesis, (1976). 63 p, 14 fig, 8 tab, 52 ref. (California Water Resources Center Project UCAL-WRC-W-411). OWRT-A-047-CAL(1).

Descriptors: *Invertebrates, *Artificial substrates, *Benthic fauna, Water quality, *California, *Bioindicators, Sampling, Monitoring, Variability, *Instrumentation, Pollutant identification.
Identifiers: *San Leandro Creek(Calif), Berkeley area(Calif).

In recent years much attention has been given to the use of artificial substrates for sampling benthic communities. The major impetus for their increased use comes from the Environmental Protection Agency's use of artificial substrates in water quality monitoring. The general consensus of workers who have used artificial substrates is that they possess advantages not found in more traditional benthic sampling methods. Uniform habitat and surface area, reduced sampling time and difficulty are among the quoted attributes of artificial substrates. After one summer of mixed results, it was decided to scrutinize the effectiveness of the sampler. A small stream comparable to others sampled during the project was chosen near the Berkeley Campus. The objective was to investigate the factors affecting the performance of the sampler. Specifically, information concerning the colonization time and identification of factors causing variability was acquired, and some tentative evaluations were attempted. (Snyder-California, Davis)

WATER-QUALITY RECORDS FOR SELECTED RESERVOIRS IN TEXAS, 1974-75 WATER YEARS,
Geological Survey, Austin, Tex. Water Resources Div.
J. Rawson, and E. S. Chitwood.
Texas Water Development Board, Austin, 1977. 169 p, 18 fig, 84 tab, 13 ref.

Descriptors: *Water quality, *Reservoirs, *Texas, Water analysis, Chemical analysis, Dissolved solids, Dissolved oxygen, Hydrogen ion concentration, Water temperature.

Periodically since October 1961, the U.S. Geological Survey, in cooperation with State, Federal, and local agencies, has made comprehensive water-quality surveys of selected reservoirs in Texas. During the 1970 water year, the program was expanded to include periodic sampling of many other reservoirs in the State where water-quality surveys were not made. Water-quality data collected before October 1973 have been published previously. This report contains the results of water-quality surveys of 17 reservoirs and chemical analyses of samples collected periodically from 58 reservoirs. (Woodard-USGS)

DESIGN OF A WATER QUALITY MONITORING NETWORK,
North Carolina Univ. at Chapel Hill. Dept. of Environmental Sciences and Engineering.
R. A. Berndt.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-268 520, Price codes: A05 in paper copy, A01 in microfiche. M.S. Thesis, 1975. 89 p, 13 fig, 14 tab, 17 ref. OWRT A-065-NC(1). 14-31-0001-4033.

Descriptors: Sampling, *Priorities, Design, *Networks, Water quality, *Monitoring, *Water quality standards, *Design criteria, Pollutant identification, Water analysis.
Identifiers: *Water quality monitoring network.

The aim is to examine the design of a water quality monitoring network for the objective of enforcement of water quality standards. The strategy for monitoring consists of the parameters sampled, the number and location of sampling stations, and the frequency of sampling. Parameters sampled are essentially those included in the water quality standards. Principal component analysis is used to identify important parameters. Number of sampling stations is dependent on the available resources of the monitoring agency. Priority among the total stations is determined by probability of violation, principal component analysis, population density and graphical technique. Information content and t tests are used to determine frequency of sampling. (Stewart-NC State)

BACTERIAL GROWTH ON DISSOLVED ORGANIC COMPOUNDS IN FRESH-WATER RESERVOIRS, (IN RUSSIAN),
Akademiya Nauk SSSR, Moscow. Institut Biologii Vnutrennykh Vod.
V. I. Romanenko, and E. P. Nikiforova.
Mikrobiologiya 43(1), p 133-137, 1974.

Descriptors: *Bacteria, Organic matter, *Organic compounds, *Pollutant identification, Reservoirs, Filters, *Mycobacterium.
Identifiers: Agar, USSR, Oligocarbophilic bacteria, *Membrane filter technique, *Bacterial growth, *Rybinsk reservoir(USSR).

Water from the Rybinsk reservoir (USSR) filtered through an asbestos filter, was used as a growth medium for bacteria. The content of dissolved organic substance in the medium was 13.4 mg C/l. Flasks containing 100 ml of the medium were sterilized and inoculated with several drops of water. The absence of bacterial cells in the medium enabled monitoring of the growth of oligocarbophilic bacteria by direct count on membrane filters. The bacterial growth was very intensive in this medium at 20-26C, the generation time was 1-3 h. The bacterial number, calculated by direct count and by counting the number of colonies on MPA meat peptone agar was the same during the intensive growth. Lower amounts of the bacteria were detected after prolonged storage on MPA. The growth rate of mycobacteria was highest in this medium.--Copyright 1975, Biological Abstracts, Inc.

CRYSTAL STRUCTURE ANALYSIS OF SELECTED PESTICIDES BY SINGLE CRYSTAL X-RAY DIFFRACTION: THE CRYSTAL AND MOLECULAR STRUCTURE OF PADAN,
Rhode Island Univ., Kingston. Dept. of Chemistry.
F. J. Pickles.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-268 579, Price codes: A04 in paper copy, A01 in microfiche. M. S. Thesis, 1975. 46 p, 3 fig, 17 tab, 33 ref. OWRT A-051-RI(2). 14-31-001-5040.

Descriptors: *Pesticides, *Pesticide residues, *Molecular structure, *Crystallography, *Pollutant identification, *X-ray diffraction, Insecticides, Chlorinated hydrocarbon pesticides, Chemical analysis.
Identifiers: *Padan, Nereistoxin, Chloinergic activity, Structure - activity correlation.

The solution of the crystal and molecular structure of Padan by single crystal X-ray diffraction confirmed that the compound under investigation is 1, 3-bis(thiocarbamoyl)-2-N,N-dimethylamino-propane hydrochloride. The results show that the structure of Padan is very similar to that of acetylcholine. This similarity suggests that the toxicity of this insecticide may be due to its activity in cholinergic systems.

A METHOD FOR QUANTITATIVE DETERMINATION OF AMMONIFYING AND DENITRIFYING BACTERIA IN WATER WITH APPLIED EXAMPLES FROM GRAVEL-PIT POOLS, (IN CZECH),
Slovenska Akademie Vied, Bratislava (Czechoslovakia). Limnobiologisches Institut.
I. Daubner, and R. Ritter.
Int Rev Gesamten Hydrobiol. 57(4), p 517-522, 1972.

Descriptors: *Bacteria, *Pollutant identification, Ponds, Gravel pits, Methodology, *Denitrification, *Analytical techniques, *Ammonification.
Identifiers: *Ammonifying bacteria, *Denitrifying bacteria, Gravel pits, *Membrane filter technique.

Using a new and simple membrane filter technique, the determination of ammonifying and denitrifying bacteria in water together with their identification 'in situ' was achieved. The membrane filter (MF) together with the grown bacterial colonies is either put on a paper filter saturated with the reagents or the reagents are applied dropwise to another wet sterile MF laid on top of the original. After 1-2 min the positive (colored) colonies are counted. The method was compared with the 'MPN'-method (most probable number) on different water samples and was applied during 1970 in investigations on gravel-pit pools. This method gives sightly higher bacterial counts than the MPN-method, but only in 1 instance was the difference significant. The method is precise and rapid, thus it is suitable for routine work.--Copyright 1975, Biological Abstracts, Inc.

POLLUTION INDICATOR BACTERIA ASSOCIATED WITH MUNICIPAL RAW AND DRINKING WATER SUPPLIES,
Ontario Ministry of the Environment, Rexdale. Lab. Service Branch.
J. A. Clark, and J. E. Pagel.
Canadian Journal of Microbiology, Vol. 23, No. 4, p 465-470, April, 1977. 2 tab, 11 ref.

Descriptors: *Bacteria, *Pollutant identification, *Bioindicators, *Potable water, *Municipal water, Analysis, Microorganisms, Analytical techniques, *Public health, Membrane processes, Fermentation, Water supply.
Identifiers: Most probable number technique.

The membrane filter (MF) and presence-absence (P-A) methods were used to determine the relative frequencies of the most commonly isolated pollution indicator bacteria associated with raw and drinking waters. A total of 3819 bacterial cultures were isolated in samples from 55 Ontario municipalities. The cultures were 82% Enterobacteriaceae and 18% oxidase-positive organisms. The Enterobacteriaceae were 92% lactose fermenters; 59% of these were aerogenic at 35 C and 14% at 44.5 C. Seventy-six percent of the oxidase-positive organisms were negative for lactose fermentation. About 1% of the lactose-fermenting cultures were aerogenic and oxidase-positive at 35 C. Frequency distributions were similar for both raw and drinking water isolations, but Escherichia doubled their frequency in raw water. Klebsiella organisms were preferentially cultured from MF plates and Enterobacter were isolated about twice as frequently as other coliform genera studied. The MF technique would not detect non-lactose fermenting coliform colonies, but this could be offset by the Aeromonas colonies. Coliform isolates would be undetected by the MPN technique because at least 25% were either anaerogenic or non-lactose fermenters. (Collins-FIRL)

MATING PSEUDOMONAS AERUGINOSA DENSITIES IN WATER,
Canada Centre for Inland Waters, Burlington (Ontario).
B. J. Dutka, and K. K. Kwan.
Applied and Environmental Microbiology, Vol. 33, No. 2, p 240-245, February, 1977. 1 fig, 6 tab, 18 ref.

Descriptors: *Analytical techniques, *Filtration, *Membranes, *Pseudomonas, Performance, *Bacteria, Coliforms, Separation techniques, Analysis, Waste water treatment, *Bioindicators, Pollutant identification, Pathogenic bacteria.
Identifiers: Brodsky-Nixon MacConkey agar-membrane filtration, Most-probable-number(MPN).

Pseudomonas aeruginosa concentrations in water have become recognized as an indicator of pollution and as a pathogen. Determination procedures have been developed including membrane filtration and most-probable-number (MPN). Two membrane filter processes and MPN were compared to determine their relative efficiencies in enumerating P. aeruginosa from Canadian water and sewage samples. The Brodsky-Nixon MacConkey agar-membrane filtration procedure was a 24-hour procedure using a commercially available medium. Density estimates were based on the presence of fluorescence. It was found that large coliform populations interfered with the development of P. aeruginosa colonies. The method was judged unsuitable for application to natural and effluent waters. The other membrane filter process employed proline and ethanol. Results indicated that the specificity of membrane filter procedures confirmed 92-99% of the organisms as P. aeruginosa, while MPN verification rates varied from 64 to 86%. For all but sewage samples, a 3-4 day incubation period at 41.5 C provides the best data results with membrane filtration. This procedure, with mPA or mPA medium B, is a simple and rapid technique which avoids the extended procedures necessitated by the MPN technique. (Collins-FIRL)

ENTEROVIRUS TYPES IN ISRAEL SEWAGE,
Hadassah Medical School, Jerusalem (Israel).
B. Fattal, and M. Nishmi.
Water Research, Vol. 11, No. 4, p 393-396, 1977. 1 fig, 2 tab, 16 ref. EPA S-800990.

Descriptors: *Viruses, *Pollutant identification, *Analytical techniques, Public health, Diseases, Microorganisms, Analysis, Microbiology, Water pollution sources, Waste water treatment, Sewers, Enteric bacteria.
Identifiers: *Israel.

Picked virus and neutralization test methods were described for the isolation and identification of enteroviruses in the sewage of various Israeli communities. Grab and gauze pad methods were used to collect the sewage samples. The first method resulted in the finding of 489 isolates. These included 74% polioviruses; 10% Coxsackie Type B, Coxsackie A9 or Echo 9; and 16% Echo and other strains of enteroviruses. Fifty-two samples were tested for polio and non-polio viruses with the neutralization method. An average of 37% were found to be polioviruses. These percentages were higher than those obtained with other test methods. Regular virus monitoring of sewage would give a qualitative view of the enteroviruses in sewage and of the prevalence of enteroviral diseases of the population. (Collins-FIRL)

RAPID AGAR POUR-PLATE TECHNIQUE FOR DETECTION AND ENUMERATION OF FAECAL COLIFORMS IN SEWAGE,
National Environmental Engineering Research Inst., Nagpur (India).
P. M. Phirke.
Indian Journal of Environmental Health, Vol. 18, No. 3, p 183-190, July, 1976. 4 tab, 16 ref.

Descriptors: *Analytical techniques, *Pollutant identification, *Coliforms, Pollutants, Sewage treatment, Waste water treatment, Analysis, *Bacteria, Sewage effluents, Water pollution control.
Identifiers: Most-probable-number(MPN), Rapid agar pour-plate method.

The rapid agar pour-plate technique was developed to estimate coliform populations in sewage. The technique involved the homogenization of sewage samples which were then mixed with a sterile saline solution. Appropriate dilutions were placed in separate sterile petri dishes. Rapid agar, melted and cooled to 50-55 C, was added to the petri dishes and thorough mixing followed. Incubation at 41.5 C + 0.5 C in a water-jacketed air incubator for 7 to 8 hours followed solidification of the medium. After incubation, the yellow or orange coliform colonies were counted with a Qubec colony counter. Necessary computations were then made to adjust the results for tabulation. The technique was found to be quite sensitive and reliable. Results were consistent and reproducible with a 12.63% to 12.93% coefficient of variation. A specificity for fecal coliforms was a prime characteristic of this technique and comparisons with the MPN procedure revealed no significant differences. This method has the advantage of yielding absolute numbers as test results. (Collins-FIRL)

IMPROVED METHOD FOR THE DETERMINATION OF ETHYLENEDIAMINETETRAACETIC ACID IN AQUEOUS ENVIRONMENTAL SAMPLES BY GAS-LIQUID CHROMATOGRAPHY,
Water Pollution Research Lab., Stevenage (England).
J. Gardiner.
The Analyst, Vol. 102, No. 1211, p 120-123, February, 1977. 1 fig, 2 tab, 3 ref.

Descriptors: *Analytical techniques, *Chromatography, *Chemical reactions, *Pollutant identification, Liquid wastes, Sewage treatment, Waste water treatment, Laboratory tests, Analysis, Water purification, *Organic acids, Gas Chromatography.
Identifiers: *Ethylenediaminetraacetic acid.

The determination of ethylenediaaminetetraacetic acid (EDTA) in sewage, sewage effluents, and rivers is important because EDTA might lower the effect of adsorption and precipitation reactions in removing trace metal contaminants. Colorimetric and complexomtric analytical methods were unsuccessful; gas-liquid chromatography dterminations presented problems. A method was proposed using 1,6-hexanediaminetetraacetic acid (HDTA) as an internal standard. The sample is filtered and the filtrate is extracted with chloroform; it is then acidified with formic acid and the HDTA is added. After evaporation, but before precipitation, the filtrate is rinsed and further evaporated under a stream of nitrogen and in an oven. The tube is drawn in the middle in a gas-oxygen flame, and an esterifying solution is added. The tube is sealed, placed in boiling water, and centrifuged in a tube containing a phosphate buffer solution. After separation, the chloroform layer is transferred to a small sample tube and evaporated in the solvent under a nitrogen stream. The residue is dissolved in acetone and injected on to the gas-liquid chromatographic column. The mean recovery for this method is 98.6% with a 13.1% standard deviation. (Collins-FIRL)

CHLOROBIPHENYLS AND PCB'S: FORMATION DURING CHLORINATION,
Georgia State Univ., Atlanta. Dept. of Biology.
P. E. Gaffney.
Journal Water Pollution Control Federation, Vol. 49, No. 3, p 401-404, March, 1977. 3 tab, 14 ref.

Descriptors: *Chlorination, *Disinfection, *Polychlorinated biphenyls, Municipal wastes, Industrial wastes, Treatment facilities, Toxicity, Chemical reactions, Analytical techniques, Chromatography, *Waste water treatment.
Identifiers: *Chlorobiphenyls.

A study was conducted to discover if chlorobiphenyls were produced during actual and laboratory simulation of water and waste water treatment plant operation. Samples were spiked with biphenyl and chlorinated, extracted with hexane, and analyzed by gas chromatography. Results showed that various chlorobiphenyl isomers were produced during final chlorination. These and other organochlorines were produced in the laboratory chlorination of municipal plant influent and effluent. Mono- and dichlorobiphenyl were produced in the absence of iron; more were produced in its presence. Laboratory chlorination slightly increased dichlorobiphenyls concentrations in influents, but reduced them in effluents. Studies are being continued on the effect of these compounds on water and waste water treatment, on downstream ecosystems, and on water use. (Collins-FIRL)

IMPROVED GALVANIC DISSOLVED OXYGEN SENSOR FOR ACTIVATED SLUDGE,
Fischer and Porter Co., Warminster, Pa.
R. Poole, and J. Morrow.
Journal Water Pollution Control Federation, Vol. 49, No. 3, p 422-428, March, 1977. 7 fig, 9 ref.

Descriptors: *Pollutant identification, *Dissolved oxygen, *Monitoring, *Measurement, Equipment, *Activated sludge, Membranes, Electrolytes, Electrodes, Mechanical engineering, Analysis, *Waste water treatment.
Identifiers: Galvanic sensor.

A galvanic dissolved oxygen sensor which uses gold as the cathode and copper as the anode was developed. The gold electrode is covered with a gas-permeable, liquid impermeable teflon membrane to separate the cell from the test solution. The interior chamber has an electrolyte capacity of 60 centimeters. A thermistor is cemented to the sensor body. The sensor can operate continuously for 15 months before recharge is necessary. The membrane is easily replaced in field operation and good temperature compensation results from its exposure to constant load resistance at all temperatures. Field tests produced good results in aeration tanks. Agitators are not necessary when the sensor is used in aeration tanks. (Collins-FIRL)

DETERMINATION OF BOD AFTER FREEZING WATER SAMPLES (BESTIMMUNG DES BSB NACH EINFRIERUNG DER WASSERPROBEN),
B. Wachs.
Munchner Beitrage zur Abwasser-, Fischerei- und Flussbiologie, Vol 27, p 179-204, 1977. 12 fig, 9 tab, 28 ref.

Descriptors: *Pollutant identification, *Analytical techniques, *Freezing, *Biochemical oxygen demand, Bacteria, Flocculations, Temperature, Chemical oxygen demand, Organic matter, Carbon, *Waste water treatment, Chemical properties.

The effect of freezing and storing waste water samples on their biochemical and chemical parameters was studied. Waste water samples that cannot be analyzed on the site should be stored deep-frozen at -40 to -70C. Since a high percentage of the bacteria are irreversibly damaged by deep-freezing, samples thawed after such storage should be inoculated with mechanically or biologi-

cally purified municipal waste water before BOD measurement. As freezing results in the flocculation of additional organic substance that remains in the sample, it is necessary to eliminate the settling substances before freezing. With a BOD5 range of 10-50 mg/liter, storage at -20 to -30C can result in BOD5 losses of up to 20% compared with those of a fresh sample. The loss does not exceed 10% in a BOD5 range of 50-2,000 mg/liter. The BOD5, COD and TOC values measured in samples with BOD5 over 2,000 mg/liter, and stored at the above temperature, may be higher than those measured in fresh samples. The chemical and bacteriological parameters decrease progressively with storage time in the frozen state, especially in samples with low organic matter content, and in samples frozen and stored at relatively high subzero temperatures. (Takacs-FIRL)

SUSPENDED SOLIDS MEASUREMENT GIVES IMPROVED CONTROL,
Instruments (H. F.) Ltd., Bolton (Ontario).
E. S. Posgate.
Water and Wastes Engineering, Vol. 14, No. 3, p 30, 32, 35-36, March, 1977. 5 fig.

Descriptors: *Measurement, *Monitoring, *Automatic controls, Analysis, Equipment, *Suspended solids, Polymers, Flow rates, Physical properties, Chemical properties, Waste water treatment, Water purification.
Identifiers: Turbidimeters.

Turbidimeters have been adapted for monitoring and control at water and waste water plants. These reduce costs by regulating chemical input to actual demand. The basic process is a combination of gravimetric analysis with linear instruments for direct measurement in ppm of suspended solids. Factors involved in the use of this equipment are the type of water source, upstream discharges to the water source, seasonal climate, and weather changes. There is not a simple answer to what suspensions can be monitored directly. The major factor is that the suspension have uniform characteristics over a long term. Possible applications are moitoring activated sludge concentration and controlling flow rate for return to the primary stage, proportioning polymer input in sludge dewatering, final effluent monitoring, measuring sludge volume index, and making daily suspended solids measurements in advanced treatment systems. The automactic control system can reduce costs. (Collins-FIRL)

RELIABLE PH MEASUREMENT WHEN EFFLUENT CONDITIONS GET TOUGH,
Electrofact, Plymouth, Minn.
R. J. Kidder.
Pollution Engineering, Vol 9, No 4, p 30-33, April, 1977. 5 fig.

Descriptors: *Pollutant identification, *Automatic controls, *Hydrogen ion concentration, *Measurement, Instrumentation, Electrodes, Electrical properties, Monitoring, Equipment, Treatment facilities, Waste water treatment.

The reliability and use of pH measurement by automated systems was evaluated. Many components are available, and it was suggested that proper selection would produce a reliable and trouble-free system. Electrical components were listed and their electrical characteristics were briefly described, as were the problems associated with them. The reference electrodes discussed were of two types: diffusion or solid state electrodes, and flowing junction electrodes. Measuring electrodes were described and their design criteria were presented. They should be able to tolerate wide pH variations without chemical attack at ambient temperature, be suited to low pH solutions at high temperatues, and they should be constructed to provide suitable operation at low temperatures. Installation problems include unreliable or erroneous readings from common mode or ground loop voltages and fouling by filming or solid deposits. Various solutions were offered for these problems. Descriptors: *Oil spills, *Oil-water interfaces, *Waves(Water), *Films, *Wind velocity, *Turbulent boundary layers, Oil pollution, Laboratory tests, Path of pollutants.
Identifiers: *Oil slicks, *Drift velocities, *Wind-generated waves, *Mechanically-generated waves, *Wave steepness, *Surface film convection, *Stokes waves, Laboratory wind-wave channel, Pollution control operations, Estuaries, Oceans.

Oil spillage into the marine environment has become a serious problem in recent years. The analysis of the convection of an oil slick under oceanic conditions is an essential tool for pollution control operations. The drift of an oil slick on the sea is under the influence of both wind and waves. Research was initiated to study the convection of a surface film under the action of wind- and mechanically-generated waves in a laboratory wind-wave channel by using polyethylene sheets. In order to simulate the drift of an oil slick in a laboratory channel, the film size should be greater than two wavelengths for the wind-waves and one wavelength for mechanically-generated waves. The drift velocity over wind-waves is a function of wind velocity and wave steepness. However, the ratio of drift velocity to the shear velocity of the turbulent air boundary layer was found to correlate uniquely with the wave steepness for sufficiently large wave steepness. For the mechanically-generated waves, the film drift velocity is larger than the surface particle drift of the Stokes waves. In a wave field characterized by wave steepness, the effect of the wind on the drift velocity of surface films predominates over that due to waves. (de Lara-Connecticut)

THE INFLUENCE OF PRECIPITATION ON BIOCHEMICAL OXYGEN DEMAND ON NINE STREAMS IN NEW JERSEY,
Rutgers - The State Univ., New Brunswick, N.J. Dept. of Geography.
D. V. Dunlap.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-267 724, Price codes: A07 in paper copy, A01 in microfiche. Ph.D. Dissertation, January 1976, 114 p, 6 fig, 11 tab, 62 ref, 4 append. OWRT A-025-NJ(11). 14-31-0001-3830.

Descriptors: *Biochemical oxygen demand, *New Jersey, *Precipitation(Atmospheric), *Streams, *Streamflow, Temperature, Spatial distribution, Temporal distribution, *Air temperature.

The influence of precipitation, streamflow and temperature on biochemical oxygen demand (BOD) on nine streams in central and northern New Jersey is examined with the goal of determining the time factors and spatial distribution of BOD as influenced by precipitation. From August 1969 to March 1972, 530 samples were taken with simultaneous observations of BOD concentration, streamflow, and air temperature (as an approximation to water temperature), along with precipitation for various time periods prior to observation time. Sites were chosen in sandy and clay soils, and for each soil texture there was a wooded area, a farm area and a residential area. Most of the watersheds covered areas of less than 11 square miles, but one was a river basin of 258 square miles. Stepwise regression techniques were applied to the data using precipitation intervals ranging from 1 to 24 hours duration. Short-term intervals of precipitation from 1 to 6 hrs. were the most effective time periods for the regression equations. Streamflow and BOD concentrations were both so closely related to BOD load that they were dropped from the models. Air temperature seemed to have little effect on the response of BOD load. Bivariate linear regression was undertaken to determine if any direct relationship might exist between BOD load and various periods of antecedent precipitation. Precipitation in the 6 to 12 hours prior to observation time appears to be most closely related to BOD load in the 4 watersheds with the most observations. Significant seasonal differences were manifested. The correlation of streamflow and BOD load was found to be statistically significant on 5 of the streams investigated, with major differences between different streams.

Descriptors: *Water circulation, *Winds, *Lake Erie, *Model studies, Lakes, Mathematical models, Currents(Water), Circulation, Pollutants, Effects, Water pollution, Dispersion, Path of pollutants, Suspended solids, Airports, Islands, Hydrodynamics.
Identifiers: Wind-driven currents, Jetport effects.

The wind-driven circulation and dispersion of contaminants in a near-shore region of Lake Erie were studied by means of numerical models. The first problem studied was that of the thickness of the coastal boundary layer in a large lake. In this study, the non-linear acceleration and Coriolis force terms were included in the equations of motion. Next, a major study of the steady-state and time-dependent currents in the near-shore Cleveland area of Lake Erie, under present conditions and as modified by large man-made structures or islands, e.g., a jetport in the lake, was made. The effects of (1) a jetport island approximately 6 miles offshore of Cleveland, and (2) a land-fill extension of this island to shore, were examined in detail. The island was found not to affect the flow appreciably, while the extension to the shore modified the flow significantly. The calculations generally required a fine near-shore grid coupled with a coarser off-shore grid. In time-dependent calculations, a small time step was used in the near-shore, while a larger one was used in the offshore. The proper coupling procedure was studied in detail. The three-dimensional, time-dependent dispersion equation has been solved for various conditions. A vertically stretched coordinate system was used to incorporate the variable bottom topography. The flow and dispersion of a contaminant from a point source (the Cuyahoga River) in the near-shore were studied, using the velocities obtained from the numerical hydrodynamic models. Effects of horizontal diffusion, gravitational settling, and bottom boundary conditions were examined. With some modification, the numerical models developed in this report can be applied to study the near-shore regions of other large lakes and the Ocean. (Sims-ISWS)

Descriptors: *Path of pollutants, *Water temperature, *Unsteady flow, *Model studies, Mathematical models, Water quality, Temperature, Distribution patterns, Powerplants, Nuclear powerplants, Hydroelectric plants, Heat, Heated water, Cooling water, Reservoirs, Estuaries, Water pollution, *Thermal pollution, Flow, Heat transfer, Discharge(Water), Pollution, *Pennsylvania, *Maryland.
Identifiers: *Temperature distribution, *Conowingo Reservoir(Penn-Md).

The factors contributing to the heat exchange across the free surface of a body of water were reviewed, and quantitative relationships for the calculation of the heat fluxes were summarized. Mathematical models were described which determine the temperature distribution in natural bodies of water. A one dimensional steady model in which the temperature distribution is a function of longitudinal distance was used to show that, when the longitudinal variation of water temperatures is small (up to 10 F), the influence of the water surface temperature variation on the widely used surface heat transfer coefficient can be neglected. Another mode was a one dimensional unsteady model in which the temperature distribution is a function of longitudinal distance and time. The flow was unsteady and non-uniform, and meteorological conditions and boundary conditions were compared with measurements of natural water temperatures in Conowingo Reservoir during various periods of time in April and September 1972. SANITARY AND HYGIENIC CHARACTERISTICS OF SUBSURFACE WATERS OF THE TSELINOGRAD AND TURGAI OBLASTS, (IN RUSSIAN),
Tselinogradskii Meditsinskii Institut (USSR). Dept. of General Hygiene.
N. I. Anan'ev.
Gig Sanit. 4, p 206-208, 1974.

Descriptors: Public health, Subsurface waters, *Groundwater, *Aquifers, Mineralogy, *Iron, *Fluoride, Artesian waters, Desalination, Water purification, Potable, Waste water treatment.
Identifiers: Oblasts, Tselinograd, Turgai, USSR.

In chemical composition the groundwaters of the Tselinograd and Turgai districts in the Kazakh SSR, USSR, are distinguished by considerable diversity even in the same aquifer and after by high mineralization. A relatively high Fe content and low F content was noted in the water of almost all aquifers. The alluvial infiltration waters or river valleys, having low mineralization, good discharge and sufficient supplies, are most promising for supplying populated areas. Because of their stagnant nature and high mineralization, the artesian waters are unsuitable for drinking, but can be used after distillation plants.--Copyright 1975, Biological Abstracts, Inc.

THE ACCUMULATION AND DISTRIBUTION OF ORGANOCHLORINES AND SOME HEAVY METALS IN AMERICAN FALLS RESERVOIR FISHES, WATER AND SEDIMENT,
Idaho State Univ., Pocatello. Dept. of Zoology.
J. C. Kent.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-267 914, Price codes: A05 in paper copy, A01 in microfiche. M.S. Thesis, 1976. 79 p, 6 fig, 8 tab, 102 ref. OWRT A-043-IDA(1), 14-34-0001-6013.

Descriptors: Reservoirs, Sediments, *Chlorinated hydrocarbon pesticides, *DDT, *Dieldrin, *Polychlorinated biphenyls, *Mercury, Water pollution, *Cadmium, Metals, Fish, *Idaho, *Heavy metals, Distribution, Path of pollutants, *Pesticide residues, Lethal limit.
Identifiers: *American Falls Reservoir(Idaho), *Organochlorines.

Chlorinated hydrocarbon residues (DDT metabolites, dieldrin, and PCB's) were found in fish flesh samples and sediment in American Falls Reservoir. The concentration and type of chlorinated hydrocarbon varied with fish species and age. The mean value for PCB's in large suckers was 671/ug/kg. The Environmental Protection Agency has recommended PCB concentrations in any sample consumed by any bird or mammal be no greater than 500 ug/kg. Chlorinated hydrocarbons were not detected in the water samples. Mercury and cadmium were found in all species analyzed for those particular metals. Results indicate that the Food and Drug Administration's standard of 0.5 mg/kg may be exceeded in crappie, suckers, and large rainbow trout. The mean value for mercury in water was 0.9 ug/1. The Environmental Protection Agency has recommended for the protection of fish and predatory aquatic organisms, that total mercury concentration in unfiltered water should not exceed 0.2 ug/1 at any time or place. The World Health Organization has recommended daily intake of cadmium not be more than 70 ug/day. Consumption of fishes from the reservoir would exceed the recommended limit. The maximum concentration of cadmium in the water was seven times the value given by the National Academy of Sciences, considered to be an environmental threat. Arsenic was found only in the sediments and water. It was not detected in any of the fishes sampled.

Descriptors: *Sewage disposal, Soil water, *Decomposing organic matter, *Waste disposal, Computer models, Carbon, *Carbon dioxide, Sewage sludge, Ammonium, *Nitrates, Temperature, Soil moisture, Nitrogen, *Soil contamination.
Identifiers: *Organic carbon.

A quantitative study of rate of sewage sludge decomposition in soil was made, with emphasis on the effect of soil moisture content and soil temperature on rate of release of CO2, NH4 and NO3. Sewage sludge was found to contain two families of organic compounds, one group which decomposed rapidly and one group that resisted decomposition. The half life of sewage sludge in soil was found to vary with the amount of sewage sludge added to soil. A model describing the decomposition of sewage sludge in soil was prepared.

THE INFLUENCE OF BRACKISH-WATER INTRUSION ON MACROINVERTEBRATE ASSOCIATIONS OF THE LOWER TCHEFUNCTE RIVER, LOUISIANA,
New Orleans Univ., La. Dept. of Biological Sciences.
M. M. Mulino.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-267 933, Price codes: A06 in paper copy, A01 in microfiche. M.S. Thesis, August 1975. 99 p, 1 fig, 13 tab, 65 ref. OWRT A-038-LA(1).

Descriptors: Estuarine environment, Chemical analysis, *Invertebrates, Bioindicators, *Brackish water, *Louisiana, Lakes, Surveys, Ecology, *Saline water intrusion, Water pollution.

Identifiers: Lake Pontchartrain(La), Estuarine pollution, *Tchefuncte River(La).

An ecological survey was conducted of the lower Tchefuncte River, Louisiana, June-November 1974. The Tchefuncte drains into Lake Pontchartrain, a large oligohaline estuary. Brackish lake water enters the river channel when flow is minimal. Maximum extent of brackish-water intrusion was determined as approximately 9 miles from the river mouth during October. Eighty-six macroinvertebrate taxa were collected in the study area, 17 marine and 69 predominantly fresh-water. Balanus improvisus, Victorella pavida, Rithropanopeus harrisii, Gammarus sp., Melita nitida, and an unidentified polyclad flatworm existed at the river mouth in limnetic conditions and colonized upriver habitats during maximum brackish-water intrusion when salinity reached approximately 0.79 ppt in these areas. These organisms are proposed as short-term indicators of the extent of brackish-water intrusion. Rangia cuneata, Congeria leucophaeta, and Cordylophora caspia existed under limnetic conditions only in the tidal area of the river. Since these organisms appear dependent upon brackish water for their continued existence in the river, they are proposed as long-term indicators of the extent of brackish-water intrusion. Physicochemical parameters measured included salinity, specific conductance, chlorides, turbidity, color, settleable matter, pH, phenolphthalein alkalinity, total alkalinity, free carbon dioxide, dissolved oxygen, total hardness, sulfate, ammonium nitrogen, nitrate nitrogen, orthophosphate, and total iron. These parameters are discussed in relation to seasonal trends and in relation to similar ones in comparable habitats.

DIFFUSE AGRICULTURAL POLLUTION: THE ECONOMIC ANALYSIS OF ALTERNATIVE CONTROLS,
Wisconsin Univ. Madison. Dept. of Agricultural Economics.
R. R. Schneider.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-268 126, Price codes: A10 in paper copy, A01 in microfiche. Ph.D. Thesis, 1976. 190 p, 29 fig, 57 tab, 8 maps, 67 ref, 3 append. OWRT A-063-WIS(1). 14-31-0001-4050.

Descriptors: *Economics, Regulation, Water pollution control, *Sediments, *Nutrients, Agriculture, *Management, *Fertilizers, *Costs, *Wisconsin, Dairy industry, *Agricultural runoff, Water pollution sources, Farm wastes, *Nitrates, Groundwater, Nitrogen, Path of pollutants, Alternative costs.
Identifiers: *Dairy farms.

The study examines policies designed to curtail 3 types of diffuse agricultural pollution, namely, 1. runoff from winter-spread manures; 2. sediment in rill and sheet erosion; 3. nitrate pollution of the ground water resulting from field-applied manure and chemical nitrogen. Policies tested on 4 farm sizes at 4 locations are: 1. enforce Wisconsin's Model Sediment Control Ordinance; 2. prohibit manure spreading in winter; 3. prohibit winter manure spreading on sloped land; 4. prohibit winter manure spreading close to streams, lakes and open ditches; 5. restrict excess of applied nitrogen over estimated plant uptake of nitrogen; 6. combine 1, 3, 4 and 5 above; 7. combine 1, 2 and 5 above; 8. restrict average total sediment yield. Effects of these policies in the glaciated and unglaciated regions of the state are explored. Estimation of appropriate data for the economic analysis (partial competitive equilibrium) is an integral part of the study. Marginal cost of pollution reduction is calculated for each policy and a cost curve is generated for a sediment policy on selected farms. Data include physical quantities of pollutant reduction. Major conclusions are: 1. Sediment limit should be differentiated by region; 2. Sediment limits based on ton/acre/farm is superior to ton/acre/field; 3. Nitrate pollution from manure and chemicals is unlikely to be a major problem in Wisconsin; 4. Assuming compliance, the restriction of winter-spread manure to slopes of 4 percent or less is superior to complete prohibition of winter spreading.

STATISTICAL CHARACTERIZATION OF DILUTE PARTICULATE SUSPENSIONS IN TURBULENT FLUID FIELDS,
Illinois Univ. at Urbana-Champaign. Dept. of Nuclear Engineering.
C. C. Meek.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-268 052, Price codes: A09 in paper copy, A01 in microfiche. Ph.D. Thesis, 1972. 174 p, 54 fig, 4 tab, 33 ref, 4 append. OWRT A-019-ILL(4), B-042-ILL(2). 14-31-0001-3077.

Descriptors: *Dispersion, *Turbulent flow, *Water pollution, Air pollution, Instrumentation, *Turbulence, *Sedimentation, *Velocity, *Particle size, Particle shape, Isotropy.
Identifiers: *Particulate transport, Particulate behavior, Stokesian drag.

Analytically, a theory simplified by the restrictive constraints of isotropy and Stokesian drag has been developed. Assumption of a reasonable particle energy spectrum allowed calculation of various statistical quantities important in the determination of the particle's turbulent motion. By such an analysis three characterizing parameters were found. Two describe inertial effects due to the particle's size and density. They were found to be of prime importance in the determination of the ratio of the particle's fluctuating velocity variance to that of the fluid. The crossing of the particle from one region of correlated fluid turbulence to another by virtue of its free fall velocity is described by the third parameter. This parameter was shown to be of particular importance in limiting the particle's velocity correlation. The two effects, of inertial and of free fall velocity, together act to determine dispersion. A well parameterized particle experiment was undertaken. Analysis of the particles' behavior in the turbulent flow gave a three dimensional characterization of their motion. In particular calculations of velocity variances, autocorrelations, and energy spectra were made. Comparison of theoretical prediction to experimental observation showed good agreement as long as the underlying assumptions inherent in the theoretical derivation were valid. Agreement suffered when these assumptions proved less valid. In particular non-Stokesian drag and anisotropic effects caused disagreement between theory and experiment.

BACTERIOLOGICAL POLLUTION IN THE DRINKING-WATER OF JORDAN,
Ministry of Health, Amman (Jordan). Dept. of Bacteriology.
A. Shehabi.
Environmental Conservation, Vol 3, No 3, p 197-199, Autumn, 1976. 2 tab, 7 ref.

Descriptors: Bacteriology, *Groundwater resources, *Water pollution sources, *Potable water, *Water pollution effects, *Human diseases, Water pollution control, Water pollution, Water resources, Water demand, Available water, Water quality, Sewage disposal, Solid wastes, Industrial wastes, Diseases, Groundwater, Aquifers, Enteric bacteria.
Identifiers: *Jordan.

Many factors contribute to water pollution in Jordan. Among these are the inadequate means of sewage disposal, the obsolete methods employed in the management of solid waste, and the problems associated with industrial activity in high population density areas. Several aspects of bacteriological pollution control in the drinking water of Jordan are discussed. Water samples were collected from several areas of Jordan and analyzed. The results presented indicate that the present pollution-index of Jordan's water supply is significantly high in some regions. This is a major cause for alarm, as the bacteriological pollution of the underground water sources has been found to originate largely from excretal sources. The conclusion is reached that intensive efforts should be launched in order to prevent further pollution of groundwater in Jordan. (Jamail-Arizona)

WATER QUALITY IN THE TEXAS COASTAL BASINS,
Agricultural Research Service, Chickasha, Okla. Southern Great Plains Watershed Research Center.
M. H. Frere, and O. D. Workman.

USDA Publication No ARS-S-163, May 1977. 8 p, 11 fig, 2 tab, 7 ref.

Descriptors: Water analysis, *Water quality, Basins, *Irrigation water, *Nitrates, Land use, Water resources, *Texas, *Gulf coastal plain, Water utilization.
Identifiers: *Texas coastal basins, Gulf coast basin.

Ten years of water-quality records were examined to evaluate the usability of water in the Texas coastal basins, particularly for agriculture, and to determine if agriculture was affecting water quality. Average values of 7 water-quality parameters in 2 periods (1964-69 and 1969-74) were calculated for 23 rivers and basins. The quality of water for agricultural use decreased from the northeast to the southwest. The low quality of water in some basins requires special management for use. Nitrate concentrations were examined in relation to streamflow, seasons, land use, and years. The evidence did not indicate that agricultural activities were seriously degrading the stream water. THE MATHEMATICAL DESCRIPTION OF THE BOD REACTION IN STREAM WATER,
Rutgers - The State Univ., New Brunswick, N. J. Dept. of Environmental Science.
J. P. Hewitt.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-268 529, Price codes: A07 in paper copy, A01 in microfiche. PhD. Thesis, May 1973, 121 p, 13 fig., 19 tab., 59 ref., 3 append. OWRT A-025-N.J.(10). 14-31-0001-3830.

Descriptors: *Biochemical oxygen demand, Kinetics, *Oxygen demand, *Mathematical models, *Regression analysis, Decomposing organic matter, Oxygen sag, Pollutants, Water pollution, Model studies.
Identifiers: *First order kinetics, *Second order kinetics, *Retardation equations, *Simultaneous first order kinetics.

The mathematical description of the Biochemical Oxygen Demand, BOD, for stream water samples is examined. Mathematical expressions which have been offered as alternatives to the first order model are considered for possible application in stream water BOD modelling. All BOD models were fitted to the BOD data using the Gauss-Newton iteration method for solving non-linear regression problems, Biomedical Computing Program BMDX85. The first order model fails to describe adequately the BOD process as evidenced by the poor distribution of residual errors. Other order models, from first to fourth order in steps of 0.5, failed to improve the residual error distribution. The retardation model could not be successfully fitted to stream water BOD data, and where obtained, the distribution of the residual errors was slightly improved as compared to the first order model. A BOD model was proposed of the type $dL/dt = -kL - k'L(1 + t2)$ which on integration produces an equation which in 65% of the cases examined gave significant reductions in residual sum of squares. FOREST FERTILIZATION AND WATER QUALITY IN THE NORTH CAROLINA PIEDMONT,
North Carolina State Univ., Raleigh. School of Forest Resources.
S. G. Sanderford.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-268 621, Price codes: A03 in paper copy, A01 in microfiche. Technical Report No. 53, March 1975. 42 p, 1 fig, 11 tab, 35 ref. OWRT A-085-NC(2), 14-31-0001-5033.

Descriptors: *Fertilization, Water quality, Nutrients, Nitrogen, Phosphorus, Potassium, Drainage, Forest management, *Forest watersheds, Loblolly pine trees, *North Carolina.
Identifiers: *Nutrient losses.

The study was established to determine the effects of N-P-K fertilization on water quality in a forested watershed in the North Carolina Piedmont. A proportional water sampler was used to monitor natural nutrient levels from January 1972 through March 1973. Approximately one-eighth of the watershed was then fertilized (110 kg-N/ha, 24 kg-P/ha, and 47 kg-K/ha) and nutrient monitoring continued through March 1974. Continuous streamflow hydrographs and precipitation records were maintained for the experiment's duration. Comparisons were made between pre and post-treatment nutrient concentrations and losses from the watershed. Only very slight changes in dissolved NO3-N, NH4-N, P, K, Ca, and Mg concentrations were detected following treatment. All concentrations were very low. Kilogram per hectare nutrient losses in the dissolved state were not significantly increased following treatment. Seasonal nutrient level variations, although observed, were slight. It was concluded that forest fertilization had no detrimental effects on water quality. (Stewart-NC State)

FRACTIONATION AND CONTROL OF IRON IN CHANNELIZED AND SWAMP DRAINAGE STREAMS IN NORTH CAROLINA,
East Carolina Univ., Greenville, N.C. Dept. of Biology.
D. S. Vodopich.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-268 625, Price codes: A04 in paper copy, A01 in microfiche. M.S. Thesis, May 1975. 56 p, 5 fig, 8 tab, 35 ref. OWRT A-080-NC(2), 14-31-0001-5033.

Descriptors: *Channel improvement, *Swamps, *Iron, Organic matter, Water quality, *Drainage, Streambeds, Organic carbon, Phosphorus, Heavy metals, Chemical analysis, *North Carolina, Sediment transport, Streams.
Identifiers: *Channelization, *Factionation(Iron), Iron analysis, Organic carbon.

A channelized stream and swamp drainage stream in eastern North Carolina were investigated as to their capacity to transport and fractionate iron. Several water quality parameters were considered with special attention given to organic matter as a control. Between May and September 1974, measurements of dissolved oxygen, pH, temperature, conductivity, flow, organic carbon, and iron, including organically complexed iron, were made and correlated. The two stream systems were found to fractionate and discharge iron differently both qualitatively and quantitatively. The mean total iron concentration of the swamp and channelized streams were 2.06 and 1.46 mg/l respectively. The swamp was consistently higher in both the percentage of total iron dissolved and the percentage of organically complexed iron dissolved. Suspended particulate matter was a major influence on fractionation. The major role of organic matter was the production of a reducing environment rather than a significant binder of iron. (Stewart-NC State)

WATER QUALITY IMPACTS OF URBANIZATION--A METHODOLOGY,
Economic and Social Commission for Asia and the Pacific (UN), Bangkok (Thailand). Div. of Industry, Housing, and Technology.
K. F. Jalal.
Journal of the Environmental Engineering Division-ASCE, Vol. 103, No. EE1, p 49-57, February, 1977. 2 fig, 4 tab, 2 append.

Descriptors: *Model studies, *Urban runoff, Water quality, Design, Planning, Pollutant identification, Cities, Urban areas, Water quality control, Economics.

Identifiers: STORM runoff model.

The STORM (Storage Treatment Overflow Runoff Model) model was used in Canada to investigate the effects of urbanization on water quality. Three steps are involved in the application of the model for this purpose: long-term simulation of runoff quantity and quality for all planning alternatives; comparison of alternatives; and determination of the storage-treatment relationship and the optimum storage-treatment combination for the preferred alternative. Using the model can produce the optimum storage-treatment combinations for meeting a given water quality objective at minimum cost. (Collins-FIRL)

FACTORS AFFECTING THE DENITRIFICATION RATE IN TWO WATER-SEDIMENT SYSTEMS,
Agricultural Univ., Wageningen (Netherlands). Dept. of Microbiology.
J. F. van Kessel.
Water Research, Vol. 11, No. 3, p 259-267, 1977. 9 fig, 4 tab, 32 ref.

Descriptors: *Denitrification, *Temperature, *Dissolved oxygen, Sediments, Evaluation, Analysis, Physical properties, Chemical properties, Activated sludge, Nitrogen, *Nitrates, Sediment-water interfaces.

Two water-sediment systems were studied to analyze denitrification rates, and to determine the effects of temperature, dissolved oxygen, nitrate concentrations in the water above the sediment, and the thickness of the sediment layer on these rates. Sediment A was from the top 10 centimeters of a ditch containing effluent of an activated sludge aeration treatment facility using slurry from meat production calves. Type B was from a similar layer for a ditch containing water drained from arable land. Denitrification was slightly decreased when dissolved oxygen increased from 0 to 2 milligrams/liter in overlying water. Further increases in DO concentrations had no further decreasing effect. Denitrifiction depended on nitrate concentrations in the overlying water when these concentrations were low. It occurred more independently as the nitrate concentrations increased. Denitrification began after an extended lag at 4 C. Denitrification, as well as nitrification, proceeded rapidly at 15 and 25 C. With nitrate-nitrogen concentrations of 25.2 milligrams/liter, a 7 millimeter layer of sediment A and a 14 millimeter layer of sediment B influenced denitrification. Added means of nitrate transport into the sediments were expected to produce lower denitrification rates in natural environments. (Collins-FIRL)

5C. Effects Of Pollution

IMPACT OF TOXIC CLONES OF BLUE-GREEN ALGAE ON WATER QUALITY AS RELATED TO AQUATIC ANIMALS,
New Hampshire Univ., Durham. Dept. of Zoology.
P. J. Sawyer, M. Ikawa, and J. J. Sasner, Jr.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-267 594, Price codes: A03 in paper copy, A01 in microfiche. New Hampshire Water Resources Research Center, Durham, Completion Report, Research Report No. 12, (1977). 35 p, 3 fig, 4 tab, 39 ref. OWRT A-021-NH(5). 14-31-0001-3029.

Descriptors: *Cyanophyta, Anabaena, *Toxicity, Eutrophication, *Algal toxins, Algae, Aquatic algae, North America, Water quality, *New Hampshire, Oxygen, Chromatography, *Biodegradation, Decomposing organic matter, Water pollution effects.
Identifiers: *Anabaena flos-aquae, *Microcystis aeruginosa, *Aphanizomenon flos-aquae, Toxic species, *Oxygen depletion.

The literature indicates that toxic blooms of blue-green algae occur widely. Gorham (1966) cited references describing blue-green algal poisonings from Russia, Argentina, Australia, Morocco, Bermuda, Brazil and Finland. In North America these blooms have been most frequently reported from North Dakota, South Dakota, Minnesota, Iowa, Wisconsin, Illinois, Michigan, Alberta, Saskatchewan, Manitoba and Ontario (Gorham, 1966). Several species of blue-green algae have been associated with these toxic blooms in North America, but the most commonly occuring toxic species are Anabaena flos-aquae, Microcystis, aeruginosa and Aphanizomenon flos-aquae. All three of these occur from time to time in New Hampshire and they occur in both toxic and non-toxic forms. Problems concerning the toxicity of these species occur when heavy concentrations of them decompose naturally. The products of decomposition plus toxic substances from within the cells cause death or illness to many mammals, birds and fishes at that time. Also, associated with the decomposition of large amounts of organic matter, low oxygen concentrations may occur. The combination of toxic substances and low oxygen levels is rapidly fatal to many aquatic organisms. This is the usual manner of toxic manifestations.

EFFECT OF METALS ON PHOTOSYNTHESIS OF MARINE PHYTOPLANKTON, (IN RUSSIAN),
All-Union Research Inst. of Marine Fisheries and Oceanography, Moscow (USSR).
S. A. Patin, and V. N. Tkachenko.
Biol Nauki. 17(5), p 67-69, 1974.

Descriptors: *Photosynthesis, *Mercury, *Copper, Metals, *Phytoplankton, Water pollution effects, *Marine algae, Salts, Nutrients, Seasonal, Primary productivity.
Identifiers: Ditylum-Brightwellii, Gyrodinium-Fissum, Nephrochloris-Salina.

A study of the effect of Hg and Cu salts on 3 spp. of marine unicellular algae (Ditylum brightwellii, Gyrodiniuum fissum, Nephrochloris salina) in culture showed that the rate of C assimiltion drops considerably at concentrations of these salts equal to or less that the maximum allowable concentration (5-10 micro-g/1) in water. The biological after effects of water pollution, at least with respect to primary production, may depend on the level of pollution and on the season The data suggest a greater resistance of unicellular algae to the effect of high concentrations of Hg (10 micro-g/1 and higher) in the presence of an excess of nutrients.--Copyright 1975, Biological Abstracts, Inc.

EFFECTS OF PH AND INORGANIC CARBON CONCENTRATIONS UPON COMPETITION BETWEEN ANABAENA FLOS-AQUAE AND SELENASTRUM CAPRICORNUTUM,
Maine Univ., Orono. Dept. of Civil Engineering.
J. A. Olofsson, Jr., and F. E. Woodard.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-267 720, Price codes: A04 in paper copy, A01 in microfiche. University of Maine Land and Water Resources Institute, Completion Report, April 1977. 55 p, 18 fig, 6 tab, 60 ref. OWRT A-034-ME(1).

Descriptors: Water pollution effects, Water pollution control, Algae, *Anabaena, Competition, Inhibitors, Lakes, Management, *Photosynthesis, Eutrophication, *Hydrogen ion concentration, Carbon, *Cyanophyta, *Chlorophyta, Dominant organisms.
Identifiers: Affinity, Algal bloom initiation, Carbonic anhydrase activity, Diamox, Dominance, Anabaena flos-aquae, Photosynthetic rate, *Selenastrum capricornutum, *Total inorganic carbon.

Relative competitiveness of a selected green alga and blue-green alga was examined in relation to culture pH and total inorganic carbon (CT) in an effort to uncover a mechanism which might be influential in blue-green algal bloom initiation. Short-term growth experiments were conducted employing Anabaena flos-aquae, a bloom forming blue-green alga, and Selnastrum capricornutum, a green alga. A. flos-aquae, at a given level of CT, exhibited increasing photosynthetic rate as pH increased, and reached a maximum in the region of pH 9.5 to 10.0. S. capricornutum, however, exhibited decreasing photosynthetic rates as pH was increased. Photosynthetic rates of A. flos aquae exceeded those of S. capricornutum above pH 7.5, indicating potential pH-related enhancement of blue-green photosynthesis. Carbonic anhydrase was implicated in facilitating photosynthetic rates in A. flos-aquae by using a specific inhibitor of carbonic anhydrase activity. Outside the pH range of 8.35 to 9.0, when the inhibitor Diamox (5-acetamido-1,3,4-thiadiazole-2-sulphonamide) was introduced, significantly reduced photosynthetic rates were observed in A. flos-aquae. It was concluded that A. flos-aquae was a higher affinity for inorganic carbon (as evidenced by photosynthetic rates) than does S. capricornutum due to carbonic anhydrase activity. An overall conclusion is that periodic dominance of the lacustrine phytoplankton by bloom forming blue-green algae may be related to competitive uptake of inorganic carbon facilitated by carbonic anhydrase activity. Facilitated carbon transport in blue-green algae may provide additional insight into the management of blue-green algal blooms in surface water resources.

ORGANOCHLORINE RESIDUES IN NEW ZEALAND BIRDS AND MAMMALS 2. POLYCHLORINATED BIPHENYLS,
Department of Agriculture, Wellington (New Zealand). Wallaceville Animal Research Center.
S. R. B. Solly, and V. Shanks.
New Zealand Journal of Science, Vol. 19, p. 53-55, 1976. 1 tab, 13 ref.

Descriptors: *Polychlorinated biphenyls, *Birds, *Mammals, *Wildlife, *Absorption, Path of pollutants, Foodchains, Mode of Action, Water quality, Toxicity, Analytical techniques, Laboratory tests, Toxins.
Identifiers: *New Zealand, *Bioaccumulation, *Tissue analysis, Kingfisher, Gannet, Giant petrel, Dolphins, Fur seals, Sea-leopard, Halcvon sancta, Sula serrator, Macronectes giganteus, Delphinus delphis, Arctocephalus tersteri, Ogmorhinus leptonyx.

Between September 1966 and July 1973, 627 specimens of wildlife comprising 61 species of birds and 17 species of mammals were analysed for polychlorinated biphenyls. Specimens were colected from the 3 main islands of New Zealand, from the Chatham, Kermadec, and Snares groups of islands, and from Campbell Island and Norfolk Island. Residues were found in 57 specimens comprising 16 species of birds, these were either carnivorous or omnivorous. High individual residues were found in a kingfisher, a gannet, a giant petrel, and in captive dolphins, fur seals, and a sea-leopard. (See also W70-09978) (Katz).

MINERAL CYCLING IN RESERVOIRS,
Oklahoma State Univ., Stillwater. Dept. of Zoology.
D. W. Toetz.
Available from the National Technical Information Service, Springfield, VA 22161 as ORO-425 430, Price codes: A02 in paper copy, A01 in microfiche. Presented at Symposium on Reservoir Resources, November 1974, Durant, Okla. 2 fig., 1 tab., 56 ref. OWRT A-049-OKLA(2), AEC AT-(40-1)-4254.

Descriptors: *Reservoirs, *Cycling nutrients, *Nitrogen, Phosphorus, Limiting factors, Reviews, *Oklahoma.
Identifiers: *Nitrogen sources, *Literature review, Mineral cycling.

A selective litetature review of nitrogen cycling and its impact on studies of eutrophication in Oklahoma reservoirs cites factors involved in quantification of a reservoir nutrient budget. Inputs of biologically-useable nitrogen in the form of precipitation, gas, and by means of biological fixation are discussed, as are nitrogen releases from newly-flooded soils and soils inundated by rising water lvels. The importance of river influents to impoundments as they relate to varous land uses of the drainage basin and seasons is also described. The impacts of groundwater as a nitrogen source, atmospheric precipitation, and biological nitrogen fixation by heterocystous bluegreen algae, some bacteria and fungi are also reviewed. Various nitrogen loss pathways are discussed: sinkage to the sediments, fish catch, aquatic macrophyte removal, groundwater recharge, hypolimnetic withdrawal during stagnation, and biological recycling. Management strategies for reservoirs should be related to models incorporating the major mechanisms affecting the whole system. (Auen-Wisconsin).

Descriptors: Resistance, *Food chains, *Enteric bacteria, *Mercury isolation, Inhibition, *Absorption, Cultures, Trophic level, Rubber, *Pollution abatement, Water pollution control.
Identifiers: *Biotransformation, *Methylmercury, *Enterobacter aerogenes, *Detoxification of Hg2+, Enzyme inhibition, NADH inactivation, Reversal of inhibition, Oxalacetate, 203Hg2+-uptake, Depuration, Biotransference, *Chemisorption by rubber.

Mercury-resistant cultures were isolated from sediments and adapted to resist higher levels of Hg2+. One of these cultures, identified as Enterobacter aerogenes, was able to produce methyl mercury (MM) from HgCl2. It appears that the transformation of Hg2+ to MM is a detoxification process by the bacteria. Mercury not only affected intact bacterial cells but also inhibited their enzymes and many of their metabolites, particularly NSDH, the coenzyme moity of LDH and MDH enzymes. Mercury inactivated NADH but this reaction can be reversed by the addition of oxalacetate. Mercury uptake, concentration and depuration by cells of different trophic levels was affected by the form of mercury, incubation time and temperature and by the age of cells. The rate of transference of 203Hg2+ decreased with trophic levels of food chains. Rubber was an excellent inert agent for effectively removing Hg2+ and is recommended for control of mercury pollution.

MERCURY ACCUMULATION IN TROUT OF SOUTHERN MISSOURI,
Missouri Univ.-Rolla. Dept. of Chemistry.
E. T. Lloyd, W. T. Schrenk, and J. O. Stoffer.
Environmental Research, Vol. 13, p 62-73, 1977. 4 fig, 1 tab, 20 ref. OWRT A-083-MO(2), 14-34-0001-5025.

Descriptors: Mercury, Fish, *Missouri, *Absorption, Trout, Pollutant identification, Analytical techniques, Water pollution effects.
Identifiers: Atomic absorption.

A study of mercury accumulation in trout taken from the trout parks and streams of southern Missouri is presented. Mercury in trout is determined by digestion in nitric acid, sulfuric acid, and potassium permanganate, followed by reduction and aeration for measurement by cold vapor atomic adsorption. The mercury accumulation in the trout ranged from 0.1 to 0.3 ppm of mercury (micro-g of mercury/g of tissue). Previous analysis of trout collected in the mid- to late 1940s from the same areas indicated mercury accumulations of approximately 3 ppm. Over the past 25 years, there appears to be a decrease in mercury found in trout of southern Missouri.

EFFECT OF SOME CHEMICAL ELEMENTS ON THE ACCUMULATION OF CESIUM-137 IN FRESHWATER FISH, (IN RUSSIAN),
Ministerstvo Zdravookhraneniya SSSR, Moscow. Institut Biofiziki.
A. G. Pakulo.
Gig Sanit. 6, p 111-113, 1974.

Descriptors: *Magnesium, *Sodium, *Sulfates, *Bicarbonates, Freshwater fish, *Chlorides, Water pollution effects.
Identifiers: *Cesium-137.

A change of the concentrations of Mg, Na, sulfate and bicarbonate in water does not affect the content of Cs-137 in freshwater fish. On increasing the content of chlorides in water by 10-20-fold the accumulation coefficient of Cs-137 in bones decreases by a factor of 2-3 and in muscles by a factor of 3-4.--Copyright 1975, Biological Abstracts, Inc.

THE PRODUCTIVITY OF FOULING ORGANISM ASSOCIATIONS IN LAKE ZELENETSKOE, (IN RUSSIAN),
Akademiya Nauk SSSR, Leningrad. Zoologicheskii Institut.
A. F. Alimov, and V. N. Nikulina.
Gidrobiol Zh. 10(2), p 29-35, 1974.

Descriptors: Lakes, *Primary productivity, Fouling, Littoral, *Diatoms, Aquatic algae, Diptera, Mayflies, Gastropods, Oligochaetes, Stoneflies, Water pollution.
Identifiers: *Achnanthes-minutissima, *Lake Zelenetskoe(USSR), *Fouling organisms.

In the rocky littoral of Lake Zelenetskoye diatoms are predominant, especially Achnanthes minutissima. The animal fouling organisms are mainly Chironomidae, Plecoptera and Ephemeroptera larvae as well as oligochaetes and gastropods. Algal productivity is close to 0.18.kcal/m2 or 27% of the total phytoplankton production; animal biomass exceeds 1.6-2.3% of the fouling community biomass. No strength in trophic relations was observed between animals of the fouling community. Algae play an important role in primary production in a lake of low productivity.--Copyright 1975, Biological Abstracts, Inc.

A PRODUCTIVITY STUDY OF THE ROANOKE RIVER ABOVE NIAGRA DAM IN VIRGINIA,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Civil Engineering.
J. H. Sherrard, and J. L. Hoyle.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-268 114, Price codes: A04 in paper copy, A01 in microfiche. Virginia Water Resources Research Center, Blacksburg, Bulletin 104, June 1977. 65 p, 21 tab, 12 fig, 43 ref. OWRT B-063-VA(1).

Descriptors: *Eutrophication, Nutrients, *Nitrogen, *Phosphorus, *Virginia, *Bioassay, Sampling, Monitoring, *Pollutant identification, *Productivity, Algae, Anabaena, *Growth rates, Water pollution effects.
Identifiers: *Roanoke River(Va), Selenastrum capriconutum, *Smith Mountain Lake(Va), *Algal assay, *Algal growth potential.

Deterioration of the water quality in the upper end of the Roanoke River of Smith Mountain Lake due to eutrophication has caused much concern. The Smith Mountain Lake impoundment was constructed in 1965 as a pump storage facility to generate electrical energy and has served as a major recreational area for Southwestern Virginia. Eight sampling stations were established along the length of the Roanoke River from an agricultural area in Montgomery County through the urban area of Roanoke Salem to Niagra Dam above Smith Mountain Lake. On 12 occasions, approximately once a month, grab samples were taken at the sampling stations. Samples were analyzed for general parameters and for nitrogen and phosphorus. The Algal Assay Procedure Bottle Test (Environmental Protection Agency, 1971) was conducted with the samples, and in addition, with samples in which phosphorus and/or nitrogen spikes were added to determine potential productivity and to determine which element was limiting productivity. Results demonstrate that the algal assay bottle test is useful in correlating phosphorus concentrations with algal growth rate. Phosphorus was found to limit the algal growth in the Roanoke River above the Roanoke wastewater treatment plant for Selenastrum capricornutum and Anabaena flos-aquae, the two algal species used in this study. Maximum specific growth rates tended to increase with increasing phosphorus concentration.

HYPOPHTHALMICHTHYS MOLITRIX (VAL.)) FOR INCREASING FISH PRODUCTIVITY AND DECREASING THE LEVEL OF EUTROPHICATION OF DNIEPER RESERVOIRS, (IN RUSSIAN),
Akademiya Nauk URSR, Kiev. Instytut Hidrobiologii.
P. S. Vovk.
Vopr Ikhtiol. 14(3), p 406-414, 1974.

Descriptors: Fish reproduction, *Eutrophication, Reservoirs, *Cyanophyta, *Carp, Fish food organisms, Fish diets, Fish, Seston, Anabaena, Toxicity, *Algal toxins, Water pollution effects.
Identifiers: Anabaena-hassalii, Anabaena-scheremetievi, Anabaena-variabilis, Aphanizomenon-flos-aquae, *Hypophthalmichthys-molitrix, Microcystis-aeruginosa, Oscillatoria-agardhii, USSR, *Silver carp, *Dnieper River reservoirs(USSR).

The role is shown of blue-green algae (Aphanizomenon flos-aquae, Oscillatoria agardhii, Anabaena variabilis, A. scheremetievi, A. hassalii, etc., and especially Microcystis aeruginosa) in feeding of the silver carp (Hypophthalmichthys molitrix) and their food significance for other fish species in reservoirs on the Dnieper River (USSR). The problem of the possible effect of toxic excretion of blue-green algae on the silver carp is discussed. It is expedient to stock the silver carp for foraging in the reservoirs in order to increase fish productivity and decrease the level of eutrophication of these water bodies due to the utilization of a considerable part of the seston.--Copyright 1975, Biological Abstracts, Inc.

POPULATION DYNAMICS AND SPECIES DIVERSITY OF ICHTHYO-PARASITOFAUNA OF THE BUFFALO NATIONAL RIVER,
Arkansas Univ., Fayetteville. Dept. of Zoology.
R. V. Kilambi, and D. A. Becker.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-268 235, Price codes: A06 in paper copy, A01 in microfiche. Arkansas Water Resources Research Center, Fayetteville, Publication No. 48, 1977. 85 p, 2 fig., 17 tab., 27 ref. OWRT A-029-ARK(1), CX 700040182.

Descriptors: Worms, Fish diseases, Water pollution effects, Mortality, Copepods, Water quality, *Arkansas, Bass, Sunfishes, *Fish parasites, Growth rates, Seasonal.
Identifiers: *Darters, Bertalanffy growth formula, River pool, Riffle, Seasonal abundance, Gyros, Flukes, *Buffalo National River(Ark).

Monthly fish collections using electro-shocking instruments and seines were made at upstream, midstream, and downstream stations from January 1974 through February 1975 on the Buffalo River, Arkansas. A sharp decrease in smallmouth bass (SMB) marginal scale increment was evident during May for age group 1+. The estimated length weight relationship for SMB was: log W = 3.0 log L - 4.97666 with an average condition factor of 1.1. A Bertalanffy growth formula for describing growth of SMB was Lt = 583 (1 - e 0.14 (t + 0.48). SMB were estimated to attain 95% of the asymptotic length at 21 years and weigh 4.6 lb. Annual mortality rate was lower for SMB of the Buffalo River than other reported U.S. waters. Forty-one species of fish were collected of which the most abundant fishes in pools were the Longear sunfish and the Big eye shiner. The number of fishes collected among pools was significantly different while seasonal abundance was not. The most abundant species in riffles were the Yoke darter and Rainbow darter. Thirty-two species of helminth and copepod parasites were taken from 127 SMB with all fish infected with at least one species. Parasites infecting high percentages of hosts and occurring in large average numbers of parasites per fish were Gyros, Pyloric caecal and intestinal flukes, and the spiny-headed worm. Icthyoparasite mean diversity indicies revealed a rich and diverse fauna with site and seasonal distributions indicative of a complex ecosystem. There were no significant correlations between any parasites and recorded water quality parameters. (Barnes - Arkansas)

REPRODUCTION RATE AND PRODUCTIVITY OF BACTERIA IN THE PONDS OF THE KARAMET-NIYAZ FISHERY FARM, (IN RUSSIAN),
Akademiya Nauk URSR, Kiev. Instytut Hidrobiologii.
O. I. Bogdanovich.
Gidrobiol Zh. 10(2), p 22-28, 1974.

Descriptors: *Bacteria, Ponds, *Fish hatcheries, *Productivity, *Reproduction, Seasonal, Fertilization, Water pollution effects.
Identifiers: Aristichthys-nobilis, Ctenopharyngodon-idella, Hypophthalmichthys-molitrix, *Turkmen-SSR, USSR, Silver carp, Bighead, White amur.

The time of bacterial brood succession was determined for ponds using different fertilizer application patterns in the turkmenian SSR (USSR). Average seasonal fluctuations were 10-30 h in spring, 30-70 h in summer and 20-35 h in autumn. No relation between the reproduction rate and intensification measures applied was found. Daily bacterial productivity and daily P/B (Production/biomass)-coefficient (based on destruction) were calculated. Infertilized ponds the daily bacterial productivity reached 2.57-4.50 mg/1, in unfertilized ponds and in the channel this index was lower 0.2-2.1 mg/1. The daily P/B-coeffiecient was 0.30-3.57. Silver carp (Hypophalmichthys molitrix), bighead (Aristichthys nobilis) and white amur (Ctenopharyngodon idella) are raised in the ponds.--Copyright 1975, Biological Abstracats, Inc.

THE ECOLOGICAL SIGNIFICANCE OF ANTIBIOTIC SUBSTANCES EXCRETED BY ALGAE IN WATERS, (IN POLISH),
Polskie Towarzystwo Przyrodnikow im. Kopernika, Warsaw.
S. Niewolak.
Wszechswiat. 7/8, p 194-196, 1973.

Descriptors: *Ecology, Algae, *Antarctic, *Waterfowl, *Algal toxins, Bacteria, Fungi, Bactericides, Fungicides, Water pollution effects.
Identifiers: *Phaeocystis-pouchetii, *Antibiotic properties(Algae).

Inhibition of microflora development in the alimentary tract of antarctic water fowl during maximal development of Phaeocystis pouchetii suggested that algae might be a source of antibiotics. Consequently, 4 groups of antibiotic substances produced by algae were distinguished. Algae directly or indirectly influenced the density of fish in waters. They were also shown to have bactericidal and fungicidal properties. Antibotic substances produced by algae could be used as a preservative in the fish processing industry. Antibiotic properties of a number of algae are listed in tabular form. --Copyright 1975, Biological Abstracts, Inc.
W77-08463

LONGITUDINAL DISTRIBUTION OF SELECTED MICRONUTRIENTS IN NORTHERN SAN FRANCISCO BAY DURING 1973,
Geological Survey, Menlo Park, Calif. Water Resources Div.
T. J. Conomos, and D. H. Peterson.
In: Proceedings of a Workshop on Algae Nutrient Relationships in the San Francisco Bay and Delta, held at Clear Lake, California, November 8-10, 1973: The San Francisco Bay and Estuarine Association, p 103-126, 1975. 12 fig, 6 tab, 23 ref.

Descriptors: *Aquatic microorganisms, *Phytoplankton, *Nutrients, *Estuarine environment, *Bays, *California, Phosphates, Nitrates, Nitrites, Ammonia, Silicates, Turbidity, Seasonal, Distribution patterns.

Identifiers: *San Francisco Bay estuary, Micronutrients, Seasonal fluctuations.

Investigations in the San Francisco Bay estuary during 1972 indicate that seasonal variations in micronutrient concentrations are associated with seasonal variations in phytoplankton abundances. Micronutrient concentrations are generally lower in summer than winter. During summer the river input of micronutrients to the estuary is high; during winter the converse is generally true. Certain micronutrient distributions tend to be more conservative in winter than summer, suggesting their distributions are dominated by advective and diffusive processes in winter. (Woodard-USGS)
W77-08487

PHYTOPLANKTON PRODUCTION AND ENUMERATION IN NORTHERN SAN FRANCISCO BAY DURING 1972,
Geological Survey, Menlo Park, Calif. Water Resources Div.
E. P. Scrivani.
In: Proceedings of a Workshop on Algae Nutrient Relationships in the San Francisco Bay and Delta, held at Clear Lake, California, November 8-10, 1973: The San Francisco Bay and Estuarine Association, p 127-146, 1975. 4 fig, 2 tab, 46 ref.

Descriptors: *Phytoplankton, *Ecosystems, *Estuarine environment, *Bays, *California, Nutrients, Aquatic microorganisms, Diatoms, Dissolved oxygen, Water chemistry, Photosynthesis, Distribution patterns.
Identifiers: *San Francisco Bay estuary, Phytoplankton productivity.

The phytoplankton and primary productivity of north San Francisco Bay, California, were investigated during hydrographic surveys in 1972. Samples were collected on a near-monthly basis in the main channel of the estuary. A phytoplankton standing stock maxima occurred in the Suisun Bay region. During peak periods, the cell numbers typically exceeded 1500 cells/milliliter and reached a maximum starting in June and continuing through early October. Diatoms were the most abundant phytoplankton in early spring. Primary productivity values correlated with standing stock distributions. Maximum values were obtained during late summer, and suggest that daily waste input is a minor source of nitrogen utilized by phytoplankton. The most productive area appears to be the null zone region of the estuary. In this region, the main channel does not have excessive phytoplankton concentrations that would lead to development of predominantly nuisance species or to serious dissolved oxygen deficiency. (Woodard-USGS)
W77-08488

IMPLICATIONS OF SEASONAL CHEMICAL AND PHYSICAL FACTORS ON THE PRODUCTION OF PHYTOPLANKTON IN NORTHERN SAN FRANCISCO BAY,
Geological Survey, Menlo Park, Calif. Water Resources Div.
D. H. Peterson, and T. J. Conomos.
In: Proceedings of a Workshop on Algae Nutrient Relationships in the San Francisco Bay and Delta, held at Clear Lake, California, November 8-10, 1973: The San Francisco Bay and Estuarine Association, p 147-165, 1975. 4 fig, 3 tab, 56 ref.

Descriptors: *Phytoplankton, *Estuarine environment, *Bays, *California, *Nutrients, Phosphates, Nitrates, Nitrites, Ammonia, Seasonal, Distribution patterns, Chemical properties, Physical properties, Aquatic microorganisms.
Identifiers: *San Francisco Bay estuary, Micronutrients, Seasonal fluctuations.

Northern San Francisco Bay, California, has a single summer-fall peak in phytoplankton cell abundance and productivity. The summer distribution of micronutrients in the main channel is controlled primarily by the distribution of phytoplankton: the highest abundance of phytoplankton persists in the inner regime (null zone) of the estuary and the lowest concentrations of micronutrients occur there. Under present conditions, if summer river discharge decreases and water residence time increases, the phytoplankton population should increase and the dissolved micronutrient concentrations decrease. Nitrogen can be depressed to growth-rate limiting concentrations only during periods of high phytoplankton abundance (during late summer). Increased insolation may increase productivity per unit area in both winter and summer, but increased availbility of nitrogen may increase productivity per unit area only in summer. (Woodard-USGS)

RESPONSE OF OAT AND SPINACH TO SEWAGE SLUDGE APPLICATION IN SOIL,
Rutgers - The State Univ., New Brunswick, N.J. Dept. of Soils and Crops.
S. I. Nahedh.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-268 530, Price codes: A07 in paper copy, A01 in microfiche. M.S. Thesis. September 1975. 141 p, 11 fig, 30 tab, 129 ref, 8 plates. OWRT A-038-NJ(1). 14-31-0001-4030.

Descriptors: *Oats, *Spinach, *Sewage sludge, Salinity, Nitrogen, Phosphorus, Copper, Zinc, Crop response, Hydrogen ion concentration, Salts, Germination, Dissolved solids, Sludge disposal, Growth rates.
Identifiers: *Aerobic sludge *Anaerobic sludge.

A greenhouse study was conducted to determine the effect of sewage sludge amended soils on the growth of oats and spinach. Dissolved salts and pH effected germination and growth. The plants were analyzed for copper, zinc, nitrogen and phosphorus. The results of these experiments in which 0, 20, 40 and 80 T/A of aerobic and anaerobic sludges were used have indicated that spinach responded well to the anaerobic sludge applied to a Freehold sandy loam soil at pH 5 and 7. An increase in the yield over the control was obtained at all anaerobic sludge rates except at the 80 T/A. Application of the aerobic sludge had an adverse effect on spinach yield, particularly when applied to pH 5 soil. The yield increased only after application of 20 T/A to the pH 7 soil. The oats yield increased with the 20 T/A application of the aerobic sludge to pH 5 soil, but the yield decreased drastically with more sludge applications to soils of either pH. The anaerobic sludge increased the yield only at the 40 T/A, then it either leveled off (at pH 5), or decreased (at pH 7) at the 80 T/A rate. The aerobic sludge was more effective in increasing yield than the anaerobic sludge. The aerobic sludge caused more uptake of phosphorus, nitrogen, zinc, copper by oat and spinach than the anaerobic sludge. The results also indicated that the aerobic sludge degraded rapidly in the soil, while the anaerobic sludge was more stable and did not decompose as rapidly.

A PREDICTIVE PHOSPHORUS MODEL FOR LAKES - SENSITIVITY ANALYSIS AND APPLICATIONS,
North Carolina Univ. at Chapel Hill. Dept. of Environmental Sciences and Engineering.
W. J. Snodgrass, and C. R. O'Melia.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-268 607, Price codes: A03 in paper copy, A01 in microfiche. (1975). 29 p, 6 fig, 6 tab, 10 ref. Paper presented at 38th Annual Meeting of American Society of Limnology and Oceanography, June 23-26, 1975, Dalhousie University, Halifax, Nova Scotia, Canada. OWRT A-074-NC(3). 14-31-0001-4033.

Descriptors: Epilimnion, Hypolimnion, *Phosphorus, *Eutrophication, *Model studies, Nutrients, Cycling nutrients, Lakes, Analysis, *Forecasting.
Identifiers: Predictive model for lakes, Sensitivity analysis.

Included are (1) a brief summary of a predictive model for phosphorus in lakes that has been developed and tested, (2) some additional verification of this model, (3) analysis of the sensitivity of model predictions to several model parameters, and (4) conclusions based on this sensitivity analysis. This model introduces two reactions which are usually not considered in limnological investigations. First, a mean-depth dependent exchange of P across the thermocline is developed, based primarily on empirical evidence. Second, natural aggregation or flocculation of particles in lake waters is considered, based primarily on conceptual arguments. The model has been verified in two ways. First, model predictions of the effects of lake depth on eutrophication have been compared with Vollenweider's observations (1968) and gave good agreement. Second, predictions of the total phosphorus concentrations in lakes at the end of the winter circulation (TP) have been compared with field measurements made by other investigators in several lakes. Agreement between predicted and observed results was excellent. (Stewart-NC State)

M. J. Petti.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-268 622, Price codes: A05 in paper copy, A01 in microfiche. M.S. Thesis, 1975. 89 p, 21 fig, 4 tab, 25 ref. OWRT B-052-RI(2). 14-01-0001-4123.

Descriptors: *Phosphorus, *Sediments, Nutrients, Bays, *Rhode Island, *Sediment water interfaces.
Identifiers: *Nutrient flux, *Narragansett Bay(RI).

In developing an understanding of water quality and its management, it is necessary to understand the materials balance or materials flux within a given water system. Among these materials are various pollutants, chemicals, gases, nutrients, biological communities, etc. The interaction of these materials (best described by the rate and extent of reaction) governs the overall aging process of a water system. Such an aging process and the parallel process of eutrophication can proceed naturally or be accelerated artificially. The objective of this study is to investigate an aspect of the

materials balance in Narragansett Bay, Rhode Island. The material of primary concern is phosphorus, and the process under consideration is nutrient flux. Nutrient flux or exchange of phosphorous at the sediment-water interface with the water column above, as determined in the laboratory, of selected bay sediments is described. Two series of experiments were conducted. Each experimental series is composed of microcosm studies performed in the laboratory. The first series studies the release and uptake of phosphorus, to and from the water column, by the sediments in aerobic and anaerobic environments and a constant flushing rate.

THE EFFECT OF SOLUBLE ORGANIC MATTER ON THE UTILIZATION OF PHENOXY HERBICIDES BY PSEUDOMONAS SP.,
Rhode Island Univ., Kingston. Dept. of Microbiology.
C. W. Dimock.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-268 528, Price codes: A04 in paper copy, A01 in microfiche. M. S. Thesis, 1975. 52 p, 11 fig, 9 tab, 21 ref. OWRT A-050-RI(2). 14-31-0001-5040.

Descriptors: Water pollution effects, Pollutant identification, *Pesticides, *Biodegradation, Metabolism, Herbicides, *Pseudomonas, Organic matter, *Microbial degradation, 2-4-D, 2-4-5-T, Organic compounds, Organic acids.
Identifiers: 2-4-5-TP.

Eight organisms of the genus Pseudomonas were isolated from soil and water samples by conventional enrichment techniques. They were used to compare the microbial degradation of the three phenoxy herbicides: 2,4-dichlorophenoxyacetic acid (2,4-D), 2,4,5-trichloro-phenocyacetic acid (2,4,5-T), and 2-(2,4,5-trichlorophenoxy)-propionic acid (2,4,5-TP). 2,4,-D was readily attacked in a mineral salts medium by cultures adapted to this compound. The same concentrations of 2,4,5-T and 2,4,5-TP, however, were attacked only in the presence of a compound such as sodium benzoate, which served as a growth substrate. A comparison of cultures grown on benzoate and an herbicide, and on benzoate alone, showed no difference in cell yield. This suggests that no carbon or energy for growth was obtained from herbicide utilization, which is characteristic of cometabolism. It has previously been reported that the toxic and recalcitrant metabolite, 3,5-dichlorocatechol (3,5-DDC) accumulates during the cometabolism of 2,4,5-T. This might similarly hold true for 2,4,5-TP. The intermediates, 3,5-DCC, and 2,4,5-trichlorophenol (2,4,5-TCP) were not detected in the culture medium during the study, however, it was demonstrated that increasing quantities of bacteriological peptone and beef extract (0.08 mg/ml or o.40 mg/ml) increased the utilization of all three herbicides. This supplement provided only a small increase in growth however in the absence of sodium benzoate, 2,4,5-T and 2,4,5-TP utilization remained equally stimulated, but cell yield was much less. This indicates that the organic matter directly stimulated cell metabolism of the herbicides and did not simply increase growth. Beef extract and peptone contain substances known to be stimulatory to microbial metabolism. When added separately to cultures, these substances produced essentially the same effect. It seems that the 2,4,5-T and 2,4,5-TP were oxidized more extensively than previously reported.

THE LIMNOLOGY OF A NORTH CAROLINA MILLPOND WITH SPECIAL REFERENCE TO HISTORICAL CHANGES AS EVIDENCED BY SEDIMENT CORE ANALYSIS,
North Carolina Univ. at Chapel Hill. Dept. of Environmental Sciences and Engineering.
C. F. Knud-Hansen.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-268 624, Price codes: A05 in paper copy, A01 in microfiche. M.S. Thesis, 1975. 67 p, 10 fig, 7 tab, 61 ref, 4 append. OWRT A-078-NC(1), 14-31-0001-5033.

Descriptors: *Eutrophication, Nutrients, Nitrates, Phosphates, *Tropic level, *Limnology, Water quality, Surface waters, Aquatic algae, Diatoms, *North Carolina, *Oligotrophy, Water pollution effects, Lake sediments.
Identifiers: *Silver Lake(NC).

Silver Lake, built in 1785 in the Coastal Plain of North Carolina to run a corn mill, was found in 1974 to A moderately oligotrophic with respect to physical, chemical and biological parameters. Primarily due to a 623:1 drainage area to lake surface area ratio (75.1 square miles:77 acres), the calculated nutrient loading rates are 373.5 g N/m2/yr and 12.5 g P/m2/yr. These very high rates do not lead to eutrophic conditions presumbly because of an average detention time of 2.4 days, and little accumulation or retention of nutrients in this shallow (mean depth of 5.1 feet or 1.9 m) lake. Silver Lake was phosphorus limited as evidenced by the ratio of nitrogen to phosphorus loading as well as by the results of algal assay. A 13 cm lake sediment core was analyzed for oxidizable carbon, dry weight and diatom community structure at each centimeter of depth. A linear regression of the relationship between percent oxidizable carbon and number of diatoms per gram dry weight resulted in a negative correlation coefficient of 0.66. The dominant genera of diatoms shifted twice during the history of the lake. (Stewart-NC State)

PERSISTENCE OF MYCOBACTERIUM BOVIS BCG IN SOIL AND ON VEGETABLES SPRAY-IRRIGATED WITH SEWAGE EFFLUENT AND SLUDGE,
Public Health Service, Cincinnati, Ohio. Div. of Microbiology.
D. J. Van Donsel, and E. P. Larkin.
Journal of Food Protection, Vol. 40, No. 3, p 160-163, March, 1977. 3 fig, 1 tab, 20 ref.

Descriptors: Irrigation, *Sludge disposal, *Sewage effluents, Soil contamination effects, Microorganisms, Vegetation, Municipal wastes, Analysis, Waste water treatment, Public health.
Identifiers: *Mycobacterium bovis BCG.

Land disposal of sludge is currently under consideration in the United States, and studies are being conducted on the potential public health hazards which might be inherent in this practice. Tubercle bacilli represent a particular threat because they generally survive conventional waste water treatment processes. Cultured Mycobacterium bovis BCG was added to activated sludge and to unchlorinated secondary effluent, which was then sprayed onto lettuce or radish plants grown outdoors in plywood boxes. Soil suspensions and vegetable washings were assayed for BCG. The 90% reduction time on effluent-sprayed radishes was 6 days, and on sludge-sprayed radishes it was 4 days, which was not a significant difference. The results for lettuce was too variable to permit estimation of survival rates. Consistent, low-level isolation of the organisms indicated that a certain amount had become attached to the plants. Washout of the inoculum from the plots by rainfall was apparently minimal. Soil temperatures were high during the test period, and heat probably killed many of the mycobacteria. The results must be interpreted with caution in view of the known large differences between mycobacterium grown in vitro and in vivo, and because of the numbers of tubercle bacilli found in urban sewage are very difficult to estimate. RECLAMATION OF ANTHRACITE COAL REFUSE USING TREATED MUNICIPAL WASTEWATER AND SLUDGE,
Pennsylvania State Univ., University Park. School of Forest Resources.
W. E. Sopper, L. T. Kardos, and L. E. DiLissio.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-267 666, Price codes: A06 in paper copy, A01 in microfiche. Research Publication 94, Institute for Research on Land and Water Resources, University Park, December 1976. 95 p, 62 tab, 21 fig, 74 ref, append. OWRT B-069-PA(5). 14-31-0001-4038.

Descriptors: *Sewage effluents, *Sewage disposal, *Revegetation, *Sewage sludge, Municipal wastes, Calcium, Phosphorus, Nitrogen, Legumes, *Grasses, Trees, *Pennsylvania, Water reuse, Vegetation effects, Waste disposal, Coal mine wastes, Recycling.
Identifiers: *Liquid digested sludge, *Anthracite mining refuse, Tension lysimeters, Ground cover.

The study determined the feasibility of using municipal sewage effluent and liquid digested sludge to facilitate the revegetation of anthracite mining refuse. Four boxes, 4 x 32 x 4 feet deep, were

filled with anthracite coal refuse from a mining operation. The refuse was planted with eight species of trees, and seeded with eight species of both grasses and legumes. The boxes were then treated with sewage effluent and liquid digested sludge. Weekly percolate samples were collected at the 6 inch and 42 inch refuse depths with tension lysimeters. Treatments were applied for 19 weeks. Most tree species showed a significant response to treatment. The application of sludge appears to be necessary for successful establishment of a dense ground cover. Maximum grass and legume dry matter productions and percent areal covers were observed. Chemical analyses of the grasses revealed an increase in the content of nitrogen, phosphorus and calcium with each increase in fertilizer value of treatment. Application of treated domestic sewage increased the pH of the coal refuse at each level of treatment. Results indicate that revegetation of anthracite coal refuse is possible through the application of treated municipal wastewater. (Sink-Penn State)

INVOLVEMENT OF FREE RADICALS IN THE CATALYTIC OXIDATION OF PHENOL IN AQUEOUS SOLUTION,
Delaware Univ., Newark. Dept. of Chemical Engineering.
A. J. Sadana.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-267 810, Price codes: A10 in paper copy, A01 in microfiche. Ph.D. Thesis, June 1975. 194 p, 27 fig, 8 tab, 83 ref, 3 append. OWRT A-014-DEL(11).

Descriptors: Oxidation, *Catalysts, *Chemical reaction, *Phenol, *Kinetics, *Industrial wastes, Wastewater treatment, Ultimate disposal, Chemical wastes.
Identifiers: *Aqueous-Phase Oxidation, *Wet Air Oxidation, *Catalytic oxidation, Free Radicals.

Aquueous-phase atalytic oxidation of phenol over supported copper oxide was studied from 369 to 452 degrees K and 14.7 to 250 psig oxygen pressure in batchwise mode. The reaction involves an induction period and a steady-state activity regime. The initial rate is first order in phenol and one-half order in oxygen. Free radical involvement in the heterogeneously catalyzed oxidation of phenol was established. Reaction networks are similar for the heterogeneously and homogeneously catalyzed oxidation of phenol as far as quinones. Intermediates such as organic acids, which are observed in homogeneous oxidation, were not observed in the heterogeneouusly catalyzed oxidation. Aqueous-phase heterogeneously catalyzed oxidation removes organic carbon, initially charged as phenol, from solution efficiently at moderate temperatures and pressures. The less severe conditions required for aqueouus-phase catalytic oxidation of organics make it appear much more economical than non-catalyzed wet air oxidation. (Katzer-Delaware)

SPRAY IRRIGATION OF TREATED MUNICIPAL SEWAGE EFFLUENT AND ITS EFFECT ON CHEMICAL PROPERTIES OF FOREST SOIL,
Pennsylvania State Univ., University Park. Inst. for Research on Land and Water Resources.
J. L. Richenderfer, W. E. Sopper, and L. T. Kardos.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-267 808, Price codes: A03 in paper copy, A01 in microfiche. USDA Forest Service General Technical Report NE-17, 1975. 24 p. 18 tab., 17 fig., 10 ref., append. OWRT C-5169(no. 4205)(1), B-001-PA (10), B-020-PA (15), B-047-PA (5), B-069-PA (2), and B-083-PA (1). 14-31-001-4205.

Descriptors: *Sewage effluents, *Forest soils, *Drainage water, Phosphorus, Boron, Manganese, Sodium, Potassium, Chemical properties, Sewage disposal, Waste disposal, Waste water disposal, Water reuse.
Identifiers: *Spray irrigation, *Land disposal, *Land irrigation, *Sewage effluent disposal, Soil samples, Exchangeable hydrogen.

The Waste Water Renovation and Conservation Project at The Pennsylvania State University was begun to determine the feasibility and effectiveness of land irrigation as a method of municipal sewage effluent disposal. Irrigation was begun in 1963 on an old-field area, hardwood stand, and a red pine plantation on Hublersburg silt loam soil. In 1965, irrigation was begun in a hardwood stand located on Morrison sand loam soil on State Game Lands. Soil samples were collected in the fall of 1963, 1967, and 1971. The samples were taken with a Veihmeyer tube by 1-foot depth increments to 5 feet. Of the 11 constituents analyzed, only potassium, sodium, manganese, exchangeable hydrogen, boron, and phosphorus had significant changes in concentration over time. Potassium, manganese, exchangeable hydrogen, and boron decreased significantly over time while sodium and phosphorus increased significantly over time. After 9 years of spray irrigation with treated municipal wastewater, there were no indications that the treatment had any detrimental effects on the soil. (Sink-Penn State)

MATHEMATICAL AND EXPERIMENTAL INVESTIGATION OF NONSTEADY STATE THICKENING OF AN IDEAL SLURRY,
Delaware Univ., Newark, Dept. of Civil Engineering.
J. B. McVaugh, Jr.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-267 799, Price codes: A08 in paper copy, A01 in microfiche. M.S. Thesis, May 1975. 157 p, 33 fig, 7 tab, 47 ref, 4 append. OWRT A-025-DEL(3).

Descriptors: Sedimentation, *Sludge, *Sludge treatment, *Settling basins, *Laboratory tests, *Wastewater treatment, *Slurries, Water pollution control, Design, Suspensions, Sludge disposal, Separation techniques, Calcium carbonate, *Mathematical models.
Identifiers: *Thickening.

The purpose was to develop a mathematical model which could be used to describe non-steady state sludge thickening in a sedimentation tank or thickener in which zone settling takes place. The model was used in calculating such parameters as sludge bed depth and solids concentrations in thickener overflow and underflow, and was based on hypothetical overloading and underloading transients imposed on a continuous thickener settling a plastic bead slurry and a CaCo3 slurry. The model qualitatively described the behavior of the parameters when compared to the behavior predicted by solids flux theory. To test the validity of the model, a laboratory scale continuous thickener was constructed to settle a slurry of laboratory grade CaCo3. The thickener consisted of a plexiglass column 13.97 cm I.D. by approximately 265 cm height, with appropriate pumps and accessories to conduct batch and continuous thickening experiments. YEAR ROUND COOLING WATER FROM THE COLD WEATHER OF WINTER,
J. C. St. Clair.
U.S. Patent No. 3,997,112, 5 p, 1 fig, 12 ref; Official Gazette of the United States Patent Office, Vol 953, no 2, p 618, December 14, 1976.

Descriptors: *Patents, *Cooling water, *Industrial water, *Irrigation, Irrigation water, Water pollution sources, Reservoirs, Irrigation practices, Water reuse.

Cooling water at 39 deg. F is made available at low cost all year round by erecting towers in farmer's fields and spraying the water in the air around the towers to cool the water during the winter. The cooled water is collected and stored in a lake. During the summer the same towers and water spraying system is used to act as a permanent irrigation system with the water from the lake sprayed when needed on the farmer's crops. Since the use of the cold water from the lake for cooling water have to and can easily afford to pay for the whole system which includes a very good drainage system, farmers will greatly profit and therefore greatly favor the installation of such a system on their farms. With such a system the installers and owners of such a system can put polluting substances, in the irrigation water, that normally cannot be dumped in rivers, and the farmer's fields will act as a costless area where bacteria break down most polluting substances such as most industrial chemicals and sewage liquids. Electric lights can be installed on the towers and the farmers fields can be illuminated during the night and the crop yields increased by 10 to 25%. (Sinha-OEIS)

METHOD OF PURIFICATION OF WASTE WATER BY TREATMENT WITH ZIRCONIUM SALT,
Shikoku Paper Mfg. Co. Ltd. (Japan). (Assignee).
B. Ayukawa.
U.S. Patent No. 3,997,439, 11 p, 5 ref; Official Gazette of the United States Patent Office, Vol 953, no 2, p 718, December 14, 1976.

Descriptors: *Patents, *Waste water treatment, *Industrial wastes, *Pulp wastes, *Water purification, Coagulation, Suspended solids, Chemical precipitation, Separation techniques, Pulp and paper industry.
Identifiers: *Zirconium salts.

This invention relates to a method for purification of water in which soluble octavalent polymer cation forming water soluble zirconium salts are used to coagulate and precipitate suspended substances and colloidal dispersed particles as well as non-colloidal dissolved organic and inorganic substances in waste water. The object of the invention resides in complete removal of suspended substances and colloidal dispersed particles as well as complete or partial removal of non-colloidal dissolved low molecular organic substances in the waste water derived from chemical pulping and paper mills so that oxygen demand and color are minimized and transparency is maximized in one process. (Sinha-OEIS)

THE EFFECT OF DIFFERENT FLOCCULANTS ON THE ELIMINATION OF TRACE ELEMENTS AND POLYCYLIC HYDROCARBONS IN THE WATER PURIFICATION PROCESS, (IN GERMAN),
Mainz Univ. (West Germany). Hygiene Institut.
H. Kunte, J. K. Reichert, and J. Borneff.
Zentralbl Bakteriol Parasitenkd Infektionskr Hyg Erste Abt Orig Reihe B Hyg Praev Med. 158(6), p 530-540, 1974.

Descriptors: *Trace elements, Flocculation, Organic compounds, Water purification, *Waste water treatment, *Metals, Filtration, Pilot plants.
Identifiers: Trace metals, Metaloids, *Rhine River(Germany).

Water from the river Rhine was purified in a refiltration flocculator (pilot plant) using ferric chloride (30-36 g/m3), aluminum sulfate (70-100 g/m3), and 'ferri-Floc' (60-90 g/m3) as flocculants, the latter being a commercial product manufactured from residues of bauxite processing. The 3 substances, used at an optimal dosage, were equally efficient for reduction in turbidity, KMnO4 value, and concentrations of metals-metaloids. The elimination rate for the total of the 4 carcinogenic hydrocarbons 3,4-benzypyrene, 3,4-benzfluoranthene, 11,12-benzfluoranthene and indeno (1,2,3-cd) pyrene was 71-73% with ferric chloride, 80-87% with aluminum sulfate and 77-88% with 'ferri-Floc.' The most active carcinogen, 3,4-benzpyrene, was reduced by 90%. In all cases the concentrations after flocculation corresponded to values normally found in the ground water. Trace metals and metaloids were not affected in the same way. Only Ar, Hg, Fe, Mo and V were reduced in the majority of experiments. Cd, Cr, Co, Cu, Li, Ni, Pb, Se, Sr and Zn behaved differently. Since the raw water values were rather low, these results can not be regarded as a failure of the flocculation process. At such low concentrations these elements probably can not be removed by any kind of flocculation, a complete removal is not even desirable because many have a biological function in the body.--Copyright 1975, Biological Abstract, Inc.

KRAFT MILL RECOVERY SYSTEM,
Hooker Chemicals and Plastics Corp., Niagara Falls, N.Y. (Assignee).
W. A. Fuller.
U.S. Patent No. 3,996,097, 3 p, 9 ref; Official Gazette of the United States Patent Office, Vol 953, no 1, p 271, December 7, 1976.

Descriptors: *Patents, *Waste water treatment, *Industrial wastes, *Pulp and paper industry, Bleaching wastes, *Water reuse, Sodium chloride, Salts, Sodium compounds, Separation techniques, *Recycling.

During pulping operations, sodium chloride is dissolved in the pulping liquor and tends to remain in the chemical recovery cycle. Kraft pulping mills located in the interior or those supplied with logs which have not been salt water transported do not generally face this problem now; however, in the future, reuse of water to limit discharge of pollutants from a kraft mill may results in a significant buildup of sodium chloride in the recovery system. A precipitator catch containing sodium sulfate, sodium carbonate, sodium chloride and organic materials is removed from the precipitator to a slurry tank where sufficient water is added to produce a readily flowable or pumpable aqueous slurry. Carbon dioxide in an amount sufficient to convert the sodium carbonate to the less soluble bicarbonate is fed to the slurry by any suitable means, such as sparging, and the resultant slurry containing sodium sulfate, sodium chloride, sodium bicarbonate and organic materials which slurry is directed to a suitable filter and filtered to produce a filter cake containing essentially sodium sulfate and sodium bicarbonate, and a filtrate containing essentially sodium chloride. The filtrate is then removed from the system. (Sinha-OEIS)
W77-08258

PRECOAT FOR PERMEABILITY SEPARATION SYSTEMS,
Universal Oil Products Co., Des Plaines, Ill. (Assignee).
W. M. Conn.
U.S. Patent No. 3,996,131, 5 p, 4 tab, 8 ref; Official Gazette of the United States Patent Office, Vol 953, no 1, p 282, December 7, 1976.

Descriptors: *Patents, *Waste water treatment, *Water pollution treatment, *Separation techniques, Reverse osmosis, Membrane processes, Absorption, Clays, Activated carbon, Permeability.
Identifiers: Ultrafiltration processes.

The use of ultrafiltration and reverse osmosis for the separation or concentration of materials which include compositions such as greasy materials has been greatly restricted or entirely avoided. A system and composition which ensures the satisfactory operation of a reverse osmosis or ultrafiltration permanent membrane and system by effectively removing the hydrophobic and greasy materials before they can reach the membrane surface is disclosed. A composition comprising a clay or silicious absorbent or similar materials and activated carbon may be laid upon the membrane surface smoothly and evenly through the use of a normal pressure (i.e. up to 800 psi or more) and flow through-out the reverse osmosis or ultrafiltration system. Once deposited upon the membrane surface the composition will intercept the large large hydrophobic and undesirable molecules by absorption on the clay. Oily and other organic molecules, including dissolved materials likely to foul the membrane, will be adsorbed on the activated carbon. When the precoat layer is filled to capacity it is necessary to remove the precoat by flushing it. For the flushing procedure, the pressure is generally reduced and the velocity or flow rate of water being passed through the system is increased. It is helpful to follow the flushing step with a cleaning step by using a small amount of conventional laundry detergent which will remove much of the material which may have adhered to the membrane. (Sinha-OEIS)

LIQUID WASTE TREATMENT APPARATUS,
J. E. Prince, F. E. Terry, and W. H. Mullins.
U.S. Patent No. 3,996,139, 4 p, 3 fig, 12 ref; Official Gazette of the United States Patent Office, Vol 953, no 1, p 284, December 7, 1976.

Descriptors: *Patents, *Waste water treatment, *Water treatment, *Water pollution treatment, Water quality control, *Aeration, Oxygenation, Industrial wastes, Farm wastes, Equipment.

A self-contained extraction, aeration and return unit capable of intrusion into existing liquid circuits is provided. The unit can intrude either as a supplementing step, such as for boosting aeration rates in existing aerating vessels, or as a preliminary step either immediately before the remaining treatment steps or at a geographically remote point which permits action of the oxygen in the waste liquid while enroute to a treatment plant. The invention is not limited to use in the treatment of sewage but has application in any liquid circuit where aeration is required such as reducing mineral content of potable water and aquaculture applications. In addition to its use as an oxygenating aerator, the unit or the preferred form of the aspirating aerator may be employed to infuse relatively cooler air into warm or hot waste liquid and thereby reduce the temperature of waste liquid. The unit includes an aspirator having an elongate mixing chamber downstream of the aspiration point and a liquid pump. (Sinha-OEIS)

SOURCES, CHARACTERISTICS AND TREATMENT AND DISPOSAL OF INDUSTRIAL WASTES CONTAINING HEXACHLOROBENZENE,
TRW Systems and Energy, Redondo Beach, Calif.
S. C. Quinlivan, M. Ghassemi, and T. V. Leshendok.
Journal of Hazardous Materials, Vol. 1, No. 4, p 343-359, March, 1977. 1 fig, 9 tab, 11 ref.

Descriptors: *Chemical wastes, *Pesticides, *Toxicity, Industrial wastes, Solvents, Pesticide residues, Food chains, *Waste water disposal, *Waste water treatment, Environmental effects, Landfills, Incineration.
Identifiers: *Hexachlorobenzene.

Hexachlorobenzene (HCB) is a hazardous contaminant found in certain industrial wastes. It is toxic, has a potential for bioaccumulation in the food chain, and is stable physically, chemically, and biologically, enabling it to persist environmentally. The toxic effect of this chemical is chronic rather than acute, appearing most conspicuously as liver dysfunction. Serious incidents of environmental contamination have resulted from the mismanagement of wastes and products containing HCB. A study was therefore conducted to provide information on the major sources of wastes containing HCB, on the treatment and disposal methods used for these wastes, and on the cost of treatment and disposal. Of the 14 industry types identified as HCB producers, the pesticide and chlorinated solvents industries accounted for almost all HCB wastes, which amount to an estimated 4,305 tons per year. In producing Dacthal, PCNB, mirex, simazine, atrazine from chlorinated solvent production. The wastes are variously transported by forklift, truck, pipeline, heated tank trucks and rail. Prior to ultimate disposal they are stored as solid waste cubes under plastic cover and in water-covered lagoons. The disposal methods include land disposal, incineration, resource recovery, municipal sewage treatment, and atmospheric emission. Land disposal is the most prevalent method and can be environmentally acceptable with adequate soil covers of 4 to 6 feet, intermediate plastic layers to reduce the sublimation rate, and a sound geological site capable of containing leachates. Incineration with controlled emission, and by-product recovery appear to be the most desirable methods for destroying these wastes. Disposal cost data were not available. (Kutcher-FIRL)

REMOVING EXPLOSIVES FROM WASTEWATER,
College of Petroleum and Minerals, Dhahran (Saudi Arabia).

R. K. Andren, R. McDonnell, B. Stevens, and J. M. Nystrom.
Industrial Wastes, Vol. 23, No. 2, p 28-31, 49, March/April, 1977. 8 fig, 1 tab, 6 ref.

Descriptors: *Explosives, *Organic compounds, *Polymers, *Adsorption, Chemical wastes, Industrial wastes, Pilot plants, Toxicity, Activated carbon, Organic wastes, Waste disposal, *Waste water treatment.
Identifiers: Nitrobodies, RDX, HMX, Trinitrotoluene, Dinitrotoluene.

Pilot plant studies were run at the Iowa Ammunition Plant, Burlington, to establish the effectiveness of using a continuous polymeric adsorption process for removing trinitrotoluene (TNT), dinitrotoluene (DNT), and other hazardous nitrobodies, such as cyclotrimethylenetrinitramine (RDX) and cyclotrimethylenetetranitramine (HMX), from the waste streams of explosives production plants. These wastes contain highly colored, toxic, and explosive elements. Treatment methods employing neutralization, settling, dilution, and biological treatment are problematic or ineffective. Activated carbon adsorption will remove many organic materials, but its use for nitroaromatics is limited, as is its capacity for restoration. The polymeric adsorbent studied, Amberlite XAD-4, is composed of hard, non-porous resin beads resembling ion exchange resins but lacking ionic groups. This adsorbent can be regenerated for many cycles of operation and has a superior capacity for aromatic nitrobodies, although it is less effective for the non-aromatic RDX. The treatment process suggested would utilize too parallel polymeric adsorption columns in a one-on, one-off mode. Two smaller polishing columns would be similarly operated. Recoverable solvent will regenerate the loaded adsorbent, leaving a concentrated aqueous sludge of explosive contaminants for ultimate disposal. This process would not remove all color, however; using the polymeric adsorbent and activated carbon as polishers in series would do so. The regenerated resin would remove residual RDX. The advantages of this treatment method are low chemical costs and substantially reduced solid waste disposal problems and hazards. (Kutcher-FIRL)
W77-08266

OZONE EFFECT OF SYNTHETIC RUBBER WASTE TREATMENT,
University of Southern California, Los Angeles. Environmental Engineering Div.
K. Y. Chen, and R. W. Okey.
Industrial Wastes, Vol. 23, No. 2, p 46-48, March/April, 1977. 5 fig, 2 tab, 3 ref.

Descriptors: *Ozone, *Organic compounds, Industrial wastes, Chemical oxygen demand, Rubber, Pilot plants, *Waste water treatment.

Tests were conducted on the use of ozone for treatment of wastes from synthetic rubber production in order to provide data for a 10 gpm pilot plant which was later designed, constructed, and operated on site. The possibility of using ozone was investigated due to the continued fouling of a water recovery evaporator employed after alum coagulation and sedimentation in the production of high quality process water. Experiments were performed and the results reported on the relationship between COD versus time in the ozonation of rubber and tire waste water at different standard cubic feet per hour bubbling rates. It was demonstrated that ozone treated effluents exerted substantial influence on oxygen uptake, as compared to untreated effluent. This suggests that ozonation of persistent organic compounds followed by conventional biological treatment may be a solution to the problem of treatment of many non-biodegradable organic compounds. The ozone reaction was found to be best carried out in the middle pH range of 6.0 to 8.5, sometimes necessitating a buffer system to maintain this pH level. (Kramer-FIRL)
W77-08267

WASTE IMPOUNDMENT EFFICIENCY AT SUGAR MILL,
K. M. St. PE.
Sugar Journal, Vol. 39, No. 11, p 25-26, April, 1977. 1 tab.

Descriptors: *Biological treatment, *Carbohydrates, *Organic wastes, *Food processing industry, Aerobic treatment, Anaerobic conditions, Lagoons, Biochemical oxygen demand, Dissolved oxygen, Industrial wastes, *Waste water treatment, Oxygenation, *Oxidation lagoons.
Identifiers: *Sugar mill wastes.

Sugar mill impoundment waters occasionally exhibit a low BOD5 of less than 10 parts per million along with an absence or small quantity of dissolved oxygen, ranging from 0.0 to 1.0 ppm. This phenomenon occurs in impoundments where sunlight penetration is restricted by heavy vegetative growths. The bacterial action necessary for organic waste decomposition is explained, and the efficiency differences are illustrated for impoundments receiving direct sunlight and for those which do not. Sugar can be decomposed by anaerobic and aerobic bacteria. In ponds with high organic waste loads, anaerobic bacteria are used for the initial decomposition, but for discharge into state waters, a final aerobic stage is necessary. This requires free or dissolved oxygen, often obtained by mechanical aeration. Phytoplankton may also be used, at less expense to large mill impoundments than mechanical aeration. The phytoplankton need sunlight to produce oxygen photosynthetically. Where sunlight is not available the impoundment wastes remain unoxygenated, anaerobic bacterial growth is encouraged, the effluent has a low BOD5, and contains little oxygen. The results from tests with two ponds differing in sunlight and vegetation showed that the pond without vegetative-sunlight restrictions produced completely stabilized, well-oxygenated wastes, whereas the other one was less efficient in producing a high quality effluent. (Kutcher-FIRL)
W77-08268

BACTERIOLOGICAL INVESTIGATION OF ALBERTA MEAT-PACKING PLANT WASTES WITH EMPHASIS ON SALMONELLA ISOLATION,
Environmental Protection Service, Edmonton (Alberta). Microbiology Lab.
J. M. Vanderpost, and J. B. Bell.
Applied and Environmental Microbiology, Vol. 33, No. 3, p 538-545, March, 1977. 1 fig, 8 tab, 22 ref.

Descriptors: *Bacteria, *Food processing industry, *Disinfection, *Salmonella, Municipal wastes, *Industrial wastes, *Waste water treatment, Treatment facilities, Membrane processes, Public health, *Isolation, *Canada, Bioindicators.
Identifiers: *Meat packing plant wastes.

Eleven meat-packing plants in Alberta, Canada, were investigated to assess the occurrence and numbers of indicator bacteria and of Salmonella in their treatment facilities and final effluents. The purpose of the study was to help establish guidelines and standards for these effluents, and to determine whether disinfection is necessary. Municipal sewage in Alberta does not ordinarily undergo disinfection, so that organisms eventually are released to rivers. Washwater and manure are the sources of Salmonella in these plants. The effluent samples were tested by Standard Methods membrane filtration procedures. Results showed that the bacteriological quality of final effluents was very poor, resembling raw sewage in the numbers of indicator organisms, ranging from the hundreds of thousands to millions per milliliter. Primary treatment using settling and flotation was ineffective in reducing the number of bacteria. While secondary treatment reduced the bacteria by 99%, it could not be clearly determined that this treatment had much influence on Salmonella reduction. Salmonella were found in the final effluents of 78% of the plants, including the one using secondary treatment. The 21 Salmonella serotypes isolated did not resist antibiotics. Some of the coliform and fecal coliform isolates were resistant to the antibiotics chloramphenicol, tetracycline, and ampicillin. There is a concern that this resistance might be transferred to Salmonella. Disinfection of the wastes could prevent this potential health hazard. (Kutcher-FIRL)
W77-08269

OCCUPATIONAL CHARACTERISTICS AND BIOLOGICAL KINETIC CONSTANTS OF EXTENDED AERATION PROCESS,
Asian Inst. of Tech., Bangkok (Thailand).
P. Y. Yang, and Y. K. Chen.
Journal Water Pollution Control Federation, Vol. 49, No. 4, p 678-688, April, 1977. 12 fig, 6 tab, 14 ref.

Descriptors: *Kinetics, *Aeration, *Waste water treatment, *Food processing industry, Activated sludge, Organic compounds, Chemical oxygen demand, Biological treatment.
Identifiers: *Extended aeration.

A study is presented of investigations into the performance of a continuous-flow extended aeration system meant to treat soluble organic waste water from soft drink bottling plants. The aeration systems were tested with and without the assistance of partial chemical hydrolysis for sludge recycling. In both cases, the biological kinetic constants evaluated were the yield constant, the specific organism decay rate, the saturation concentration, and the maximum growth rate. With hydrolysis, a 75% reduction in sludge production was obtained; the maximum growth rate decreased 64.5%, and the specific organism decay rate decreased 65.6%. Several wastes from different soft drinks and from milk were used to evaluate these constants. It appears that the type of organic waste rather than the substrate concentration is most important in varying the constants. It was concluded that if the average biochemical removal efficiency, in terms of COD, is greater than 96.2%, soluble organic effluents can be treated by the extended aeration activated sludge processes, with total sludge recycling. Using acid hydrolysis is in this instance irrelevant. Acid hydrolysis applied to a portion of the return sludge can maintain the biological solids concentration within a certain range. It can also produce a nitrified effluent which will enhance the endogenous oxygen uptake rate and the specific substrate utilization rate of the sludge. (Kutcher-FIRL)
W77-08270

CLOSED-LOOP SYSTEM SEPARATES OIL FROM PREWASH OVERFLOW,
Miller Brewing Co., Milwaukee, Wis.
D. Erwin.
Industrial Wastes, Vol. 23, No. 2, p 26-27, 50, March/April, 1977. 1 fig.

Descriptors: *Oil wastes, *Metals, *Aluminum, Industrial wastes, *Waste water treatment, *Recycling, Water reuse.
Identifiers: Closed-loop systems, *Brewery canning wastes.

A closed-loop system is described which separates oil from the prewash rinse water of the aluminum can finishing process at the Miller Brewing Company. The prewash stage generates up to 50% of the waste overflows; 90% of the oil can be removed by this closed system which also provides for the recirculation of water. A water electrolyte solution is sprayed onto the cans to break down the oil emulsion with which they are coated. The oil-laden overflow is passed into a cylindrical tank with a truncated top. The oil is then directed to a top-mounted recovery belt from which the oil is scraped; it is next discharged to a holding tank

for reclamation. The rinse water, now free of oil, is returned to the prewash stage. The tank can be periodically purged of dirt, solids, and electrolyte accumulations. Blowdowns of 100 to 200 gpd are adequate to keep the loop clean. The system is controlled automatically to maintain the desired two percent electrolyte concentration, and to assure an oil/water interface variation in the separation tank of not more than one half inch. This keeps the water below the oil removal belt and the oil level high enough for optimum contact with the belt. The advantages of this system are reduced water and chemical consumption, and the recovery of oil for reuse or sale. (Kutcher-FIRL)

Bulletin of Environmental Contamination and Toxicology, Vol. 17, No. 3, p 355-359, March, 1977. 1 fig, 2 tab, 11 ref.

Descriptors: *Organic compounds, *Waste water treatment, *Adsorption, Bacteria, Municipal wastes, Industrial wastes, *Mercury, *Copper, *Nickel, *Cadmium, *Zinc, Heavy metals, Toxicity, Metals, Ions.
Identifiers: *Peanut hulls, Bark, *Metal ions.

Organic matter in waste water is oxidized in municipal plants by bacteria. When industrial and municipal wastes are combined, the bacteria are rendered ineffective by the metallic ions often contained in the wastes. A study was therefore conducted to test the ability of low-cost organic residues in removing toxic metal ions from waste water. Raw and composted southern pine bark and peanut hulls were tested for their capacity to adsorb mercury, copper, nickel, cadmium and zinc. Peanut hulls were able to adsorb significant quantities of all the metals. The smaller the peanut hull particle size, the greater the amount of metals adsorbed. At high metal concentrations they removed 117 mg metal/g solid, or 11.2% of the total. At lower concentrations, 24.4% of the metals were removed. Copper was removed to a moderate degree when pine bark was the adsorbent, but other metals were not. Composted bark, however, adsorbed large percentages of all the metals except for mercury and zinc in low concentrations. Using organic residues might be a practical way of handling wastes when only occasional shock loads are expected. Otherwise, the standard methods of ion-exchange, activated carbon, and reverse osmosis would be required. (Kutcher-FIRL)

PERFORMANCE OF DUAL-MEDIA FILTERS--I,
Standard Oil Co. (Ohio), Cleveland.
M. A. Brody, and R. J. Lumpkins.
Chemical Engineering Progress, Vol. 73, No. 4, p 83-86, April, 1977. 4 fig, 2 tab.

Descriptors: *Filtration, *Oil wastes, *Suspended solids, *Pilot plants, Industrial wastes, Activated sludge, *Waste water treatment, Activated carbon, *Filters, Pennsylvania.
Identifiers: *Refinery wastes, *Dual media filters.

The waste water treatment plant at the refinery of the BP Oil Corporation in Marcus Hook, Pennsylvania, consists of API separators, surge basins, sand filters, and an activated carbon adsorption system. There are also sludge handling and dewatering facilities for treating the sand filter backwash, the API separator bottoms, and the emulsion breaker bottoms. The filters receive a flow of 1500 to 2000 gal/min containing suspended solids and oil concentrations ranging from 50 to 150 mg/liter. Three filters operating in parallel comprise the sand filter unit. The top layer of the filter media is two and a half feet of anthracite; the bottom layer is a four and a half foot layer of sand. The operation and control systems of the filter unit are described in great detail. The system is fully automated. Hydraulic-operated valves direct the flow to the filters. The control system records flow, indicates differential pressure, and records surge basin levels. The unit was designed for each filter to handle a maximum flow rate of 1000 gal/min. The efficiencies were to be a 77% removal of suspended solids and a 79% removal of oil. Over a three year period, the actual average reductions have been about 60% for both suspended solids and oil. (See also W77-08274) (Kutcher-FIRL)
W77-08273

PERFORMANCE OF DUAL-MEDIA FILTERS--II,
Imperial Oil Enterprises, Ltd., Sarnia (Ontario).
J. C. Kempling, and J. Eng.
Chemical Engineering Progress, Vol. 73, No. 4, p 87-91, April, 1977. 7 fig, 1 tab, 5 ref.

Descriptors: *Filtration, *Oil wastes, *Suspended solids, *Pilot plants, Industrial wastes, Activated sludge, *Waste water treatment, Maintenance.
Identifiers: *Dual media filters, *Refinery wastes.

Two different applications of dual-media filtration systems for refinery effluents are presented and evaluated. In one pilot simulation study, the filters were used to remove the residual biofloc from the secondary treatment effluent of an aerated lagoon. The suspended solids removal was 80%, and the BOD removal reached 50%. Other pilot tests were run for filtering the effluent of an API separator to remove the oil and suspended solids. The Imperial Oil refinery at Sarnia, Ontario, constructed a full-scale filter based on the pilot data. Comparisons are presented of the pilot design estimates and the filter plant after 20 months of operation. The dual-media filter consisted of anthracite on top of a sand layer. Filtration took place in the lower section; filtered water was stored in the upper tank. The filter can treat 6000 gal/min of waste water. Results from the plant showed a 79% reduction in oil, with a feed concentration of 56 mg/liter and a product concentration of 12 mg/liter, whereas the pilot filtration unit showed a 75% reduction, from 33 mg/liter of oil to 8 mg/liter. For suspended solids, the plant showed a reduction of 54%, representing a drop from 43 mg/liter of suspended solids to 20 mg/liter. The pilot unit concentration dropped from 25 mg/liter of suspended solids to 12 mg/liter, or 55%. Thus the full-scale unit compares quite favorably with the pilot. During the 20 months, the filter provided consistent and maintenance-free service, while averaging a combined oil and suspended solids removal of 1.5 tons per day. (See also W77-08273) (Kutcher-FIRL)
W77-08274

TREATMENT OF AQUEOUS CONDENSATES AND EFFLUENTS FROM COKING PLANTS--WITH ALKALI SALTS OF WEAK ACIDS, TO EXPEL AMMONIA.
Netherlands Patent NL 7607-273. Issued February 25, 1977. Derwent Netherlands Patents Abstracts, Vol. Y, No. 10, p D2, April, 1977.

Descriptors: *Patents, *Ammonia, *Waste water treatment, Chemical wastes, Recycling, Industrial wastes.
Identifiers: *Coking plant effluents.

A patent was issued for a process to drive off ammonia from the aqueous condensates resulting from the coking of coal, lignite, bitumen shale and peat. It can also be used to remove ammonia from low temperature carbonization gases. The fluids containing ammonia are combined with low-volatility strong acids and mixed with aqueous solutions of carbonates or sulfides, or their hydrogen compounds, or with cyanides or the polysulfides of alkali metals. With this process, soluble salts of the strong acids are formed. NaOH or KOH solutions can be used as the treatment fluid after they have been used to remove H2S from coke oven gas. The spent sodium hydroxide solution is then pumped to an ammonia stripper; the remaining condensate from the coke oven gas is recycled to the first stage. (Kutcher-FIRL)

IS PH PRETREATMENT NECESSARY,
Wesleyan Univ., Middletown, Conn. Industrial Waste Lab.
J. W. Masselli, N. W. Masselli, and M. G. Burford.
Textile Industries, Vol. 141, No. 4, p 66a, 66c, 67, April, 1977. 1 fig, 6 ref.

Descriptors: *Waste water treatment, *Textiles, *Tannery wastes, *Alkalinity, *Organic compounds, *Treatment facilities, Industrial wastes, Biochemical oxygen demand, Effluents, *Hydrogen ion concentration.
Identifiers: *Pretreatment(Industrial wastes), Cotton mills.

In the treatment of wastes from cotton mills and tanneries which contain alkaline (10-12) pH levels, the method of neutralizing these pH levels by pretreating with organic acids is not recommended. Laboratory experience with highly alkaline textile and tannery wastes indicated that activated sludge processes will automatically normalize influents with pH's between 12 and 13, with no pretreatment needed. Examples are cited of a Cranston Print Works plant in Fletcher, North Carolina, a Warwick, Rhode Island treatment plant, and a New England cotton mill in which pretreatment with organic acids produced no useful benefits, created undesirable odors, did not aid treatability, and increased the costs of the finished goods. An alkaline pH of the plant wastes is desirable due to: the prevention of equipment corrosion; neutralization of acid wastes; prevention of hydrogen sulfide odors; prevention of hydrogen cyanide evolution; emulsification of grease, preventing pipe blockages; and increase in clarification during primary sedimentation. These wastes are automatically neutralized and converted to bicarbonate alkalinity, an excellent buffer for the 6.5 to 9.0 pH range. It was suggested that if problems are expected due to a low BOD/alkalinity ratio, acid might be added directly to the mixed liquor for the simplest and least expensive method of control. PURIFYING BIOLOGICAL EFFLUENT RICH IN CARBOHYDRATES OR PROTEIN--BY ANAEROBIC FERMENTATION SEPARATION, AEROBIC TREATMENT AND THEN SEPARATION.
French Patent FR 2308-598. Issued December 24, 1976. Derwent French Patents Abstracts, Vol. Y, No. 8, p D4, April, 1977.

Descriptors: *Patents, *Biological treatment, *Carbohydrates, *Proteins, Anaerobic conditions, Aerobic treatment, Food processing industry, Industrial wastes, *Waste water treatment, Fermentation, Sludge treatment, Recycling.

A patent was issued for a biological treatment process for aqueous effluents rich in carbohydrates or protein. These wastes are commonly found in sugar, starch, and jam factories. The liquid is first treated during an anaerobic fermentation stage. The methane formed from this phase is removed. The first sludge concentrate, obtained by separation, is recycled for further anaerobic fermentation. The remaining liquor is returned for aerobic treatment. This step is repeated in obtaining a second sludge concentrate. The process is stable, easily operable, and

eliminates problems of sludge settling and residual organic compounds containing nitrogen. (Kutcher-FIRL)
W77-08277

CHARACTERIZATION AND TREATMENT OF TEXTILE DYEING WASTEWATERS,
Crompton and Knowles Corp., Reading, Pa.
R. H. Horning.
Textile Chemist and Colorist, Vol. 9, No. 4, p 24-27, April, 1977. 5 tab, 3 ref.

Descriptors: *Textiles, *Dyes, *Industrial wastes, *Waste water treatment, Adsorption, Pollutant identification, Organic compounds, Color, Heavy metals, Lime.

A study with a threefold purpose was conducted on waste waters from the textile industry. The waste waters were characterized; evaluated for biological oxidation, carbon adsorption, chemical oxidation, and chemical coagulation; and examined for treatability with combination methods. Twenty combinations of fiber class/construction, dye, and application methods were selected as representative for the industry. The wastes were analyzed for cadmium, copper, chromium, lead, phenol, benzidine, and chlorides. The heavy metals levels were low in the tested wastes except where a metal figured in the bath formulation. Benzidine averages are difficult to obtain. Although the results from these tests showed an average value of 11.5 micrograms per liter, in actuality the value is probably much lower. Biological treatment proved very effective in removing BOD5 and it inhibited nitrification for many samples. It was much less effective for TOC removal, indicating the presence of non-biodegradable matter, and not at all effective for color removal. No single treatment effectively removed both TOC and color. Precipitation was tested with lime, alum and ferric iron salts; powdered activated carbon was used for adsorption; for oxidation ozone was used. For waste waters of carbonate alkalinity, lime was useful, allowing the formation of calcium carbonate. Coagulation procedures were best in decolorizing disperse, vat, and sulfur dyes, while carbon was best used for reactive, basic, acid, and azoic dyes. Reactive and basic dyes were easily decolorized with ozone treatment at doses of one gram per liter, but disperse dyes did not respond favorably to this treatment. Tables are presented for all dye classes and treatment methods. (Kutcher-FIRL)

EFFECT OF ACCLIMATION TO LIME-SULFIDE EFFLUENT FROM UNHAIRING CATTLEHIDES ON THE COMPOSITION OF ACTIVATED SLUDGE,
Agricultural Research Service, Philadelphia, Pa. Eastern Regional Research Center.
W. F. Happich, J. E. Cooper, E. H. Bitcover, M. M. Taylor, and J. W. Harlan.
The Journal of the American Leather Chemists Association, Vol. 72, No. 4, p 120-135, April, 1977. 7 tab, 21 ref.

Descriptors: *Activated sludge, *Tannery wastes, *Industrial wastes, Biodegradation, Heavy metals, Microorganisms, *Waste water treatment.
Identifiers: *Lime-sulfide effluent, *Waste analysis.

Experimental processes and results are described for modifying the composition of activated sludge from sanitary wastes to full strength, lime-sulfide unhairing effluent during bio-oxidation. Acclimation is defined as the adaptation and growth of activated sludge microorganisms to and in the lime-sulfide effluent. The methods for harvesting the acclimated-activated sludge and the analytical methods used in the experiment are detailed. Analyses are made of the recovered activated and acclimated-activated sludges for their inorganic composition. The acclimated-activated sludge was analyzed spectrographically. Data are given for the amino acid composition in activated sludge. Acclimated-activated sludge had a protein content of 30 to 36% while activated sludge contained 28 to 32% protein. Acclimation increased ash, inorganic sulfur compounds, and protein sulfur. Free amino acids, which were not present in activated sludge, were found in the acclimated-activated sludge. Lanthionine, a component in the lime-sulfide effluent, could be used as an indicator of the presence of alkali-degraded hair protein. Toxic heavy metal contaminants were absent from the acclimated-activated sludge and because of its protein content, it might be useful as an animal feed supplement; it could also be used as a high-lime fertilizer. (Kutcher-FIRL)

SPLIT-STREAM CHEMICAL TREATMENT (A PATENTED PROCESS BY CHEMLAN COMPANY, INC.) OF TANNING INDUSTRY WASTE WATER,
J. H. Shockcor.
The Leather Manufacturer, Vol 94, No 4, p 12, 15, 16-18, 21-22, 27, 30-31, April, 1977. 1 fig, 3 tab.

Descriptors: *Tannery wastes, *Chemical wastes, *Sludge treatment, Recycling, Flocculation, Oxidation, Suspended solids, *Waste water treatment, Industrial wastes.
Identifiers: *Chappell Process(Tanning wastes), *Split stream chemical treatment.

The Chappell Process, an innovative approach for the chemical-physical treatment of waste water from the tanning industry, is described. Operable in either the batch or continuous flow-through mode, it is based on the split-stream technique and allows for massive sludge recycling. Raw waste is discharged from a receiving tank in two separate streams, one of which receives acid treatment and the other alkaline treatment. Rapid oxidation of dissolved and suspended solids occurs at the pH extremes in each stream. When the streams recombine in a pipe leading to the flocculation tank, the oxygen demand has already been satisfied, and neutralization then takes place. The aluminum used to alter the pH precipitates at this point as an hydroxide and it is recycled for further dissolution in the two streams. The stream flows to tanks for mixing with residual sludge already formed by the process and for precipitation. Whatever sludge is not recycled is removed from the whole system for disposal. BACTERIAL GROWTH KINETICS IN THE COMPLETELY MIXED ACTIVATED SLUDGE TREATMENT OF FELLMONGERY EFFLUENT,
Rhodes Univ., Grahamstown (South Africa). Dept. of Microbiology.
D. E. Rawlings, and D. R. Woods.
Water Research, Vol 11, No 3, p 281-288, 1977. 9 fig, 1 tab, 17 ref.

Descriptors: *Kinetics, *Activated sludge, *Tannery wastes, *Bacteria, *Waste water treatment, Laboratory tests, Industrial wastes, Mathematical models, Suspended solids.
Identifiers: *Fellmongery wastes.

A kinetic study has been performed for fellmongery lime-sulfide effluent, in which the microbial growth is compared with that of domestic sewage. Fellmongery and tannery waste waters are complex mixtures, characterized by their high (11-13) pH and sulfide (700 to 2000 mg/liter) concentrations. A laboratory scale completely mixed activated sludge (CMAS) reactor with sludge recycle and controlled wasting was used to treat the fellmongery effluent. Effluent quality was significantly affected by varying the sludge age. Microbial growth in the treatment process was described by a mathematical model which may be used to design and operate effluent treatment facilities. Several equations which comprise this model are provided. In the development of the model it was demonstrated that a clear distinction must be made between volatile suspended solids and active volatile suspended solids in order to accurately describe the microbial growth kinetics. AIR FLOTATION OF OILY WASTE WATERS WITH ORGANIC COAGULANTS,
California Univ., Berkeley.
R. G. Luthy.
Available from the University Microfilms, Inc., Ann Arbor, Michigan, 48106. Order No 77-4519. PhD Thesis, 1976. 181 p.

Descriptors: *Flotation, *Oil wastes, *Waste water treatment, Flocculation, Pilot plants, Organic compounds, Polyelectrolytes, Costs.
Identifiers: *Refinery wastes.

An attempt was made to identify the conditions for removing emulsified oil from refinery waste waters by using organic coagulants. The emulsion properties affecting oil droplet flocculation and flotation were also studied. The water quality rather than the oil source is the influential factor on oil droplet properties. Tough, interfacial films, or electrical effects, or solid material adsorption at the oil-water interface create stable emulsions. It was demonstrated that a 15 mg/liter dose of 75% charged polydiallydimethylammonium polymer could remove up to 10 mg/liter of oil from API separator effluents. Large oil droplet removal was not affected by underdosing. Oil removal was best when the polymer dose gave a net zero oil droplet charge, in conjunction with efficient polymer bridging between the oil droplets. Good flocculation resulted in good flotation. Although polyelectrolyte treatment is costly, the expense is offset by savings in sludge disposal costs and by the value of the recovered oil. (Kutcher-FIRL)

TAKING ACRES OUT OF POLLUTION-CONTROL PLANS,
Metcalf and Eddy, Inc., Boston, Mass.
R. C. Atwood, W. A. Peterson, and C. W. Bowers.
Textile World, Vol 127, NO 4, p 125-126, April, 1977. 1 tab.

Descriptors: *Textiles, *Biological treatment, *Recycling, *Industrial wastes, *Waste water treatment, Water reuse, Water pollution control, Costs.

Potential cost savings through in-plant modifications and controls for the textile industry are outlined. These include the reduction of process water; the reuse of cooling, printing, and effluent waters; the recovery of several agents; the handling of effluents; and the cleaning of waters. In-plant controls may be the installation of liquid level control devices in tanks and baths, or of flow, pH, and temperature indicators on feed lines and process tanks. Wash and rinse temperatures may be better optimized and reductions may be effected in water consumption by tailoring flow to fabric width. Chemical substitution and reuse can both reduce pollutant concentration and offer savings in process chemical costs. Modifications in effluent handling may be performed in the pretreatment, in-plant, and end-of-pipe phases of treatment. Additionally, equipment is suggested for optimally cleaning the waters, such as trickling filters and rotating biological discs. Other important processes include activated sludge; extended aeration, which is an activated sludge modification; aerobic, anaerobic or aerobic/anaerobic lagooning; and physical-chemical treatment techniques. Such systems have been compared in terms of their treatment of textile effluents and it was shown that chemical coagulation and biological systems were most effective in the removal of suspended solids, BOD, COD, TDS, bacteria, color, pH, metals, and nutrients. By designing

strategies for process-water and chemical consumption, reuse, and treatment to meet the specific needs of the mill facility, effluent requirements should be economically met. (Kramer-FIRL)

Urban public services are a significant component of the overall urban system. These services are composed of both nodal (the production and processing functions) and network (the delivery or collection functions) components. Very little is known about their cost functions. Wastewater collection services are used to show how technological relationships and principles of microeconomics can be used to generate cost functions for service networks with a public works content. A wastewater collection network is broken down to the sewerline satisfying a linear demand. Then its economics, application of optimization and inputs and outputs are explored. Cost functions are derived from both hydraulic formulae and cost equations. Optimization, present design methodology and recent developments in network layout and design are then explored. The optimal choice is fitted to a convex programming framework. A 160-acre experimental module is presented as a basis for the development of normative network cost models. Minimum-cost wastewater collection networks were designed and their costs estimated for these theoretical modules. By using relationships between cost, area, population density and treatment plant cost information, items such as; tradeoffs between network and nodal costs, minimum-cost size of total surface area, and the overall service cost functions were exposed. The implications of the different methodologies and models are presented and the conceptual frameworks are outlined. (Gemmell-Illinois)

Descriptors: *Optimization, Urban drainage, Environmental engineering, *Dynamic programming, Hydraulics, *Storm drains, *Sewers, *Design criteria, *Model studies, Costs, Pipes, Cities.
Identifiers: *Urban development, Computer applications, *Discrete differential dynamic programming.

An optimization model has been developed for the minimum cost layout and design of storm sewer systems. This model can be used to determine the optimal layout, size, and crown elevations of the sewer pipes and depths of the manholes. The optimization is achieved by using a screening model consisting of two conjunctive phases: a model for the combined layout and design and a supplementary design model for prescribed layouts. The combined layout and design model is an optimization procedure based upon discrete differential dynamic programming (DDDP) which simultaneously varies both the system layout and pipe design. Drainage lines, which are imaginary lines separating manholes for investigation of possible pipe connections, are used to divide the system into stages for optimization. At each stage of the DDDP procedure, a connectivity model, which is formulated as a set-partitioning problem, is solved to determine the minimum cost layout for that stage. The combined layout and design model is an iterative stage by stage procedure resulting in a complete system layout and design after each iteration. When changes in the system layout occur for successive iterations of the combined model, the design model for given layouts is used to compute the optimal design of the previously generated layout by the combined layout and design model. The design model is also an iterative stage-by-stage optimization procedure based upon DDDP. The hydraulics of flow are accounted for by using Manning's equation and peak flows at various manhooles are added to compute flowrates for the connecting downstream pipes.

PROCESS DESIGN OF SINGLE-SLUDGE ACTIVATED SLUDGE SYSTEMS USING NITRATE RESPIRATION,
New York State Dept. of Environmental Conservation, Albany: and Rensselaer Polytechnic Inst., Troy, N.Y.
C. Beer, and L. K. Wang.
New York State Dept of Environmental Conservation, Technical Report No. 50, May 1977, 40 p., 6 fig., 4 tab, 16 ref. Presented at the 49th Annual Meeting of the New York Water Pollution Control Assoc., Jan. 17-19, 1977, New York City.

Descriptors: *Wastewater treatment, *Activated sludge, Performance, *Design, Nitrates, *Respiration, *Denitrification, Nitrogen, *Treatment facilities.
Identifiers: *Nitrate respiration, *Process design.

The flow sheets discussed have two characteristic features: (a) Utilization of nitrates as hydrogen acceptor occurs during part of the process. (b) There is not addition of an external carbon source to bring abut denitrification. Wastewater carbon compounds or the biomass of the sludge or both are used as hydrogen donor. The increased capability of removing nitrogen is one remarkable aspect of the flow sheets discussed, other noteworthy aspects are: better solids removal, better alkalinity control, energy conservation, and the possibility of using the final settler as sludge thickening device.

Descriptors: *Wastewater treatment, Activated carbon, Polyelectrolytes, Coagulation, Filtration, Centrifugation, Adsorption, *Military aspects, Nitrates, Industrial wastes.
Identifiers: *Nitrocellulose-manufacturing wastewater, *Cellulose nitrate.

Laboratory and pilot-plant studies were conducted to investigate the effectiveness of various physical-chemical processes for the separation of nitrocellulose (i.e., cellulose nitrate) from a military wastewater. Special emphasis was placed on in-line filtration (i.e., contact-coagulation-filtration), precoat filtration and conventional multimedia filtration. Three conventional treatment systems were feasible for removing at least 94% of turbidity: (a) using 200 mg/l of Cat-Floc alone as coagulant; (b) using 100 mg/l of Cat-Floc as coagulant and 100 mg/l of Bentonite clay as coagulant aid; and (c) 200 mg/l of Cat-Floc as coagulant and 750 mg/l of powdered activated carbon (Darco S-51) as coagulant aid as well as adsorbent. Another treatment method involving centrifugation was also investigated. Although direct centrifugation of the raw nitrocellulose-manufacturing wastewater could not reduce any turbidity, the combination of chemical coagulation (using cationic polyelectrolyte as coagulant and appropriate material as coagulant aid) and centrifugation could achieve more than 98% of turbidity removal.

Identifiers: *Nitrocellulose-manufacturing wastewater, *Cellulose nitrate.

The effectiveness of organic polymers in the treatment of two types of industrial wastewaters has been investigated. The experimental study consisted of initially performing batch coagulation tests followed by continuous filtration runs with the wastewater, using the results obtained in the batch tests. six polymers were used in the experiments to determine optimum type and dosage required for effective turbidity removal. The best method selected for the treatment of wastewater consisted of the addition of 100 mg/l Cat-Floc ca-

tionic polymer and 100 mg/l of powdered bentonite clay to the wastewater in a batch unit and after sedimentation, filtration of the supernatant at a flow rate of 4 gpm/sq ft. This treatment yielded a high quality filtrate with a 99.8% reduction in turbidity.

Identifiers: *Salt Lake County(Utah).

Using a conceptual model of a water supply firm, the necessary conditions for production and market efficiency are derived when renovated wastewater is considered as a potential water resource. The nature and extent of the supply augmentation due to recycled reuse is demonstrated using classical optimization techniques. Three stages of short-run supply corresponding to no recycling, partial recycled reuse and complete recycling of all reclaimable water are identified through appropriate Lagrangian multipliers as well as graphical techniques. A mathematical programming model is structured to determine the optimal water resource allocation and pricing policy for Salt Lake County. By maximizing the sum of consumer and producer surplus (the difference between total willingness-to-pay and total cost) economically efficient equilibria are derived. The feasibility of recycled reuse for municipal purposes is examined in a planning context. The impact of higher water quality discharge standards on the attractiveness of water recycling option is studied. To ensure social acceptability of renovated wastewater for culinary purposes, blending restrictions are imposed, which stipulate that the amount of water for reuse be less than a fixed percentage of the water from other sources. The effects of such a constraint on the prices and water allocation are delineated. The hydrologic uncertainty in water supply is treated using stochastic programming techniques. The resulting changes in pricing and allocation policies are discussed.

FULL SCALE OPERATION OF PLUG FLOW ACTIVATED SLUDGE SYSTEMS,
New York State Dept. of Environmental Conservation, Albany; and Rensselaer Polytechnic Inst., Troy, N.Y.
C. Beer, L. J. Hetling, and L. K. Wang.
New York State Dept of Environmental Conservation, Technical Report No 42, Aug 1975, Presented at the New England Water Pollution Control Association Meeting, Hartford, Conn., October 23, 1974, 45 p. 13 fig, 7 tab, 16 ref. EPA Project 17050 EDL.

Descriptors: *Waste water treatment, *Activated sludge, *Performance, *Operations, *Nitrification, *Denitrification, *Treatment facilities, *Oxidation, Phosphorus, Absorption, Chemical precipitation, Aeration, Nitrogen.
Identifiers: *Phosphorus removal, Waste assimilation(Nitrogen).

Six unit processes are involved in the plug flow activated sludge plant: (a) organic carbon removal by oxidation (substrate respiration); (b) organic carbon removal by assimilation (sludge production); (c) nitrogen removal by denitrification using internal hydrogen donors (H-Donors); (d) nitrogen removal by assimilation (sludge production); (e) phosphorus removal by biological uptake; and (f) phosphorus removal by precipitation, with metal ions. One characteristic feature of the process described is its high sludge production per pound of BOD removal: approximately 0.8 lbs of VSS. Approximately 52% of the nitrogen received in the plant reappears in the sludge wasted. It appears feasible to operate a nitrogen removal process at the comparatively low sewage aeration time of six hours.

AVAILABILITY OF ALUMINUM PHOSPHATE COMPLEXES TO A GREEN ALGA IN VARIOUS CULTURE MEDIA,
North Carolina Univ. at Chapel Hill. Dept. of Environmental Sciences and Engineering.
J. C. Matheson, III.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-268 510, Price codes: A07 in paper copy, A01 in microfiche. M.S. Thesis, 1975. 119 p, 16 fig, 10 tab, 68 ref, append. OWRT A-075-NC(1). 14-31-0001-4033.

Descriptors: Algae, Assay, *Phosphates, Phosphorus, *Eutrophication, Tertiary treatment, Aluminum, Nutrients, Nutrient removal, *Cycling nutrients, Bioassay, *Chlorophyta, *Waste water treatment.
Identifiers: Algal assay, *Aluminum phosphate, Phosphorus removal, *Selenastrum capricornutum.

The availability of phosphate contained in alum floc as a nutrient for algal growth was assessed in culture conditions that simulated natural waters receiving alum floc overflowing from tertiary wastewater treatment facilities. Potassium salts of phosphate were flocculated with alum and compared in unialgal cultures of Selenastrum capricornutum (Printz) with unflocculated potassium phosphate, a commercially available mixture of variscite and metavariscite (mineral aluminum phosphate), and 'P-free' controls for support of algal biomass. Culture conditions controlled pH within the pH 7-8 range in some media and went higher in others. Media were formulated such that the importance of 'artificial' cultural variables, that is, presence of EDTA and pH buffering systems, and 'real world' variables, that is, thermodynamically determined equilibrium concentrations and flocculation conditions, could be compared relative to one another for their control of

aluminum phosphate complex availability. The algal assay system was a reasonable model of a natural aquatic system with respect to alum-flocculated phosphate availability. Under all culture conditions, alum-flocculated phosphate was largely or entirely available to Selenastrum as a phosphorus source. In tests of the mineral aluminum phosphate mixture, very slow or no growth was observed. This difference in availability probably resulted from more rapid dissolution of phosphate from amorphous 'hydroxo aluminum phosphate' than from the crystalline form, a variable that could possibly be controlled by flocculation conditions and floc aging. (Stewart-NC State)

THE SOLUBILITY OF PARTICULATE PHOSPHORUS IN THE EFFLUENT FROM ALUM TREATMENT OF WASTEWATER AND PHOSPHORUS SOLUTIONS,
North Carolina Univ. at Chapel Hill. Dept. of Environmental Sciences and Engineering.
B. A. Dempsey.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-268 519, Price codes: A05 in paper copy, A01 in microfiche. M. S. Thesis, May 1975. 67 p, 20 fig, 4 tab, 57 ref. OWRT A-075-NC(2). 14-31-0001-4033.

Descriptors: *Nutrient removal, Cycling nutrients, Phosphorus, Aluminum, Eutrophication, *Tertiary treatment, Algae, Chelation, *Waste water treatment, Solubility.
Identifiers: *Phosphorus removal, *Alum precipitation, Algal growth, Chelating agents, Phosphorus cycling, Alum treatment.

The effluent from alum treated wastewater streams and the decanted supernatant from alum precipitated phosphorus solutions contain a particulate fraction that is made up of aluminum and phosphorus. These naturally suspended complexes were diluted into pH, temperature, and ionic strength controlled receiving waters. In all cases, filterable reactive phosphorus in the receiving water reached a plateau concentration within 24 hours. Diluted effluent from the wastewater stream solubilized less than 10 ug/l filterable reactive phosphorus between pH 6.0 and 7.2. Diluted supernatant from alum-precipitated solutions solubilized greater than 10 ug/l at all pH values. Filterable reactive aluminum concentration was measured in certain experiments, and pKsp's calculated for ALPO4 and AL(OH)3. Effects of other parameters on the solubility of aluminum-phosphorus complexes are reported. (Stewart-NC State)

INVESTIGATION OF COAGULATION - PRECIPITATION AND ULTRAFILTRATION FOR THE REGENERATION OF BRINES IN THE CUCUMBER PICKLE INDUSTRY,
North Carolina Univ. at Chapel Hill. Dept. of Environmental Sciences and Engineering.
L. F. Horney.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-268 651, Price codes: A04 in paper copy, A01 in microfiche. M.S. Thesis, 1975. 50 p, 7 fig, 10 tab, 36 ref. OWRT A-079-NC(1), 14-31-0001-4033.

Descriptors: *Food processing industry, Brine disposal, *Coagulation, *Waste water treatment, Industrial wastes, *North Carolina, Water reuse, *Chemical precipitation.
Identifiers: *Ultrafiltration, Cucumber pickles, Brine regeneration, *Brine reuse, Food processing wastes, Coagulation-precipitation, *Pickle industry.

Brine wastes in the cucumber pickle industry was studied, and regeneration of these wastes for subsequent reuse was considered the most feasible method of treating these wastes. One of the major factors in the reuse of brines is the necessity to remove the softening enzyme, polygalacturonase, syn. pectinase. Two methods of regeneration were studied in detail: (1) chemical coagulation-precipitation with lime and NaOH to pH 11.5 followed by neutralization with acetic acid and (2) ultrafiltration. The former method was tested on 11 different spent brines to determine amounts of chemicals needed and to analyze brine characteristics before and after precipitation. Spent brine and 36-hr brine samples were filtered through a range of ultrafilter pore size in two modes, in series and in parallel, to determine the ultrafilter size necessary for pectinase rejection. PM10 and UM2 gave the best rejection. While both types of treatment remove pectinase activity without affecting the salinity, neither significantly lowered other organic materials as measured by TOC and COD. (Stewart-NC State)

STATE OF THE ART IN SEWAGE TREATMENT PLANT CONTROL,
Lund Inst. of Tech. (Sweden).
G. Olsson.
In: Chemical Process Control, Foss, A. S., and Denn, M. M., Editors, AIChE Symposium Series, Vol. 72, No. 159, p 52-77, 1976. 5 fig, 126 ref.

Descriptors: *Reviews, *Waste water treatment, *Treatment facilities, *Automatic controls, Instrumentation, Chemical treatment, Analytical treatment, Monitoring, Computers, Performance, Tertiary treatment, Design criteria, Model studies, Biological treatment, Sludge treatment, Chemical properties, Biological properties, Physical properties, Flow, Biochemical oxygen demand, Dissolved oxygen.

Waste water treatment is a non-profit industry where there is little incentive for designing an optimal cost-effective system. For this reason and because of inherent difficulties in treatment methods, there is a lack of information on the benefits and costs of automatically controlled treatment. Sewage treatment plants are centered on the removal of contaminants which are vastly varied and of such small concentrations that few have measurable levels. This is the major obstacle to designing instrumentation for control purposes. Influent and effluent qualities are measured by BOD, COD, TOC, total phosphorus, nitrogen, suspended solids, trace metals, trace organics, pesticides, and viruses. Selection of relevant information for control and instrumentation is a must, but the lack of dynamic models to determine essential variables places a real limitation on sensors and equipment. Temperature variations from seasonal changes also affect control efforts. The spatial distribution of sedimentation basin concentrates, and the changes in character of biological reactor processes also present control problems. Process design and control system design should be considered in treatment system design; collection systems should be operated so that flow rate or water quality changes can be predicted early and flow to the plant can be controlled. The application of various models for design, flow prediction, and routing were explored, as were current operational practices. Control and monitoring were illustrated through descriptions of the activated sludge process, settler dynamics, dissolved oxygen control, biological systems, water quality systems, phosphorus removal by chemical precipitation, and in-plant computer use. CLAY ADSORPTION TREATMENT OF NON-IONIC SURFACTANTS IN WASTE WATER,
Delware Univ., Newark. Dept. of Civil Engineering.
J. G. Carberry, C. J. Twardowski, and D. K. Eberhart.
Journal Water Pollution Control Federation, Vol. 49, No. 3, p 452-459, March, 1977. 11 fig, 4 tab, 11 ref.

Descriptors: *Adsorption, *Clays, *Surfactants, Separation techniques, Physical properties, Chemical properties, Analysis, *Waste water treatment, Evaluation, Particle size.
Identifiers: *Clay adsorption treatment.

Non-ionic surfactant adsorption studies were conducted using clays. Bentonite clays were found to adsorb 10 to 20 times better than activated carbon on a weight basis of surfactant removed per weight of adsorbent. Three clays which were able to remove non-ionics from waste water were Mineral Colloid 103, Accofloc 352, and Bentolite L. Mineral Colloid 103 had the best adsorptive capacity. Higher interaction energies were found for liquid non-ionic surfactants than those predicted for gases. Micelle formation and deposition might account for such large interactions with adsorptive surfaces. Accofloc 352 had the lowest interaction energy and might be the easiest to regenerate. A decrease in adsorptive capacity was found in continous flow studies as compared to determinations from batch isotherm studies. This was partially due to increased bed particle size to allow gravity flow through the column. Mineral Colloid 103 had the largest adsorptive capacity in continuous flow studies. No studies of regeneration of clay surfaces, or economic comparisons of batch treatment or gravity flow through fixed columns were attempted. (Collins-FIRL)

REVERSE OSMOSIS ON SECONDARY SEWAGE EFFLUENT: THE EFFECT OF RECOVERY,
Australian Atomic Energy Research Establishment, Lucas Heights.
R. Wechsler.
Water Research, Vol. 11, No. 4, p 379-385, 1977. 6 fig, 1 tab, 5 ref.

Descriptors: *Reverse osmosis, *Treatment facilities, *Performance, Salinity, Pilot plant, *Sewage treatment, Aeration, Sedimentation, Membrane processes, Chemical oxygen demand, Organic matter, Economics, *Waste water treatment, Australia.

The effects of reverse osmotic recovery on plant performance and product quality was evaluated in a pilot scale municipal waste water reclamation plant in Australia. Raw sewage was comminuted and screened, passed to grit chambers and pre-aeration tanks, moved to primary settling tanks, and passed to a step aeration activated sludge plant where waste sludge was recycled to pre-aeration tanks. The secondary effluent was passed to a canal system. The effluent was passed to the reclamation plant where chemical clarification and reverse osmosis with optional granular carbon polishing took place. The reverse osmosis plant consisted of two macroscopic tubular modules having membranes annealed at 80 and 86 C, respectively. Brine velocity was 120 cubic meters/second under a brine loop pressure of 40 atmospheres, and a temperature of 25 C. Results indicated that the product salt concentration increased as the plant recovery increased. Its organic component concentration did not significantly increase when recovery increased. The flux decline rate did not prohibit recovery if the crystallization of hardness causing substances was prevented. Lime clarification was recommended if recovery was to be reasonably economical. Cleaning by depressurization and sweet water flushing, daily, maintained membrane productivity at 90% of maximum. Cleaning was not affected by plant recovery. It was concluded that the salt concentration tolerated by the product, and not the rate of flux decline or organic matter concentration, limited recovery. Because of the cost of prior treatment steps, it was suggested that reverse osmosis be operated at maximum daily recovery. (Collins-FIRL)
W77-08523

TREATMENT OF HIGH STRENGTH ACIDIC WASTE WATER WITH A COMPLETELY MIXED ANAEROBIC FILTER,
Illinois Univ. at Urbana-Champaign. Dept. of Civil Engineering.
E. S. K. Chian, and F. B. DeWalle.
Water Research, Vol. 11, No. 3, p 295-304, 1977. 10 fig, 1 tab, 23 ref. EPA 68-03-0162.

Descriptors: *Filtration, *Anaerobic conditions, *Biological treatment, *Alkalinity, Sludge treatment, *Waste water treatment, Filters, Chemical oxygen demand, Suspended solids, Organic matter, Hydrogen ion concentration, Heavy metals, *Filters.
Identifiers: *Mixed anaerobic filters.

High strength acidic waste water was treated with a completely mixed anerobic filter. The waste water was a leachate typical of that in solid waste landfills, containing free volatile fatty acids and complex high molecular weight carbohydrate-like organics. Treatment by the mixed anaerobic filter was successful, and eliminated the costs of buffer solutions needed with plug flow anaerobic filters. Heavy metal toxicity was counteracted by adding sulfides. The system's response to increased organic loading and shockloads was quite good. A hydraulic detention time above 7 days produced high percentages of organic matter removal. Methane gas leaving the unit indicated a low bacterial solids manufacture, accounting for 93% of the COD removed. About 0.12 grams of volatile suspended solids were removed for each gram of COD removed. No nutrient additions were required because of the low solids production and initial anaerobic sludge seeding. (Collins-FIRL)

OXYGEN AERATION AT NEWTON CREEK,
New York State Dept. of Water Resources, New York.
N. Nash, P. J. Krasnoff, W. B. Pressman, and R. C. Brenner.
Journal Water Pollution Control Federation, Vol. 49, No. 3, p 388-400, March, 1977. 4 fig, 6 tab. EPA Project 11010 GEV.

Descriptors: *Aeration, *Oxygen, Activated sludge, Treatment facilities, Performance, Sewage effluents, Biochemical oxygen demand, Suspended solids, Microorganisms, Sludge treatment, *Waste water treatment, New York.
Identifiers: *Newton Creek(NY).

Plant-scale tests have indicated that pure oxygen substituted for process air can upgrade overloaded activated sludge plants. This method was further examined at the Newton Creek, New York, modified aeration plant. Over the three-year test period, effluent quality averaged 19 milligrams/liter of both BOD and total suspended solids, at flow rates of 38,200-134,000 cubic meters/day. The equivalent removal efficiencies were 89% for BOD and 86% for suspended solids. Effluent quality was slightly poorer during warm weather, non-filamentous periods, although overall efficiency was slightly greater at those times. During four cold weather periods when fungal organisms proliferated the effluent quality dropped. The predominant fungus that caused recurrent difficulties in winter was identified as Geotrichum. The concentration of filamentous organisms in the system affected process efficiency in a proportional manner. Oxygen consumption averaged 1.0 grams/gram of BOD removed at, or above, design flow rates. At these levels, the power requirement averaged 0.95 kilowatt-hours per kilogram of BOD removed. During filamentous periods, solids production averaged 1.27 grams/gram of removed BOD, and 0.93 grams during nonfilamentous periods. (Collins-FIRL)
W77-08526

AEROBIC DIGESTION OF WASTE ACTIVATED SLUDGE AT LOW TEMPERATURES,
British Columbia Univ., Vancouver. Dept. of Civil Engineering.
D. A. Koers, and D. S. Mavinic.
Journal Water Pollution Control Federation, Vol. 49, No. 3, p 460-468, March, 1977. 8 fig, 12 ref.

Descriptors: *Sludge digestion, *Aerobic conditions, Temperature, Activated sludge, *Waste water treatment, Sludge treatment, Treatment facilities, Biological treatment, Microorganisms, Biochemical oxygen demand, Oxygen, Hydrogen ion concentration, Chemical properties, Physical properties.
Identifiers: *Aerobic digestion.

A study was conducted on the design and operating criteria of aerobic digestion systems handling activated sludge under cold climate conditions. Comparative data were generated for operation at various low temperatures. A field evaluation of laboratory results was the final part of the study. Study temperatures were 20, 10 and 6 C. Results indicated little difference between continuous and semi-continuous digester operations. The major exception was a volatile suspended solids (VSS) reduction at 5 C with the semi-continuous digester method. There was a good correlation between the product of sludge age and temperature and VSS reduction at 5-20 C. There is little VSS reduction after this product exceeds 250. At low temperatures, a 50-day sludge age results in the maximum VSS reduction of nearly 30%; 5 C is the lowest average monthly digester temperature. Full-scale operations were too variable for steady-state conditions to be established. Mixed liquor BOD was thought to be a promising parameter for measuring digested sludge stability during storage when odor is used as a criterion for stability. Sludge with a BOD5 of less than 9.29 grams/gram of VSS was odor-free after storage at 20 C. Stabilization was achieved at a sludge age of 40 days at 20 C, and at 60 days at 10 C, but not even 80 days achieved sludge stability at 5 C. Cell mass characteristics, measured by TOC, COD, organic nitrogen, and volatile content, was extremely constant for all systems. Biodegradability seemed to decrease with increased sludge age. The basic composition of the sludge cells did not appear to change during aerobic digestion. (Collins-FIRL)
W77-08527

DEWATERING: A NEW METHOD BOWS,
Ecodyne Corp., Kans. Smith and Loveless Div.
J. A. Bell, R. Higgins, and D. G. Mason.
Water and Wastes Engineering, Vol. 14, No. 4, p 33-34, 39-41, April, 1977. 5 fig, 10 tab, 2 ref.

Descriptors: *Dewatering, *Filtration, *Sludge treatment, Equipment, Polyelectrolytes, Performance, Evaluation, Treatment facilities, Polymers, Chemical treatment, Sedimentation, Tertiary treatment, *Waste water treatment.
Identifiers: Gravity pressure filtration, Aerobic digestion.

A gravity-pressure filtration system, or sludge concentrator, has been developed to dewater sludges from various treatment processes and, especially, to take advantage of polyelectrolyte-conditioned sludge characteristics. The concentrator is provided with a sludge feed pump, a polymer system, a sludge conditioning system, and a two-stage dewatering unit. A combination flashmixer-flocculator provides optimum mixing of the diluted polymer and sludge to form large particles prior to gravity dewatering. In the pressure stage, three sets of compression rollers squeeze out more liquid and the dewatered sludge is discharged for final disposal. Sludge volume can be reduced as much as 80%. Models are provided which can process up to 1600 dry pounds of sludge/million gallons in a 40 hour week. Comparisons with vacuum filtration indicated that a 250-square foot vacuum filter would be needed to dewater the same amount of sludge as the larger concentrator model. The vacuum filter does use less polymer material, but this is offset in the concentrator by lower energy requirements. Operating costs are lower with gravity-pressure filtration. Two treatment plants operated at different flows were used for sludge evaluation. In one, a secondary treatment facility, effluent could be discharged or diverted to tertiary treatment with combined flash-mixing, flocculation, clarification and thickening of chemically treated waste. Raw sewage was used in this facility. Secondary effluent was used instead of raw sewage in the same scheme for the second facility. Settling was aided by the addition of anionic polymers. Sludge from biological treatment was evaluated for its dewaterability. In both facilities, effluent quality met acceptable levels for the processes employed. (Collins-FIRL)
W77-08528

ENZYMATIC TREATMENT OF PRIMARY MUNICIPAL SLUDGE WITH TRICHODERMA VIRIDE CELLULASE,
State Univ. of New York at Buffalo. Dept. of Chemical Engineering.
G. V. Cinq-Mars, and J. Howell.
Biotechnology and Bioengineering, Vol. 19, No. 3, p 377-385, March, 1977. 3 fig, 3 tab, 9 ref.

Descriptors: *Sludge treatment, *Biological treatment, Physical properties, Chemical properties, Municipal wastes, *Waste water treatment, Hydrolysis, Sludge digestion, Chemical degradation, Enzymes.
Identifiers: *Trichoderma viride, *Enzymatic treatment.

Experiments were conducted to determine the feasibility of sludge pretreatment before digestion with cellulase in order to reduce cellulose content and viscosity. Pretreatment was either by sterilization at 120 C for 30 minutes, followed by adding 100 ppm merthiolate and homogenizing for 2 minutes, or by heat pasteurization to 95 C and cooling to 50 C. Hydrolytic experiments produced

the following results. Up to 75% of the cellulose was converted, mostly to cellobiose, in 24 hours. Raw primary sludge was changed from a gel-like consistency to a slurry of fine particles amenable to ultrafiltration. Possible rate limiting steps in the conversion of cellulose to methane by anaerobic digestion could be reduced by converting cellulase to soluble reducing sugars before digestion; by making reducing sugars available to allow an increased generation of microbial populations; and by a faster transfer of dissolved products from liquid to gas phase. An economical, self-supporting treatment system might be possible with the use of process filtrate for cellulase, single-cell protein, or alcohol production. (Collins-FIRL)
W77-08529

AEROBIC DIGESTION OF SLUDGES PRECIPITATED FROM WASTE WATER BY LIME ADDITION,
Toronto Univ. (Ontario). Dept. of Civil Engineering.
M. F. Hamoda, and J. Ganczarczyk.
Journal Water Pollution Control Federation, Vol. 49, No. 3, p 375-387, March, 1977. 4 fig, 7 tab, 12 ref.

Descriptors: *Aerobic treatment, *Sludge digestion, *Lime, Physical properties, Chemical properties, Treatment facilities, Biological treatment, Evaluation, *Waste water treatment, *Chemical precipitation.
Identifiers: *Aerobic digestion, Chemical treatment.

Laboratory batch and semi-continuous aerobic digestion experiments were performed to examine the behavior of lime-primary sludges precipitated with various lime dosages over an operational pH range. Sludge samples were obtained from a Toronto treatment plant. Results indicated that aerobic digestion of lime-primary sludges was technically feasible, though high lime doses adversely affected digestion process kinetics. The buffering capacity of the digestion system was good. Total alkalinity of the lime-primary sludge did not decrease because of aerobic digestion. However, the primary sludge decreased in alkalinity as aeration time increased. Nitrification was adversely affected in digesters treating lime-primary sludges when lime doses were high. Primary sludges as well as lime-primary sludges bound soluble phosphorus and soluble organic carbon during digestion and released these components during storage. Settling and filtration qualities of the aerobically digested lime-primary sludges were good. Semi-continuous digesters produced sludges with higher oxygen uptake rates, better dewaterability, and higher supernatant quality than those of batch systems. The pollutant content of sludges from semi-continuous systems should not cause serious loading problems if the supernatants are recycled or discharged by treatment plants. A sizable population of stalked ciliates and rotifers was maintained in digesters treating lime-primary sludges. Stabilization of lime-primary sludges requires a 15-day detention period at 20 C, especially if they have initial pH values of 10-12. (Collins-FIRL)

PHYSICOCHEMICAL TREATMENT OF AN AUSTRALIAN MUNICIPAL WASTE WATER,
Commonwealth Scientific and Industrial Research Organization, Melbourne (Australia). Div. of Chemical Technology.
S. Y. Ip, L. O. Kolarik, N. H. Pilkington, W. G. C. Raper, and E. A. Swinton.
Water Research, Vol. 11, No. 2, p 173-180, 1977. 9 fig, 5 tab, 4 ref.

Descriptors: *Australia, *Pilot plants, *Ion exchange, *Resins, Coagulation, Sedimentation, Ammonia, Lime, Infiltration, Activated carbon, Filtration, Water purification, *Waste water treatment, *Treatment facilities, Desalination, Hydrogen ion concentration.
Identifiers: Physicochemical treatment.

A pilot study was conducted to investigate physicochemical treatment (PCT) of waste water; to investigate integration of the 'Sirotherm' partial desalination process; and to test laboratory studies on applying magnetic ion-exchange resins to water purification. The plant uses lime coagulation at pH 11.5 with solids removal by flotation or sedimentation; ammonia stripping; neutralization to pH 10 by carbon dioxide; coagulation of precipitated calcium carbonate by ferric salts; clarification and sand-filtration; surfactant removal by foaming; water neutralization to pH 7; and granular activated carbon treatment. The plant produced a high-quality water from a constant flow of primary settled waste water. Operation was simple and practical. Lime scum flotation was effective with normal flows, but not when the flow was diluted with wet weather infiltration. Sedimentation was considered more reliable. Winter conditions did not substantially affect ammonia stripping, but packing scaling occurred. Granular carbon treatment was effective. Raw sewage treatment was not attempted; nor was operation in a total disposal mode or testing with varying flow rates. A buffer capacity between lime treatment and other stages was suggested. (Collins-FIRL)

BIOLOGICAL TREATMENT KINETICS OF LANDFILL LEACHATE,
Texas Univ. at Arlington. Dept. of Civil Engineering.
T. Palit, and S. R. Qasim.
Journal of the Environmental Engineering Division-ASCE, Vol 103, No EE2, p 353-366, April, 1977. 8 fig, 4 tab, 3 append.

Descriptors: *Leachate, *Landfills, *Kinetics, *Biological treatment, Activated sludge, Nutrients, Sewage treatment, Phosphorus, Sewers, Treatment facilities, *Waste water treatment.

Results are presented of biological treatment studies with landfill leachate. Biological kinetic coefficients were determined for landfill leachate with mean cell residence time as the only variable. Comparisons were made with those of the sanitary sewage. Results indicated that landfill leachate could be treated in an activated sludge plant. Sludge bulking occurred several times during experimentation and could be a serious problem. Additional nutrients may be necessaary to enhance plant performance since leachate contained low concentrations of prime nutrients. Combined leachate and sewage treatment may be beneficial, but further research is needed to determine the optimum mixing ratio. Conventional activated sludge with added phosphorus is an adequate treatment in areas where domestic sewers are not available. (Collins-FIRL)

PROGRESS IN MHI'S INTEGRATED TECHNIQUES FOR ENVIRONMENTAL PROTECTION,
Mitsubishi Heavy-Industries Ltd., Tokyo (Japan). Environmental Technology Dept.
K. Matsumoto.
Technical Review, Vol 13, No 3, Ser. 37, p 173-191, October, 1976. 15 fig, 9 tab.

Descriptors: *Water pollution sources, *Air pollution sources, *Pollution abatement, *Environmental control, Treatment facilities, Water reuse, Sludge treatment, Sludge disposal, Organic matter, Drying, Incineration, Oil wastes, Biological treatment, Denitrification, Filtration, Solid wastes, Liquid wastes, Analytical techniques, Water quality control, Gases, *Waste water treatment.

Results of recent advancements in water and air pollution control technology developed by Mitsubishi Heavy Industries, Limited, are presented. Water pollution control developments included treatment techniques for potable water, industrial water, sewage, night soil, and industrial wastes. Sludge concentrating devices, vacuum filter, centrifugal, and filter press dehydrators, and incinerators were discussed and described, as well as various water reuse schemes. New techniques have been developed to forecast effluent dispersion for preventing water pollution. Denitrification and trickling filter development were discussed with advances in solid wastes treatment. In addition, air pollution control, detection, and abatement were reviewed. (Collins-FIRL)

THE SANITARY LANDFILL LEACHATE CONTROL PLANT IN KOBE.
Technical Review, Vol 13, No 3, Ser. 37, p 273-274, October, 1976. 2 fig, 1 tab.

Descriptors: *Leachate, *Landfills, *Treatment facilities, *Waste water treatment, Water quality control, Soil contamination, Design criteria, Sanitary engineering, Biological treatment, Chemical treatment.
Identifiers: *Kobe(Japan).

A leachate control plant was constructed in Kobe, Japan, to treat leachate containing high amounts of BOD, COD, suspended solids, ammonia, and colored matter. The plant employs a storage dam to create a uniform quality and quantity of leachate for treatment; trickling filter towers for organic matter removal and ammonia nitrogen oxidation; sedimentation and flocculation-sedimentation facilities; denitrification columns; activated carbon adsorption columns; and dewatering processes. Special design considerations include a trickling filter process to avoid difficulties in the biological treatment of long-term landfill leachate, a biological filter process for denitrification which has few operational problems and low maintenance needs, and combined biological and physical-chemical treatment to adjust water quality for economical operation at optimum conditions. CHARACTERIZING SLUDGE FOR CENTRIFUGAL DEWATERING,
Duke Univ., Durham, N. C. Dept. of Civil Engineering.
P. A. Vesilind.
Filtration and Separation, Vol 14, No 2, p 115-116, 118, 120, March/April, 1977. 5 fig, 3 ref.

Descriptors: *Dewatering, *Centrifugation, *Sludge treatment, Solid wastes, Equipment, Physical properties, Chemical properties, Waste treatment, *Waste water treatment, Design criteria.

The design of sludge dewatering equipment must depend upon characteristics of the sludge to be treated. Sludge characteristics were described which would enable engineers to specify conditions for the guaranteed performance of the equipment. A procedure was outlined for the measurement of settling properties under high centrifugal forces. Batch settling tests could be performed at high gravitational forces using a desktop centrifuge and a strobe light. Sludge-filled tubes are spun horizontally and the strobe is synchronized with the centrifuge so the height of the slurry-liquid interface can be observed. Settling of the uppermost particle in the slurry can be followed and its velocity calculated. This velocity measurement has the disadvantage of being dependent upon the force imposed, which can be eliminated by using a 'settling coefficient' concept. Other characteristics which indicate the ability of the sludge to be centrifuged include the clarity of the centrate and the ability of the sludge to be moved by the screw conveyor. (Collins-FIRL)

OZONE AND CHLORINE IN WASTE WATER DISINFECTION,
Okayama Univ. (Japan). Dept. of Civil Engineering.
O. Kawara.
Memoirs of the School of Engineering, Okayama University, Vol 11, No 2, p 37-49, January, 1977. 20 fig, 3 tab, 4 ref.

Descriptors: *Disinfection, *Chlorine, *Ozone, Oxidation, Aerobic bacteria, Toxicity, Suspended solids, Sewage effluents, *Chlorination, Biodegradation, *Waste water treatment.

The disinfection efficiency, oxidation power, and effects of ozone- or chlorine-treated secondary effluents on aerobic microorganisms were compared in ozone and chlorine waste water treatment. Disinfection of coliforms required a smaller dosage of chlorine than ozone, but chlorine could not sterilize them as completely, even at high doses, or as quickly, as ozone. Ozone should be used where both disinfection and organic compound removal are desired. Suspended solids are well-decomposed, as are the higher molecular compounds. Chlorine has little effect on these substances. Certain compounds which are conducive to aerobic bacterial growth are easily decomposed by ozone, but not by chlorine. Microbial growth rates were lowest in the control, and increasingly greater in ozone-treated effluents, chlorine-treated effluents, and secondary effluents. Ozonation increased biodegradability and chlorination decreased it. It was concluded that chlorination is an effective process when effluents do not contain high amounts of suspended solids and their removal is not the major desired result. (Collins-FIRL)

UNSTRATIFIED-BED FILTRATION OF WASTE WATER,
Iowa Natural Resources Council, Des Moines.
M. F. Dehab, and J. C. Young.
Journal of the Environmental Engineering Division-ASCE, Vol. 103, No. EE1, p 21-36, February, 1977. 11 fig, 4 tab, 2 append. EPA Project 17030 DKG.

Descriptors: *Filters, *Suspended solids, *Performance, *Filtration, Air, Flocculation, Design, Water purification, Analysis, Physical properties, Separation techniques, *Waste water treatment.
Identifiers: *Unstratified-bed filtration, Backwash characteristics.

An investigation was conducted to determine the suspended solids removal and backwash characteristics of single-medium unstratified-bed filters and to determine the effect of media grain size and type on performance and backwash characteristics. Comparisons were made with dual-media filters. It was found that the unstratified-bed filters with the same effective size medium used as in the top layer of dual-media filters would provide the same effluent quality and run length as the dual-media filters. Use of these filters with combined air-water wash allows a larger filter medium size than that of dual or multimedia filters. In-depth filtration is improved with larger sized filter mediums, and solids capture capacity is increased, as is the run length. Suspended solids removal is not significantly reduced by increasing media size from 1 millimeter to 2 millimeters at filtration rates of 5-10 meters/hour. Filter bed depths above 914 millimeters produce no effective increase in effluent quality with filter mediums of an effective size of 1.3-1.5 millimeters. Backwash rates for effective cleaning of these filters are less than what is needed to fluidize the medium. Solids removal from the filter during backwash using air and water required nearly 4 cubic meters of water per square meter of filter area for backwash rates of 18.75-37.5 meters/hour. Combined air and water treatment during backwash improved the washout of large flocculated solids from the space above the filter bed, and eliminated mudball formation. Media loss during this last operation is significant unless appropriate design and operating control measures are used. (Collins-FIRL)

EFFECTS OF HIGH ORGANIC LOADING ON MIXED PHOTOSYNTHETIC WASTE WATER TREATMENT,
Cape Town Univ. (South Africa). Dept. of Chemical Engineering.
S. Miller, A. Abeliovich, and G. Belfort.
Journal Water Pollution Control Federation, Vol. 49, No. 3, p 436-440, March, 1977. 2 fig, 4 tab, 14 ref.

Descriptors: *Organic loading, *Organic matter, Loads(Forces), *Photosynthesis, Dissolved oxygen, Bacteria, Temperature, Hydrogen ion concentration, Detergents, Biodegradation, Municipal wastes, Hospitals, Algae, Oxidation lagoons, Aerobic conditions, Biochemical oxygen demand, Carbon, Suspended solids, Nitrogen, Water purification, *Waste water treatment.
Identifiers: Hospital wastes.

Hospital and domestic sludge was studied to determine the effect of high organic loading on mixed photosynthetic waste water treatment. The major inhibitors in hospital effluents on algal growth in treatment ponds are most likely to be detergents, solvents, and antibiotics. Tests were run to establish whether the greater carbon supplies and lower pH variation resulting from using sludge outweighed the disadvantage of decreased light penetration. Temperature, pH, dissolved oxygen, photosynthesis, and respiration rates were recorded daily. Results showed the more alkaline hospital sludge to have a lower buffering capacity than domestic sludge. Little pH variation was found in the mixed photosynthetic system. There was evidence that appreciable algae growth was possible with hospital effluents after the bacteria had adapted to environmental conditions. Respiration rates decreased continuously in reactors with sludge added. Dissolved oxygen proved a good indicator of the state of the system. Oxygen levels were high at high pH where carbon limitation might be evident. Sludge biodegradation, usually anaerobic, results in significant carbon losses in the form of CH4 and CO2. The tests showed that a greater algal yield without impairment of water quality can be expected in photosynthetic system with high organic loading. (Collins-FIRL)

WHAT LIES AHEAD FOR PAC,
Culp, Wesner, El Dorado Hills, Calif.
G. L. Culp, and A. J. Shuckrow.
Water and Wastes Engineering, Vol. 14, No. 2, p 67-72, 74, February, 1977.

Descriptors: *Activated carbon, Costs, *Cost comparisons, Municipal wastes, *Waste water treatment, Polymers, Dewatering, Organic matter, Hydrogen sulfide, Activated sludge, Physical properties, Chemical properties.
Identifiers: Granular activated carbon, *Powdered activated carbon.

The development and use of powdered activated carbon were discussed. Granular activated carbon has found wider use because efficient regeneration systems for powdered activated carbon are lacking. Several advantages of the powdered carbon are: a significantly lower price; more rapid equilibration with soluble waste water organics; less capital investment; easily changed dosages; less head loss; and easy avoidance of hydrogen sulfide formation problems. Cost estimates of various treatment systems indicated that independent physical-chemical (IPC) systems, with either granular or powdered carbon, were not cost competitive with conventional activated sludge for BOD removal in municipal use when only secondary treatment was necessary. Granular carbon IPC systems were cost comparable to activated sludge followed by coagulation and filtration at carbon doses of 1500 pounds/million gallons. It was slightly less expensive at doses of 750 pounds/million gallons. Powdered carbon was not cost competitive with granular carbon. It has higher capital and labor costs, higher fuel requirements, and requires polymer conditioning for dewatering. Determining the minimum carbon dosages compatible with single clarifier-combined sludge handling systems would yield economically favorable results. (Collins-FIRL)

DEWATERING MACHINES (ENTWASSERUNGSMACHINEN),
K. C. Shin.
Wasser, Luft und Betrieb, Vol 21, No 3, p 137-141, 1977. 8 fig, 3 tab, 3 ref.

Descriptors: *Dewatering, *Equipment, *Sludge treatment, Filters, Centrifugation, Filtration, Separation, Treatment facilities, Performance, *Waste water treatment.

The principal types of waste water sludge dewatering equipment used currently and their general characteristics are described. Centrifuges, belt filters, and chamber filter presses represent the most common means for dewatering sludge. Centrifuges can be used for any size waste water treatment plant because they are available for a wide range of throughput capacities. Chamber filter presses, which have separating efficiencies, are especially suitable for use in large-capacity waste water treatment facilities. Belt filters are used for treatment plants of small to medium capacity. S type filter belt presses can reach separation efficiencies as high as 99%. (Takacs-FIRL)

Descriptors: *Oxygenation, *Activated sludge, *Adsorption, *Cryogenics, Dissolved oxygen, Treatment facilities, Temperature, Aeration, Nitrogen, Air, Automation, Maintenance, Water purification, *Waste water treatment.
Identifiers: Pure oxygen activated sludge treatment, Liquid oxygen.

Pure oxygen activated sludge treatment processes are replacing aerated systems because of the latter's weaknesses in transferring oxygen from the atmosphere to the liquid medium. In a pure oxygen system, the oxygen is infused in concentrated form into the liquid. As a result, the quantity of transferred oxygen is 6.4 times greater than in aerated system. Large quantities of dissolved oxygen (6-8 mg/liter) can be present in the activated sludge without significantly affecting the oxygen transfer yield; in an aerated system, the maximum quantity of dissolved oxygen is 2-3 mg/liter. A pure oxygen system can achieve a 90-95% utilization of the dissolved oxygen compared to 5-6% in an aerated system. The success of a pure oxygen activated sludge system is based on its capacity to produce oxygen. There are two oxygen production processes, the classic cryogenic process and the molecular sieve adsorption process. The former uses the distilled fraction of air, thus producing liquid oxygen and nitrogen at very low temperatures. While the yield of almost pure oxygen is excellent, the process is complex and only used in large purification plants. The molecular sieve adsorption process is simple, completely automatic, and requires minimal maintenance. Air is pressurized through a sieve containing a granular substance which adsorbs carbon dioxide, nitrogen and water, and lets the residual gas, very rich in oxygen (90%), pass through. The process operates at room temperature and at a fairly low pressure. (Waltner-FIRL)

La Tribune du Cebedeau, Vol 30, No 398, p 2-7, January, 1977. 2 fig, 2 tab, 7 ref.

Descriptors: *Treatment facilities, *Evaluation, *Performance, *Biological treatment, *Lipids, Analysis, Biochemical oxygen demand, Chemical oxygen demand, Detergents, Biodegradation, *Waste water treatment.

Lipids, BOD, COD, detergents, and CH2 content in inflow and outflow were used to estimate the waste water treatment efficiency of a biological discs system. C12 and C18 were dominant compounds revealed by the analysis of the lipidic fraction. These compounds were eliminated to a considerable extent. It was found that the biodegradability of a chemical class is best appreciated when specific parameters are chosen. The time of sampling is more important at the inflow than at the outflow of a plant because mean values are always recorded at the outflow. (Collins-FIRL)

AEROBIC TREATMENT OF LIQUID WASTES--WITH OXYGEN CONCENTRATION MEASURED AND USED TO CONTROL PUMP SPEED USED TO FORCE LIQUID THROUGH VENTURIS.
Netherlands Patent NL 7608-692. Issued February 8, 1977. Derwent Netherlands Patents Abstracts, Vol. Y, No. 8, p D7, April 1, 1977.

Descriptors: *Patents, *Aerobic treatment, *Oxygen, *Pumps, Liquid wastes, Reservoirs, Dissolved oxygen, Sewage effluents, Sedimentation, Equipment, Industrial wastes, Performance, *Waste water treatment.

A patent was issued for an aerobic treatment process for liquid wastes. The waste flows through a reservoir and a portion is removed and reinjected, with added air, into the reservoir. This creates a horizontal aerated liquid flow. A device, sensitive to the liquid oxygen concentration, controls the speed of the pump which forces the liquid through the ejectors to maintain a determined dissolved oxygen level. Liquid from the reservoir flows out and up through tube settlers above the level of the ejectors. The process may be applied to sanitary and industrial waste liquids. Power needs are lowered and a maximum efficiency is obtained. (Collins-FIRL)

MECHANICAL SURFACE AERATOR FOR EFFLUENT PURIFICATION--HAS THE LIQUID SCOOPED BY THE CURVED ELEMENTS AND EJECTED INTO THE AIR ABOVE,
P. N. Chumachenko, G. I. Papkov, and V. F. Kostenko.
Soviet Patent SU 508-485. Issued August 6, 1976. Soviet Inventions Illustrated, Vol. Y, No. 9, p D3-D4, April 12, 1977. 1 fig.

Descriptors: *Patents, *Aeration, *Equipment, Water purification, Performance, Domestic wastes, Industrial wastes, Oxygen, Liquid wastes, *Waste water treatment.

A patent was issued for an aerator to be used in the biochemical purification of water. The device consists of a vertical shaft with curved elements mounted at angles to each other, and a mechanical drive. Inlets and outlets are placed about the rotational direction of the shaft. Rotation of the elements occurs as the liquid passes through. The liquid is then ejected into the air above the liquid level for aeration. This saturates the liquid with oxygen; additional mixing and aeration take place on the side plane of the curved element. Aeration effectiveness is very independent of level variations in the aeration tank. (Collins-FIRL)

SLUDGE COLLECTOR AND LIGHT LIQUID, SEPARATOR--FROM SEWAGE WITH TWO TANKS IN SINGLE HOUSING AND COVER.
French Patent FR 2309-677. Issued December 31, 1976. Derwent French Patents Abstracts, Vol Y, No 9, p D9, April, 1977.

Descriptors: *Patents, *Sludge treatment, *Liquid wastes, *Equipment, Oil wastes, Pumps, Sewage effluents, Water reuse, *Separation techniques, *Waste water treatment.

A patent was issued for a process to collect sludge and to separate settled materials from light liquids. The apparatus is installed in a common covered housing. Contaminated water enters the inlet and settled material is placed in the collector as the liquid moves over the overflow and under a partition into the separator. Light materials float upwards and water passes under the partition. A pump evacuates buildups of separated matter. Light liquids are removed through one pipe and sludge through another. Water is recycled for jet injection to break up the floating light materials; the collector and separator are washed by water. Separated materials can be removed by a pump as needed. (Collins-FIRL)

CLEANING OF SEWAGE SLUDGE SYSTEM.
Australian Patent 480,414. Issued February 17, 1977. Australian Official Journal of Patents, Trade Marks, and Designs, Vol 47, No 5, p 387, February, 1977.

Descriptors: *Patents, *Sludge treatment, *Cleaning, Pumps, Piping, Separation, Oxidation, Heat exchangers, *Waste water treatment, Equipment, *Sewage sludge.

A patent was issued for a sludge system cleaning process. The process involves a high pressure pump connected to a sludge source, and piping from the pump to a heat exchanger, a reactor, a separator, and an oxidized sludge tank. A cold water source separated from the sludge source has a separate pipe leading to the pump. The sludge line to the pump is closed and the cold water line is opened. The cold water is directed through the heat exchanger, by-passing the reactor, to isolate the hot reactor contents from the system. Afterwards, the cold water line is closed, the sludge line is opened, and the reactor is returned to the system. Sludge blockage is removed by cold water flowing through the heat exchanger in the reverse direction of sludge flow during normal operation. The blocking material is flushed through a previously closed drain line. (Collins-FIRL)
W77-08561

SCREENING APPARATUS FOR REMOVAL OF SOLIDS--FROM SEWAGE WITH ROTATING SCREEN AND VERTICAL LIFT FOR RESIDUES.
French Patent FR 2308-599. Issued December 24, 1976. Derwent French Patents Abstracts, Vol Y, No 8, p D5, April, 1977.

Descriptors: *Patents, *Separation techniques, *Solid wastes, *Filtration, Equipment, Sewage effluents, Mechanical engineering, Sewage treatment, *Waste water treatment, Waste treatment.

A patent was issued for a screening apparatus to remove solids from sewage. Sewage flows through a cylindrical screen with a vertical axis and solids are retained on the external face, separating them from the flow. The screen is either fixed or rotated by motor. A second screen, of vertical rods, is located to the side of the first one. The rods extend above the level of flow and a hydraulic ram moves a lifting plate up and down. This plate colleects solids which remained on the second screen and pushes them into a compression chamber. The first screen has scraper and the process is continuous. (Collins-FIRL)

BOC BLOWS BUBBLES IN DIRTY BATH WATER,
B. Appleton.
New Civil Engineer, No 229, p 19, February, 1977.

Descriptors: *Sewers, *Oxygen, *Sewage effluents, *Biological treatment, Biochemical oxygen demand, Capital costs, Oxygenation, Sedimentation, Suspended solids, Temperature, Flocculation, Performance, Filters, *Waste water treatment, Injection.
Identifiers: Effluent quality control.

The British Oxygen Company (BOC) and the Wessex Water Authority have developed an oxygen injection system for sewers which improves final effluent quality by 30-60%. Previously used for hydrogen sulfide control, oxygen injection in this application can reduce capital expenditures. Microbial activity is induced in the final sewer section to reduce BOD of raw sewage. Biological treatment is enhanced as is the settleability of the oxygenated sewage. An injection rate of 45 kilograms/hour produced a small residual dissolved oxygen concentration at the delivery end of the main and improved the final effluent to 21 milligrams/liter of suspended solids and 19 milligrams/liter of BOD. Flocculation is improved, and filter performance is greatly enhanced by the reduced biological loading. Pump efficiencies, however, were decreased by an average of 8% because of a delay in reaching steady-state conditions. Performance was reduced in winter due to the temperature-sensitive biological activity in the sewers, but it was within the effluent ranges required. (Collins-FIRL)
W77-08564

MICHIGAN TREATMENT PLANT ACHIEVES ZERO DISCHARGE, IRRIGATES CROPLAND,
Water and Sewage Works, Vol. 124, No. 3, p 42-44, March, 1977. 2 tab.

Descriptors: *Tertiary treatment, *Treatment facilities, Domestic wastes, Industrial wastes, Oxidation lagoons, Irrigation, Lakes, Organic matter, Nutrients, Flow, Crops, Growth rates, Soil types, Biochemical oxygen demand, Maintenance, Costs, *Waste water treatment.
Identifiers: Paw Paw(MI), Zero discharge.

Paw Paw, Michigan, has built a sewage treatment plant which has met the EPA goal of zero discharge by 1985. The community treats domestic and industrial wastes in facultative lagoons, then retains it in an artificial lake up to six months. The final wastes are applied as crop irrigation water. There is no bulk sludge to handle since almost all organic substances are naturally reduced. Revenue estimates for the irrigation program have been as high as $450 per acre. The water is rich in nitrogen, phosphorus, and other nutrients. Sanitary sewers are tightly sealed from community storm sewers. Domestic flow averages 0.39 mgd and industrial flow averages 0.16 mgd. This system has provided 95-98% BOD removals and 80-89% suspended solids removals. System design is for a discharge of2-3 inches per week for the entire treatment area, but flows are to be changed in consideration of soil types, natural rainfall, and the growth stage of each crop. The system was designed to absorb shocks and has treated BOD loadings of 7500 pounds without trouble. It was designed to handle a 4000 pound BOD loading. The system quickly dispels odor problems. Maintenance requirements and operational costs are reasonably low. (Collins-FIRL)
W77-08565

HIGH CAPACITY WASTE WATER TREATMENT SYSTEM,
Mixing Equipment Co., Inc., Rochester, N. Y.
Paper Trade Journal, Vol. 161, No. 2, p 46, March, 1977. 1 fig.

Descriptors: *Waste treatment, *Activated sludge, Equipment, *Aeration, Biochemical oxygen demand, Suspended solids, Nitrification, Phosphorus, Chemical treatment, Concrete construction, *Waste water treatment.
Identifiers: *Lightnin treatment system.

The Lightnin high capacity treatment system was introduced in the United States from Canada. For activated sludge applications, a mechanical aerator, surface or submerged, produces a flow to recycle settled sludge from an integral clarifier. The process handles flows from thousands to millions of gallons per day, and easily handles biological shock loads. It features common wall concrete construction and satisfied BOD and solids regulations for secondary treatment at wide BOD loading ranges and concentrations up to 3,000 milligrams/liter. The process can operate at MLSS concentrations of 2,000-12,000 milligrams/liter or higher. Phosphorus is removed by adding chemicals directly to the aeration basin and nitrification is easily achieved. There are minimum sludge handling costs, no submerged diffusers have to be cleaned, and there are no underwater bearings on the clarifier mechanism. (Collins-FIRL)

TRENDS IN SMALL SEWAGE TREATMENT PLANTS,
Treatment Plant Contracts Ltd., Hounslow (England).
O. A. Goulden.
Effluent and Water Treatment Journal, Vol. 17, No. 1, p 37-38, January, 1977.

Descriptors: *Treatment facilities, *Septic tanks, *Aeration, Tertiary treatment, Municipal wastes, Domestic wastes, Economics, *Waste water treatment, Filtration, Biological treatment, Legislation, Costs.
Identifiers: *Great Britain.

Developing trends in small sewage treatment plants were delineated for the British nation. Six trends are of major importance. These include a growing septic tank market, the requirement of many water authorities that filter beds be used as well, a rise in maintenance costs, the increase in sophisticated treatment systems, the failure of various 'high technology' aeration tanks to produce capital and operational cost savings, and new sewage rates introduced by the government. These trends have become important because of the assumption that Britain would benefit from small privately owned plants in many ways. They are economical and produce multiple discharges of treated effluent into subsoils rather than a massive outfall from a major septic tank and filter bed and soakaway. Various economic considerations would require that treatment plants have a life of 30 years or more. This is not yet true of advanced treatment plants. A septic tank plus filter bed and soakaway for up to 15 people, and a biological filter bed for 15-1000 people fulfills this requirement. A full-time attendant and advanced technology are valid for installations for more than 1,000 people. This appears to be the best program until operational and maintenance costs for advanced treatment facilities can be achieved. (Collins-FIRL)

CHLORINE COMBINING WITH SEWAGE,
Water and Waste Treatment, Vol. 20, No. 2, p 18, February, 1977.

Descriptors: *Chlorination, *Sewage treatment, Treatment facilities, Toxicity, Bacteria, Disinfection, Industrial wastes, Pollution abatement, Monitoring, *Waste water treatment, Chemical reactions, Analysis, *Chlorine, *Polychlorinated biphenyls, Canada.
Identifiers: *Chlorinated biphenyls.

The Ontario Ministry of the Environment is investigating the possiblility that toxic substances are being created from the chemical reaction of industrial wastes and the chlorine used in sewage treatment. The formation of chlorinated biphenyls can be an especially serious problem. Laboratory tests have produced these substances in ways which might be similar to what occurs during sewage treatment, but there is no evidence of chlorinated biphenyl production under actual conditions. PCB levels in the area of 40 sewage treatment plants have been monitored for two years, because of their potential cumulative risks. The production of chloroform is another worry of those concerned about chlorine treatment. The production of such toxic or carcinogenic agents has been a theoretical drawback to the extremely beneficial use of chlorine for seage and drinking water. To avoid the possible dangers of using chlorine, ozone is being considered as an alternative treatment method. (Collins-FIRL)

KOWLOON SEWAGE TREATMENT AND DISPOSAL,
Effluent and Water Treatment Journal, Vol. 17, No. 2, p 94, February, 1977.

Descriptors: *Sewage treatment, *Sewage disposal, Water pollution sources, Pollution abatement, Industrial wastes, Domestic wastes, Design, Treatment facilities, Piping, Separation, Equipment, Planning, Urban areas, Asia, Waste water treatment.
Identifiers: *Hong Kong.

Various feasibility studies and investigations were conducted by the Hong Kong Government to develop treatment schemes as alternatives to ocean disposal of sewage and industrial wastes. A two-year study included float tracking and current measurement; determination of salinity and water temperature; and evaluation of the extent of pollution as expressed by dissolved oxygen levels and coliform bacteria counts. Sediment and bottom mud conditions were also studied. Design studies were conducted to develop treatment facilities in various areas of Hong Kong. Development will be carried out in two stages, at a cost of HK$520 million. A facility for North West Kowloon was suggested with interception of sewage and industrial wastes and conveyance by underwater pipeline to a treatment works on reclaimed land. The treatment works will have a main pumping station, and facilities for grit removal and fine screening. Screening and degritted sewage will be discharged by a new outfall and diffuser to the main harbor current stream. Added stages will include another interceptor and sewage and sludge treatment. Construction will have to survive typhoons and be such that shipping activities and harbor traffic will not be interruped. This will probably be achieved by enclosing trunk sewers in immersed tubes. The completion of stage one is projected for 1980. (Collins-FIRL)

SEWAGE WORKS IS ABOVE GROUND LEVEL,
Water and Waste Treatment, Vol. 20, No. 2, p 13-14, February, 1977.

Descriptors: *Treatment facilities, *Sewage treatment, Costs, Flows, Industrial wastes, Water districts, Design, Piping, Corrosion control, Monitoring, Engineering structures, *Waste water treatment, Construction.

Normanton, Yorkshire, England, has replaced an inadequate treatmnet plant with one using the latest techniques. A regional facility, to handle increased industrial and housing development, is being constructed in two phases. The completed facility will be able to handle sewage for a population of 58,000, and would cost about 3.5 million pounds. Differences from other advanced systems include the pumping of all flows to the head of the works, and above ground treatment units. The sedimentation tank water level is about 3 meters above ground, allowing all associated pipe work to be placed in a covered gallery on the hipper end of the tank. This protects the pipes from the environment and provides workmen with a good work area. The piping is of ductile iron and flanged design. The versatility of this piping allowed the creation of a neat and endurable pipe system immune to accidental damage and extremely reistant to internal corrosion. Push-button operation of the de-sludging valves aid checking of sludge consistency through a sight glass. Sedimentation tank feed ports are designed to diffuse the flow an entry to establish early solids settling. These ports are made of glass-fiber reinforces plastic to ensure a long trouble-free life. (Collins-FIRLL)

OXYGEN SYSTEM ACTIVATED SLUDGE PROCESS.
Effluent and Water Treatment Journal, Vol 17, No 2, p 83, February, 1977. 1 fig.

Descriptors: *Oxygenation, *Sludge treatment, Aeration, *Activated sludge, Aerobic conditions, Oxygen, Gases, Oxygen demand, Design, Suspended solids, Treatment facilities, *Waste water treatment, Tertiary treatment.
Identifiers: *UNOX system.

Development of the UNOX activated sludge treatment process has eliminated many of the drawbacks of traditional activated sludge treatment. The negative aspects included the need for large aeration tanks and land areas, odor problems from open tanks, and rapid effluent quality declines at loadings greater than design. Most of the problems were traced to a shortage, or transient shortage of dissolved oxygen. The use of pure oxygen provides a healthier, more efficient process. The UNOX system uses about 90% of the oxygen gas fed into it. This gas and activated sludge and sewage are contacted in multi-stage reactors. A near four-fold efficiency increase resulted from the use of pure oxygen. On-site oxygen supply can be accomplished by a pressure swing adsorption oxygen generator. The process maintains a DO of 2-8 milligrams/liter, creating an optimum environment for activated sludge. This allows the system to operate at high mixed liquor suspended solids concentrations with a more active biomass per unit volume. Because of this, retention times can be 25-50% less than in conventional plants. The system can easily respond to changes in load and can be adapted to existing activated sludge systems. Sludge production is less and can be treated for direct application to land. The plant requires less land than conventional systems and avoids most of the objectional features of them. (Collins-FIRL)

TRAVELLING GRATE-TYPE FILTRATION SYSTEM USES PULVERIZED COAL TO LOWER BOD OF WASTEWATER.
Water and Pollution Control, Vol 115, No 3, p 38, March, 1977.

Descriptors: *Filtration, *Biochemical oxygen demand, *Coal, Equipment, Organic matter, *Waste water treatment, *Filters, Suspended solids, Liquid wastes, Heavy metals.

A traveling grate-type filtration system was developed to lower BOD loads of organic pollutant waste water, using pulverized coal. BOD is reduced to under 2 ppm and heavy metal ions are reduced by more than 90%. A revolving cylinder serves as the settling tank. Waste water and precipitation accelerators are introduced at the same time. Waste water passes from the bottom opening of the tank to a sump tank and then to the coal filter bed. After pollutant absorption, the coal is removed for disposal by a rake arm, along with suspended solids and other contaminants which settled out of the waste stream. Treated water is fed to a sprinkling filter bed for biochemical treatment to lower organic content. (Collins-FIRL)
W77-08577

PROSPECTS STRONG FOR WASTE WATER OXYGENATION,
W. J. Storck.
Chemical and Engineering News, Vol 55, No 13, p 17-18, March, 1977.

Descriptors: *Oxygenation, *Waste water treatment, *Treatment facilities, *Aeration, Oxygen, Biochemical oxygen demand, Municipal wastes, Sludge, Costs, Equipment.

Oxygen aeration of waste water is becoming more attractive as waste water treatment is more strictly regulated. It can double treatment capabilities without necessitating a vast expansion of facilities. In addition, it could provide greater BOD removal, sludge digestion, and nitrification. There is the promise of greater removal efficiencies with lower operating costs than air aeration, though capital costs are greater. However, a section of P.L. 92-500 calls for 75% federal financing of eligible capital costs, and some state governments offer various subsidies. Oxygen aeration systems reduce air pollution in the form of odors and virus contaminants. Sludge disposal problems are reduced by the production of a denser, low-volume sludge. Improvements in oxygen production and modular construction are also considered to be advantages of this system. (Collins-FIRL)

EFFLUENT EMPHASIS UNDERLINES ENVIRONMENTAL EFFORT AT ENPOCON,
R. Wood.
Environmental Protection Survey, p 11-13, February, 1977. 3 fig.

Descriptors: *Water purification, Liquid wastes, *Flotation, *Aeration, *Electrolysis, *Chlorination, *Flocculation, *Oxygenation, Oxygen, Pumps, Waste disposal, Equipment, Incineration, Sludge disposal, Pollution abatement, Polymers, Chemical treatment, Gases, *Waste water treatment.

Various waste effluent treatment methods were demonstrated at an English exhibition. A packaged dissolved air flotation plant was shown which was fabricated of steel to eliminate the time, costs, and land usage required for concrete tanks or lagoons built on site. The effluent is pumped from a wet well to a holding tank, with air introduced upstream from the pump. The air is in solution until it reaches the flotation cell in the coagulation chamber where it is released as tiny bubbles. The resultant float is removed by a scraper arm and placed into a sludge hopper. The effluent is removed and recycled. A system employing electrolytic treatment with flotation was claimed to reduce operating costs by as much as 50% when compared with air flotation. Chlorination units were also displayed. There was an 8,000 ppd liquid chlorine evaporator and a high capacity chlorinator, as well as one based on the use of solid tablets of a mixture of calcium hypochlorite and 1,3,4,6 tetrachloroglycoluril. A pure oxygen waste water treatment system and a submersible aerator were other units shown. Solutions to disposal problems were seen in a thermal sludge drying system which produced a pelletized material, and in incineration unites. (Collins-FIRL)

SEWAGE SLUDGE DISINFECTED BY ELECTRON-BEAM BOMBARDMENT.
Compost Science, Vol. 18, No. 1, p 24, January-February, 1977.

Descriptors: *Sludge treatment, *Disinfection, *Irradiation, Heavy metals, Sludge disposal, Equipment, Bacteria, Viruses, Treatment facilities, *Waste water treatment, Sewage sludge, Water treatment.

An irradiation process was developed for the disinfection of sludge. Greater restrictions on sludge disposal have spurred interest in this sludge treatment for the destruction of odor, bacteria, and viruses. Electron-beam bombardment is being tested by the Massachusetts Institute of Technology and the University of New Hampshire at a Deer Island, Massachusetts, facility. Sludge water with 2-5% solids is treated in a 4 foot-wide, 2 millimeter-deep stream. This facility treats 100,000 gallons of sludge per day. A commercial facility equivalent to the test facility would require an initial investment of $500,000 and an annual operating budget of nearly $130,000. (Collins-FIRL)

1.17 MILLION (POUND) WORKS AND SEWAGE SCHEME COMPLETED AT MARKET RASEN.
Surveyor, Vol. 149, No. 4423, p 32, March, 1977.

Descriptors: *Treatment facilities, *Sewage treatment, Construction, Pumps, Sedimentation, Filtration, Sludge treatment, Dewatering, Water reuse, *Waste water treatment, Sewers.
Identifiers: Anglian Water Authority(England).

A treatment facility was constructed in England at a cost of 1.17 million pounds. The plant was constructed to handle flows up to 130 liters/second daily. Excess flows are discharged to a river by screw pump. Flows pass through a grit trap, a comminutor, a flow recorder, and then are divided between two sedimentation tanks. The effluent is next divided at the dosing tanks and passed to filter beds where recirculation occurs. Modified alternating double filtration will be added later. After filtration, the effluent is discharged to humus tanks, and finally into a river. (Collins-FIRL)

AUTOMATIC CONTROL OF WHITLINGHAM SEWAGE TREATMENT WORKS NORWICH,
B. L. Thurley.
Process Biochemistry, Vol. 12, No. 1, p 26, 28-29, January/February, 1977. 1 fig.

Descriptors: *Automatic controls, *Monitoring, *Treatment facilities, Sedimentation, Activated sludge, Computers, Flow, Filtration, Sludge treatment, Sludge digestion, Sludge disposal, *Waste water treatment, *Sewage treatment.
Identifiers: Norwich(England).

A digital computer was used to provide automatic control for a treatment facility consisting of existing facilities and 'in construction' extensions. The apparatus controls flow rate through the duty screen and operates a standby screen during Detritor scraper and grit rake operation; it also controls the flow to activated sludge and percolating filter plants, sequences the de-sludging process, and initiates the cleaning of flume float wells. A complete alarm-monitoring program is included in the computer controls. Ultrasonic sensors measure solids content to determine sludge withdrawal during primary sedimentation. Minimum head loss is maintained during activated sludge treatment, as is a predetermined dissolved oxygen concentration. The computer also controls the amount of sludge wasting, and monitors and integrates the amount passed to waste. Computer control is used with the two filtration systems employed: single filtration/recirculation, and single filtration/alternating double filtration. The sludge treatments involved are the automatic feed of sludge to primary digestion tanks, and displacement into secondary digestion tanks and filter pressing. Sludge

FILTERS AND SLUDGE DRYING BEDS,
Water and Waste Treatment, Vol. 20, No. 2, p 35, 38, February, 1977.

Descriptors: *Filters, *Drying, *Sludge treatment, Clay pipes, Sewers, Hydrogen sulfide, Conduits, Temperature, Drainage, Chlorides, Design criteria, Construction materials, Equipment, *Waste water treatment.
Identifiers: *Sludge drying beds.

Naylor Brothers, Limited, in England, has marketed sludge bed floor tiles in the Middle East. The tiles, used for drying sludge, facilitate drainage and help ventilation to aid drying of the under-side of the sludge cake. Cost savings in construction are another advantage because the tiles replace layers of graded media. Filter tiles also aid the drainage of effluent from biological filters and provide basal aeration. Vitrified clay piping is used in the area to reduce hydrogen sulfide formation which can result from high temperatures, and low sewage dilution in sewers, and from flat gradients. These products are resistant to damage from chlorides and sulfates in Middle Eastern soils. (Collins-FIRL)
W77-08586

HISTORY AND DEVELOPMENT OF THE OXIDATION DITCH,
R. S. Denton.
Process Biochemistry, Vol. 12, No. 1, p 3-6, January/February, 1977. 1 fig, 2 tab, 14 ref.

Descriptors: *Oxidation lagoons, History, *Aeration, *Oxygenation, Liquid wastes, Sludge, Biochemical oxygen demand, Equipment, Sewage treatment, Nitrification, Industrial wastes, Domestic wastes, Waste water treatment.
Identifiers: *Oxidation ditches.

The oxidation ditch, developed in 1953, became one of the most satisfactory sewage and industrial waste treatment methods. The system originally operated on an intermittent, fill and draw, principle. Continuous operation systems were later employed, using either a separate final settlement tank or a divided leg, with each section acting as a final settlement tank. This is known as a split ditch. The basic design is a continuous ditch with trapezoidal cross-sections. Oxygenation, circulation, and ditch content mixing is accomplished by aeration rotors. After aeration, the mixed liquor passes to a settlement tank, and the settled sludge is returned to the ditch. At least twice the amount of dissolved oxygen needed for BOD removal is provided, allowing the sludge mineralization and nitrification. These operations are completely mixed systems. High BOD loads are easily absorbed with no adverse effects on effluent quality. The advantages of this treatment method include: the production of a well-stabilized, low-quantity activated sludge but no primary sludge; system flexibility for loads and temperature; low construction and maintenance costs; low noise levels; and easy adaptation to sites. Severe under- and over-loading/aeration, excessive shock loading, nutrient deficiency, and raw sewage septicity and temperature can contribute to problems of poor settling and compaction, or can create an activated sludge with large amounts of filamentous organisms. Incorrect operation will also lead to these problems. An optimal sludge age of 20 days was recommended for operating oxidation ditches. (Collins-FIRL)
W77-08587

MODUFLEX SEWAGE TREATMENT PLANTS PROVIDE THE ANSWER TO GROWTH,
Water and Pollution Control, Vol. 115, No. 4, p 36, 38, 39, April, 1977. 1 fig.

Descriptors: *Treatment facilities, *Design, Water quality control, Water purification, Growth rates, Human population, Equipment, Costs, Design criteria, Capital costs, Concrete construction, Biological treatment, Chemical treatment, *Waste water treatment, *Sewage treatment.
Identifiers: *Moduflex system.

Unpredictable accelerations and decelerations of population growth rates create excessive or less than optimum flows that diminish sewage treatment plant performance. Smaller facilities have a smaller margin of allowable flow variation than larger ones. The Moduflex system was created as a solution to this problem. Modular concrete units can service 5 to 300 homes by progressive enlargement of the plant. Enlargement by unit addition and rearrangement of piping allows continued use of the original installations. The basic system is biological treatment with phosphorus removal, filtration, and nitrogen removal if desired. Unit processes include screening, comminution grinding, activated sludge treatment, chlorination, phosphorus removal by chemical treatment, secondary sedimentation, sludge digestion, and denitrification. When a community needs a full-scale treatment plant, the units may be disconnected, relocated, or sold. The manufacturer will contract to repurchase units, and will provide maintenance and monitoring under contract. (Collins-FIRL)

SODIUM BICARBONATE CAN SETTLE MANY WASTE WATER PROBLEM UPSETS,
Church and Dwight Co., Inc., Piscataway, N.J.
N. Barber.
Pollution Engineering, Vol. 9, No. 4, p 57-59, April, 1977. 1 fig.

Descriptors: *Bicarbonates, *Anaerobic digestion, *Aerobic treatment, Treatment facilities, Hydrogen ion concentration, Methane, Carbon dioxide, Microorganisms, Equipment, Alkalinity, Nitrification, Sedimentation, Physical properties, Chemical properties, Biochemical oxygen demand, Odor, *Waste water treatment.
Identifiers: *Sodium bicarbonate.

Sodium bicarbonate has been used by engineers to prevent equilibrium disturbances in sewage treatment plants, It was used as a buffer to maintain the desired acid/alkali ratio for maintenance of an optimum environment for microbial growth. In anaerobic systems, sodium bicarbonate can control pH, increase methane production, increase biodegradation rates, precipitate toxic metals, and aid solids concentration. It was also substituted for lime and other alkalis in aerobic processes, where it was able to control pH and alkalinity, enhance nitrification, improve BOD reduction, reduce or eliminate odors, enhance settling characteristics, and pretreat industrial wastes. (Collins-FIRL)

ICI EFFLUENT SYSTEM TO BE USED IN ESSEX.
Environmental Health, Vol 85, No 2, p 43, February, 1977.

Descriptors: *Treatment facilities, Domestic wastes, Industrial wastes, Biological treatment, Separation, Economics, Environmental control, Municipal wastes, *Waste water treatment, Costs, Sewage treatment.
Identifiers: *ICI Deep Shaft Effluent Treatment System, Anglian Water Authority(England).

The Anglian Water Authority, England, has approved the construction of a treatment facility using the ICI Dept Shaft Effluent Treatment System. Mixed domestic sewage and industrial effluent will be treated. Completion of the system, involving biological treatment and solids separation stages, is estimated for the summer of 1977. Costs are expected to be about 650,000 pounds. Wastes are circulated in a sunken shaft, treatment is accelerated, space is save, energy needs are reduced, and no odor is produced. Economical installation and a lessened environmental impact are the results of these advantages. (Collins-FIRL)
W77-08590

REMOVING SOLUBLE METALS FROM WASTE WATER,
A. V. Metzner.
Water and Sewage Works, Vol 124, No 4, p 98-101, April, 1977. 2 fig.

Descriptors: *Metals, *Toxicity, *Industrial wastes, Municipal wastes, Pollutants, Waste treatment, Sludge treatment, Water pollution sources, Physical properties, Chemical properties, Recycling, Oxidation-reduction potential, Separation techniques, Sulfides, Chemical reactions, Sedimentation, Filtration, Ion exchange, Membrane processes, *Waste water treatment.
Identifiers: *Soluble metals waste removal.

Soluble metal removal from waste water is necessary before process water can be discharged to municipal sewer systems or recycled. Five basic processes exist for metal removal: chemical oxidation and reduction, precipitation with clarification and/or filtration, evaporation, ion exchange, and membrane processes. Oxidation and reduction may be used to remove chromium and cyanides. Metals can be precipitated either as hydroxides or sulfides. Iron is commonly removed through precipitation. Chemical displacement and granular media filtration are effective treatment methods. Evaporation may be cost efficient, depending on the processing objectives and is useful for metal recovery. Evaporative wastes are crystalline and reduce sludge handling costs. Ion exchange is employed for metal finishing bath purification, demineralization of flows for recycling, polishing effluents following primary treatment, and recovering methods. They, and in particular, reverse osmosis, are used primarily for recycling water and recovering or concentrating solubles. Only 75% of the effluent from this process is a purified product. The remainder must be treated further before discharge. (Collins-FIRL)

THE TRIALS AND TRIBULATIONS OF TREATMENT WORKS IN LOWER TRENT.
Surveyor, Vol 149, No 4424, p 33, March, 1977.

Descriptors: *Treatment facilities, *Performance, *Water quality standards, Sewage effluents, Biochemical oxygen demand, Filters, Biological treatment, Filtration, Humus, Hydraulic design, Dewatering, Sedimentation, *Waste water treatment.
Identifiers: Severn-Trent Water Authority(England).

Investigations into problematic treatment facilities in the Severn-Trent Water Authority district, England, were reported. The first involved a medium-sized works which produced a poor quality effluent. It was found that BOD and suspended solids values were growing worse. The rectangular filter media were large and flat, and surface film growth had developed at the centers only. BOD maxima were found when the distributor was at the ends of the bed. Additional filter capacity was required and suggested remedies included using existing beds in a new filter and replacing the old media with new. Tests are being conducted to determine the effectiveness of these suggestions. The second facility was, again, experiencing difficulties of poor effluent. Hydraulic overloading of humus tanks was the problem. Trial solutions included using storm water tanks as secondary humus tanks, and recirculating the unsettled filter effluent. Both methods were successful. Reduction of hydraulic loads to the humus tanks reduced upward flow rates, improved solids removal, and positively affected settling characteristics of the treated suspension. At another plant, effluent problems seemed to be caused by the use of dewatering concentrators, which treated fibrous materials, on an effluent containing much fine material. Effluent quality improved when a belt press was used to replace the concentrator. (Collins-FIRL)

HORSHAM'S SEWAGE WORKS,
Water and Waste Treatment, Vol. 20, No. 3, p 23, March, 1977.

Descriptors: *Humus, *Filters, *Treatment facilities, Pumping plant, Construction, Dewatering, Construction materials, Concrete, Water purification, *Waste water treatment, *Filtration.
Identifiers: Horsham(England).

A sewage treatment plant is being constructed in Horsham, England, which will include four humus tanks and filter beds. Design capacity is for a population of 95,000. A single wide cutting was made in which the 25.9 meter diameter humus tanks and the ADF pumping station were built. It will be possible to install four additional tanks. A segmented shutter formed the outer ring of the humus tank bases and stiff concrete was used for the sloping bases. The tank walls were made of a steel shutter. Precast concrete was used for the effluent collection channels and the supporting columns. Additional treatment facilities include sedimentation tanks, biological filters, humus tanks, pumping stations, storm tanks, and sludge dewatering equipment. (Collins-FIRL)

PRE-TREATMENT IN THE SEWER,
Water and Waste Treatment, Vol. 20, No. 3, p 15, March, 1977.

Descriptors: *Sewers, *Oxygen, Hydrogen sulfide, Water quality control, *Sewage treatment, Aerobic conditions, Biochemical oxygen demand, Performance, Organic matter, *Waste water treatment, Testing, *Pre-treatment(Water).

Pretreatment of sewage by sewer oxygenation was tested. The Wessex Wat er Authority in England and a supplier of treatment components developed the system which involves the injection of oxygen into sewers at a pumping main. About one ton of oxygen is injected per day to treat aerobic conditions within the sewer in order to allow microbial activity for reducing the organic pollution load. Final effluent was improved by 30-60% after treatment in a plant which exhibited previous overlaoding. Costs for sewer oxygenation were substantially lower than construction costs for added conventional treatment facilities. (Collins-FIRL)
W77-08596

PLANT CAPACITY TO INCREASE,
Public Works, Vol. 108, No. 4, p 108, April, 1977.

Descript : *Treatment facilities, *Oxygen, Performance, *Aeration, *Oxidation lagoons, Water purification, Reinforced concrete, Maintenance, Pumps, Water pollution control, *Waste water treatment, New Jersey.
Identifiers: Wayne(NJ).

A pure oxygen treatment system is being installed at a treatment plant in Wayne, New Jersey, to increase treatment capacity by nearly 80%. A model 100 F30 module is to be placed in two aeration basins. Capacity will be increased from 1 to 1.8 mdg, while only one-third of the existing aeration basin volume will be used. The remaining volume will be used to double the clarification capacity. In the F30 system, a free-fall oxygenation technique creates a turbulence which mixes oxygen and waste water. Oxygen is mixed and dissolved in a turbulent waste water fall zone within a reinforced concrete module. Because the pump is the only moving part, maintenance of the system is minimal. (Collins-FIRL)

OXYGEN INJECTION FOR BATH'S SEWERS,
Water Services, Vol. 82, No. 973, p 129, March, 1977.

Descriptors: *Oxygenation, *Sewers, Water quality, Costs, Testing, Hydrogen sulfide, Aerobic treatment, Biochemical oxygen demand, Temperature, Biological treatment, Microorganisms, *Water purification, *Waste water treatment, *Sewage treatment.
Identifiers: Bath(England).

Bath, England, had been the site of sewer oxygenation testing to investiage the pre-treatment of sewage. The system has effectively improved treatment plant final effluent between 30 and 50%. The works previously operated under a 40% overload. The system, with an injection plant and oxygen, would cost about 19,000 pounds annually, whereas added conventional plant extensions would cost more than 500,000 pounds. With the injection of one ton/day of oxygen at the pumping station, aerobic conditions are created which last throughout the main. This aids microbial activity on sewer walls and in the main body to break down some of the organic pollution load. This load radically changes after primary settlement. Improved settling and sludge treatment have been shown. Summer operation is more effective because of higher temperatures and low river flows. (Collins-FIRL)
W77-08599

HIGHER GAS YIELDS AND REDUCED RETENTION TIMES OBTAINED FROM ANAEROBIC DIGESTER,
Water Services, Vol. 82, No. 973, p 171-172, March, 1977.

Descriptors: *Gases, *Anaerobic digestion, *Sludge treatment, Heat transfer, Water purification, Pumps, Equipment, Filters, Sewage effluents, *Waste water treatment.

A Nash liquid ring vacuum compressor was used to improve the performance of an anaerobic sludge digester at an English treatment plant. The digester, with a capacity of 610,000 gallons, has its contents heated and agitated by units mounted on its exterior wall. Digesting sludge enters the bottom of the heating and mixing units under its own head pressure. Pressurized sludge gas is ued to push sludge up and to inject it back into the digester top. Rising sludge passes through hot water jackets which heat the sludge. Inadequate gas pressure or volume will neither lift the sludge by the required head nor maintain the required flow rates. Heat transfer and/or agitation of the digester contents will thus be negatively affected. This will in turn have a negative effect on sludge digestion and gas production. The liquid ring vacuum compressor was selected because it provides low-cost production of needed pressure and flow rate for good digester operation, reduced maintenance costs and down time with a minimum of wear on parts, and can provide 10 years of trouble-free operation before overhaul is necessary. The unit has provisions for complete shutdown if pressure falls below a pre-set level. Operation may be continuous or automatically controlled. Comparision of two six-month periods, before and after installation, indicated improved operation. Retention time was reduced from 30.5 to 27.6 days even though a 10.8% more slud was handled. Feed sludge solids content and average ambient temperatures varied little. Gas production increased by 6.47% until gas flow meters were installed; afterwards, increases up to 29.9% were recorded probably because of better mixing of the digest contents. This pump can also be applied to rotary vacuum filters and can be used to supply oil-free air for sub-surface aeration needs. (Collins-FIRL)

SEABED SEWERS FOR HONG KONG,
Watson (J. D. and D. M.) (Hong Kong).
A. F. Short.
The Consulting Engineer, Vol. 41, No. 4, p 47, 50, April, 1977.

Descriptors: *Sewers, *Construction, *Planning, Pollution abatement, Outfalls, Waste disposal, Treatment facilities, Waste water treatment, Tunneling.
Identifiers: North West Kowloon(Hong Kong).

The planned system of submarine interceptor sewers for Hong Kong was described. The system was planned to replace direct discharge to the ocean, which has caused deterioration of beaches and local waters. Rapid population increases and industrial development have made the recommended waste disposal system necessary. Oxygen levels of the city's harbor had been falling below 50% saturation. The proposed scheme uses an interceptor sewer to collect wastes from the three main North West Kowloon drainage areas and convey them to a new treatment site. Treated effluents will be discharged into the harbor's main tidal stream. The interceptor sewer would be a twin circular sewer that crosses the harbor to the treatment site. Interceptor and outfall sewers to the treatment works will be gravity sewers. A main pumping station with degritting and coarse and fine screening facilities will lift sewage to ground level and on to treatment. A high rate biological filtration system with settlement and recirculation is to be employed, and a twin outfall with diffusers will be used for effluent discharge. Sludge treatment will involve heated anaerobic digestion in covered digesters for circulation and gas collection. Sludge disposal will be by ocean dumping. Investigations are continuing for development of underwater construction by tunneling and immersed tube techniques. The treatment facility is to be constructed on reclaimed land and the entire system must be able to withstand the worst extremes on weather, such as typhoons. (Collins-FIRL)

BREAKING DOWN SOLID AND LIQUID WASTE TO FORM A FERTILIZER--BY INOCULATION WITH SELECTED FUNGI AND FERMENTATION.
Netherlands Patent NL 7608-433. Issued February 2, 1977. Derwent Netherlands Patents Abstracts, Vol. Y, No. 8, p D5, April 1, 1977.

Descriptors: *Patents, *Solid wastes, *Liquid wastes, *Fertilizers, *Fungi, *Fermentation, Metals, Aeration, Domestic wastes, Industrial wastes, Microorganisms, Recycling, Waste water treatment.

A patent was issued for a process to transform solid and liquid wastes, which are compressed or comminuted, into fertilizer. Ferrous metals are removed and the material is fermented at room temperature and inoculated with fungus, yeast, or mold. Milling and mixing after inoculation distributes the fungi through the material. It is then placed in a closed aerobic area. This method can be used to treat solid domestic waste and sludge from either domestic or industrial waste water treatment. Various feedstocks may be treated by this process. The resultant product is stable and has properties resembling natural manure. (Collins-FIRL)
W77-08559

SEWAGE DISPOSAL SYSTEM.
Australian Patent 478,238. Issued November 25, 1976. The Australian Official Journal of Patents, Trade Marks, and Designs, Vol 46, No 44, p 4320, November, 1976.

Descriptors: *Patents, *Sewage disposal, Equipment, Waste treatment, Sewage treatment, Hydraulic engineering, *Waste disposal, Mechanical engineering, Waste water treatment.

A patent was issued for a sewage disposal system. It is composed of a main frame positioned at a selected above-ground level with at least one vertical shank secured to it that penetrates the ground to a chosen depth. An underground disposal tunnel is formed by an axially elongate foot attached to a plow at the shank's lower end. Servomechanisms vary the cross-sectional area of the tunnel during operation. A dispensing port is at the end of the flow path for sewage discharge into the tunnel. (Collins-FIRL)

INCINERATION SOLVES TOUGH WASTE PROBLEMS.
Modern Power and Engineering, (Toronto, Canada), Vol 71, No 3, p 40, March, 1977.

Descriptors: *Incineration, *Waste treatment, *Waste disposal, Industrial wastes, Pollution abatement, Municipal wastes, Gases, Combustion, Oxidation, Economics.

Incineration is considered one of the best avenues for handling wastes. Advantages of the method include: weight reduction, volume reduction, sterile residues, and production of recoverable heat. The necessary performance requirements for the application of incineration are an ability to consume a wide variety of materials, adequate pollution controls, compatible operating and capital costs for the system, high disposal capacity per square foot of floor area, and adequate ash residue removal. The operation of a large incinerator for a short time is most economical and disposal of very hazardous materials only is economical for operations below 300 pounds/hour. Air pollution control is often a considerable cost factor. Improved incineration technology includes thermal incineration for gaseous wastes, direct-flame fume incinerators, slagging pyrolysis, and suspension burning of finely divided materials in a vortex furnace chamber. Continued development and design revisions will make incineration a more economically sound treatment method. (Collins-FIRL)

SLUDGE DEWATERING PRESS.
Industrial Wastes, Vol. 23, No. 2, p 17, March-April, 1977.

Descriptors: *Dewatering, *Sludge treatment, Equipment, Sedimentation, Industrial wastes, Municipal wastes, Flocculation, Polyelectrolytes, Waste water treatment, Separation techniques.

Dry-solids cakes can be made with a sludge dewatering press from dilute sludge produced by the sedimentation of industrial and municipal waste water processes. There are three stages: draining of sludge pre-flocculated with a polyelectrolyte; low-pressure pressing of the sludge between the drainage screen and a pressing screen, and pressing by a series of decreasing diameter perforated rollers with increase pressure gradually; and, finally, sustained high-pressure pressing by a series of one inch-wide belts which press the sludge against a perforated roller. (Collins-FIRL)
W77-08581

FLUID BED FOR SEWAGE SLUDGE BURN UP,
D. Martin.
Environmental Protection Survey, p 27, February, 1977.

Descriptors: *Incineration, *Sludge disposal, *Treatment facilities, Sedimentation, Separation, Filtration, Equipment, Oxidation, Sludge treatment, Oxygen, Temperature, Pumps, Dewatering, Pollution abatement, Operation and maintenance, *Waste water treatment, Sewage sludge.
Identifiers: Esher(England).

The sludge incinerator plant at Esher, England, burns organic matter within a fluid bed of sand.

Components of the installation are a mechanically raked screen, a detritor to remove grit, a primary sedimentation facility, biological filters, humus tanks, micro-strainers, and an oil-fired incinerator. Mechanical moving parts are not used so maintenance problems due to mechanical failure are avoided. A fail-safe system is employed to avoid mishaps from power failures. The fluid bed is a mixture of sand and gases in suspension, making an ideal environment for the thermal oxidation of sludge. Flexible feed pipes are used for the sludge to allow easy handling of blockages. Operation is on a continuing rather than batch basis. Dewatering is conducted by vacuum filtration and the pumps are reliable, accept liquid carryover and soft solids, are resistant to corrosion, have a cooling effect on explosive gas, and scrub dirty gas. Little maintenance is required for the pumps. The plant has lower odor levels than usual, clean stack gas, and an absence of ash. (Collins-FIRL)
W77-08582

TRENCHING SLUDGE MAY BE SAFE.
Water and Wastes Engineering, Vol 14, No 4, p 17, April, 1977.

Descriptors: *Sludge disposal, *Trenches, Water pollution, Treatment facilities, Testing, Nitrogen, Heavy metals, Sludge digestion, Cadmium, Copper, Nickel, Zinc, Lead, Chlorides, Nitrates, Ammonium compounds, Waste water treatment.

Experiments involving the trenching of sludge have revealed no significant groundwater contamination. Digested and undigested sludge was placed in two-foot deep trenches. The levels of nitrate, chlorides, and ammonium were not considered hazardous. Sludge trenching is being used by the Washington Suburban Sanitary Commission, District of Columbia. Trencing is effective for small plants treating less than one mgd sewage flows or serving cities with 10,000 people. Other tests showed lower nitrogen levels for undigested than for digested sludge. Both sludges had been in trenches for four years. Nitrogen levels for both sludge types were significantly lower after trenching than before the operation. It may be possible for economic savings to result from the elimination of the digestion process since undigested sludge also has lower levels of heavy metals than digested sludge. (Collins-FIRL)

APPARATUS FOR CONTINUOUS LIQUID-LIQUID EXTRACTION OF WATER WITH A SOLVENT,
Aktiebolaget Tellusond, Goteborg (Sweden). (Assignee).
B. O. Josefsson, and M. Ahnoff.
U.S. Patent No. 3,996,140, 5 p, 4 fig, 9 ref; Official Gazette of the United States Patent Office, Vol 953, no 1, p 284, December 7, 1976.

Descriptors: *Patents, *Chemical wastes, *Water treatment, *Water pollution treatment, Water quality control, *Separation techniques, Organic compounds, Polychlorinated biphenyls, Solvents, Solvent extraction, *Waste water treatment.

The increasing concentration of chemicals in waterways necessitates substantially continuous supervision of the content of certain chemicals such as oil and chlorinated hydrocarbon, particularly polychlorinated biphenyls (PCB). Since these chemicals occur in very small quantities, it has so far been difficult to develop a sufficiently reliable and robust apparatus suitable for operation at a sampling point in waterways or at sea. The object of this invention is to provide an apparatus which can be used for field work. It should also be possible to use the apparatus immersed below the surface of the water for separation in situ. The apparatus for extracting dissolved substances from water comprises an extraction vessel. A mixing container, open at the top is placed in the lower portion of the extraction vessel and contains stirring means. The extraction vessel contains a desired quantity of solvent. The water is added in a continuous flow and is mixed with the solvent. The lighter solvent phase rises to the top of the apparatus, while the heavier water phase is continuously withdrawn through an annular space between the mixing container and the wall of the extraction vessel. FLUORIDE ANALYSIS OF WATER-TREATMENT-PLANT SLUDGES,
Auburn Univ., Ala. Dept. of Civil Engineering.
W. H. Duke.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-268 091, Price codes: A04 in paper copy, A01 in microfiche. Master of Science Thesis, December 1974, 62 p, 10 fig, 5 tab, 47 ref, 1 append. OWRT A-043-ALA(1).

Descriptors: *Sludge, *Fluorides, *Measurement, Dilution, *Distillation, Distribution system, *Water treatment, *Aluminum, Treatment facilities, Pollutant identification.
Identifiers: Rapid mix, *Fluoride analysis.

A method for fluoride analysis of sludges was developed and verified using laboratory-prepared alum sludge. The developed method was then used to measure fluoride concentrations in sludges from selected water treatment plants. Inititally, three methods of fluoride measurement were considered: the alizarin visual method, the SPADNS method, and the electrode method. Since none of the methods was directly applicable to the determination of fluoride in sludge, several modifications were made. These modifications included dilution, acidification and distillation. Pretreatment of the sludge sample by distillation and the analysis of the fluoride content of the distillate by the conventional electrode method was determined to be a valid method for measuring fluoride concentrations in sludges. The effects on the distillation process of aluminum accumulation in the distillation reagent, the size of the sample to be distilled, and the aluminum concentration in sample were investigated. An aluminum accumulation of less than 184 mg and an aluminum concentration in the sample of less than 300 mg/l were determined not to interfere with fluoride recovery. A 100.0 ml sample size was also determined to yield the best results. Sludge samples from water treatment plants in which fluoride is added in the rapid mix and sludge samples from water treatment plants in which fluoride is added following filtration were analyzed for fluoride. The addition of fluoride in the rapid mix results in high fluoride concentrations in the sludge and an aluminum carry-over to the distribution system.

R. C. Cooper.
Journal of the Environmental Engineering Division-ASCE, Vol. 103, No. EE1, p 37-47, February, 1977. 2 tab, 45 ref.

Descriptors: *Water reuse, *Public health, Toxicity, Bacteria, Viruses, Animal parasites, Chemical wastes, Inorganic compounds, Organic compounds, *Tertiarytreatment, *Waste water treatment, Water treatment.

Hazards to human health which might result from the reuse of highly treated waste effluents have two major sources, biological agents and chemical agents. These biological agents may be bacterial, viral, or parasitical in nature. Salmonella and Shigella are the most important enteric pathogenic bacteria encountered. Enteroviruses, adenoviruses, reoviruses, and the agent of infectious hepatitis are potentially the most important viruses involved. Many intestinal parasites are associated with waste water but the incidence of their occurrence is not well established. Inorganic or organic chemical agents may be either acutely or chronically toxic to populations. The analysis of chemical agents is more difficult, and they arise from a wider range of sources than biological agents. They are both natural and man-made. Another problem is the uncertainty concerning the fate of chemicals in water, which depends upon their stability and their biotransformation to more toxic forms. Other concerns involve the effects of water hardness and the impact of trace organics. Developments in analysis, epidemiologic studies, and treatment must become more definitive before extensive waste water reuse can be applied with guarantees of health safety. (Collins-FIRL)

APPLICATION OF CORRUGATED SHEET SPRAYERS FOR WATER PURIFICATION (DIE ANWENDUNG VON WELLBAHNRIESLERN IN DER WASSERAUFBEREITUNG),
G. Nagel.
GWF-Wasser/Abwasser, Vol 118, No 3, p 103-109, 1977. 14 fig, 1 tab, 4 ref.

Descriptors: *Water purification, *Aeration, *Spraying, Iron, Manganese, Separation, Performance, Oxygen, Carbon dioxide, Gases, Equipment, Pollutants, *Water treatment, Water quality control, Waste water treatment.
Identifiers: *Corrugated sheet sprayers.

Results are presented of field experiments with corrugated sheet sprayers used to aerate raw potable water for the removal of iron and manganese. At an air-to-water ratio of 1:1, optimal results were obtained at flowthrough rates of 600-1,000 cu m/hr per sq m. The new process has the advantage of

providing for adequate oxygen concentration in the water without causing supersaturation or excessive loss of CO2. This is because the water passes through a special degassing section after going through the aeration section. Test runs for several months showed no clogging in spite of considerable iron and manganese concentrations of up to 2.8 mg/l and 0.5 mg/l, respectively. (Takacs-FIRL)

5G. Water Quality Control

REORGANIZING POLLUTION CONTROL IN THE U.K.
Wessex Water Authority, Bristol (England).
R. Toms.
Water Spectrum, Vol 8, No 1, p 23-28 (Spring-Summer 1976). 1 map, 2 chart, 8 photo.

Descriptors: *Pollution abatement, *Water quality control, Foreign countries, *Research facilities, Organizations, Population, Water supply, Sewage treatment, Waste treatment, Biological treatment, Effluents, Management, Tidal waters, Rivers, Sampling, Water policy, Water demand, Eutrophication, Inspection.
Identifiers: Corporations, Centralization, *United Kingdom, *Wessex Water Authority(Eng).

The United Kingdon reorganized its total concept of pollution control under a new corporate management image in 1974. The Water Act of 1973, which became effective April 1, 1974 established a Welsh National Water Development Authority and nine regional water authorities to cover all of England. The act combined wastewater collection, sewage treatment, river and water resources management, treatment and supply of public and industrial water, and included fisheries and water recreation as integrated components of a comprehensive management system under the control of a single authority. The 1974 Control of Pollution Act extends the powers of the regional authorities to all discharges into estuaries and the sea, and from boats. All consents, details of samples and any subsequent action taken by a water authority will be made available for public scrutiny. The quality of water supplies has been given a high priority. Water research has been taken over by the newly formed Water Research Centre. Although the improved coordination possible under this new corporate management structure already appears to be more effective, several more years will be necessary to complete the settling out process. (Martin-Florida)

STANDARDS OF PERFORMANCE AND PRETREATMENT STANDARDS FOR THE EXPLOSIVES MANUFACTURING POINT SOURCE CATEGORY (PROPOSED RULES),
Environmental Protection Agency, Washington, D.C.
Federal Register Vol 41, No 47, p 10186-88, March 9, 1976.

Descriptors: *Explosives, *Federal Water Pollution Control Act, *Industrial wastes, *Effluents, *Water quality standards, Water pollution, Discharge(Water), Legislation, Administrative agencies, Regulation, Governments, Management, Monitoring, Water policy, Water pollution control, Water pollution sources.
Identifiers: *Environmental Protection Agency(EPA), *National Environmental Policy Act, *Point source discharges, *Manufacturing operations, Effluent limitations, Effluent guidelines.

Under the Federal Water PollutionControl Act (FWPCA), the Administrator of the Environmental Protection Agency (EPA) is required to establish effluent limitations and guidelines for existing sources of effluents, standards of performance and pretreatment standards for new sources, and pretreatment standards for existing sources, by certain dates as set by the Act. The Act requires that as of July 1, 1977, the effluent limitations for point source discharges must be within standards achievable for the best practicable control measures and practices as defined by the Administrator pursuant to section 304(b) of the Act. This proposed rule deals with both military and commercial explosives manufacturing point source discharges. Standards of performance are proposed for the manufacture of explosives subcategory under Subpart A of the rule and for the explosives load, assemble, and pack plants subcategory under subpart C of the rule. Comments on all aspects of the proposed regulation and suggestions as to alternative approaches that might better satisfy the detailed requirements of the Act are solicited by the EPA. IRRIGATED AGRICULTURE: NONPOINT AND POINT SOURCE WATER POLLUTION,
S. J. Hadeed.
Journal Water Pollution Control Federation, Vol 48, No 9, p 2116-19, September, 1976.

Descriptors: *Agricultural runoff, *Irrigation, *Irrigation efficiency, *Water permits, Irrigation water, Tailwater, Irrigation effects, Surface runoff, Leaching, Salinity, Water conveyance, Water pollution sources, Water conservation, Seepage control, Silviculture.
Identifiers: *Point sources, *Nonpoint sources, *Tailwater recovery.

Irrigated agriculture results in point source pollution (discharges from any conveyance) and nonpoint source pollution (unconfined discharges). The primary cause of nonpoint source pollution is undefined surface runoff from irrigated agriculture. Nonpoint source pollution problems vary from region to region. In the West, leaching causes increased water salinity. In the Central States, feedlot runoff increases water nutrients. The Environmental Protection Agency (EPA) has recently proposed regulations to expand its permit authority over all point sources in concentrated feedlot operations, agriculture and silviculture. Agricultural nonpoint sources are still largely unregulated. The National Commission on Water Quality (NCWQ) has proposed to Congress a series of plan to control irrigation-related water pollution including salinity alleviation projects, better water delivery systems such as lined canals to minimize seepage losses during diversion, and better farm water management techniques such as tail water recovery or recycling to conserve supply and increase water-use efficiency. The EPA studies in the Upper Colorado River Basin show that cost-effective technology is rapidly becoming available to control pollution from irrigated crop production. (Denker-Florida)

OPERATION AND IMPACT OF NPDES IN REGION II, PART I,
Environmental Protection Agency, New York. Caribbean Construction Grants Branch.
W. J. Muszynski, and T. J. Olenik.
Water and Sewage Works, Vol. 123, No. 5, p. 62-65, May, 1976, and No. 6, p. 93-95, June, 1976.

Descriptors: *Federal Water Pollution Control Act (FWPCA), *Legislation, *Permits, *Municipal wastes, *Discharge(Water), Regulation, Legal aspects, Water treatment, Water law, Effluents, Political aspects, Pollutants, Discharge(Water), Financial feasibility, Administration, Water policy, Grants, Government finance, Economics, Treatment, Sewage treatment, Financing, Governmental interrelations.
Identifiers: *Federal Water Pollution Control Act Amendments of 1972, National Pollution Discharge Elimination System, Combined flow, Economic impact, Sewage management, Municipal dischargers.

In establishing the National Pollutant Discharge Elimination System (NPDES) permit program Congress has created an instrument for enforcement of the Federal Water Pollution Control Act (FWPCA) Amendments of 1972. In Region II, one of the largest and most important sections in terms of municipal dischargers, problems encountered by NPDES have centered around the funding issue, the pretreatment of industrial wastes, combined flow, and the lack of discharge information. To qualify for a permit, an existing treatment plant must meet standards dictated by the Environmental Protection Agency (EPA). These requirements are generally more stringent than previously required under state programs. Some provisions, however, are made for issuance of permits with special conditions for plants that do not meet current standards. The NPDES program has had significant economic impact, illustrated by reference to specific cases. From the study of Region II, it is apparent that many municipal dischargers will not meet the July 1, 1977 deadline. However, the success of the NPDES program should not be measured strictly in terms of this deadline. Instead the program should be judged by its effect on the grant program, increased efficiency of existing plants, and the collection of more reliable data. (Petruff-Florida)

FEDERAL WATER POLLUTION CONTROL ACT AMENDMENTS OF 1972 REACH POLLUTING ACTIVITIES OCCURRING ABOVE MEAN-HIGH WATER LINE (COMMENT ON U. S. V. HOLLAND).
Florida State University Law Review, Vol 2, No 4, p 799-806, Fall 1974.

Descriptors: *Federal Water Pollution Control Act, *Navigable waters, *Rivers and Harbors Act, *Permits, Wetlands, Tidal waters, Tidal effects, Federal government, Water pollution control, Dredging, Tidal marshes, Judicial decisions, Estuaries, Estuarine environment, Federal jurisdiction.
Identifiers: *Federal Water Pollution Control Act Amendments of 1972, *Fill permits.

The 1972 Amendments to the Federal Water Pollution Control Act (FWPCA) as interpreted by a 1974 case, U. S. v. Holland, give the federal government greater authority to regulate the issuance of fill and dredge permits. First, Holland expands the definition of 'navigable' waters to include 'all waters of the U. S.'. Formerly, under the Rivers and Harbors Act (RHA), fill permits were only required for navigable waters which did not include wetlands, marshes, and small feeder streams. The definition of 'navigable waters' in the Amendments encompasses these bodies. Second, it redefines the boundaries of navigable water. Under the RHA, the boundaries were affixed at the mean average high water mark for coastal waters and the mean high tidal line for bays and estuaries. Under the Holland interpretation the Amendments extend federal authority over water pollution beyond the mean high tidal line to the highest normal tide line. The net effect is that the federal government can now prevent the entry of pollutants into any navigable waters when they are discharged from any point source. The impact of Holland may be limited by the Corps of Engineers' disagreement with the decision, since the Corps is responsible for issuing dredge and fill permits. (Denker-Florida)

TOWARD CLEANER WATER IN THE PACIFIC NORTHWEST AND ALASKA--THE NATIONAL WATER PERMIT PROGRAM.
Environmental Protection Agency, Seattle, Wash. Public Affairs Office.
(1975), 15 p.

Descriptors: *Water permits, *Regulation, *Administrative agencies, *Pacific Northwest U.S., Legal aspects, Water law, State governments, *Alaska, Oregon, Idaho, Pacific coast region, Pacific Ocean, Toxins, Pollutants, Water pollution, Water pollution control, Federal Water Pollution Control Act, Water pollution treatment.
Identifiers: *National Pollutant Discharge Elimination System, *National Water Permit Program, *Federal Water Pollution Control Act Amendments of 1972.

Region X of the Environmental Protection Agency (EPA) produced this pamphlet to inform the citizens of the four states in the region (Alaska, Idaho, Oregon, and Washington) of the functions of the National Pollutant Discharge Elimination System (NPDES), which is referred to as the National Water Permit Program. As part of the Federal Water Pollution Control Act (FWPCA) Amendments of 1972, the NPDES is administered by the EPA in cooperation with state environmental agencies. The program requires that any person or organization discharging pollutants into waters of the United States must have a permit spelling out terms and timetables for the elimination of pollution. Approximately 2500 permits have been issued in the four states since the inception of the program in 1972. As a result, Biochemical Oxygen Demand pollutants are scheduled to be reduced by 85 percent and suspended solids by 63 percent as of 1977. The federal government bears 75 percent of the capital investment for treatment of sewerage facilities; states and communities are responsible for the balance. Industrial waste treatment costs must be borne by the industries themselves. (Sloan-Florida)
W77-08121

FEDERAL CONTROL OVER WETLAND AREAS: THE CORPS OF ENGINEERS EXPANDS ITS JURISDICTION,
W. F. Schneider.
University of Florida Law Review, Vol 28, No 3, p 787-800, Spring 1976.

Descriptors: *Federal Water Pollution Control Act, *Federal jurisdiction, *Landfills, *Navigable waters, *Wetlands, Standards, Permits, Pollutants, Water pollution control, Water quality control, Non-navigable waters, Dredging, Jurisdiction, Federal government, Pollution abatement.
Identifiers: *Interstate commerce, *Fill and dredge permits, National Pollution Discharge Elimination System, Fill operations, Fill permits.

Under the Federal Water Pollution Control Act (FWPCA) it is illegal to discharge any pollution into the waters of the United States without a permit. The responsibility for overseeing the permit system is delegated to the Environmental Protection Agency (EPA). Fill and dredge activities are also included within the scope of the FWPCA since destruction of a waterway can be as environmentally disruptive as pollution. Authority to administer the fill and dredge permit system lies with the United States Army Corps of Engineers. Historically, the Corps' jurisidication has been limited to only navigable waterways but a recent court decision (U. S. v. Holland) removed that limitation. The Holland court did not define 'waters of the United States' but instead held that the commerce clause of the Constitution was the only limitation on the Corps' jurisdictional power. Recent cases have concluded that the Corps' jurisdication extends over wetlands and to the mean high water mark as the boundary for navigable coastal water. In a legal memorandum, the EPA set guidelines for the Corps in implementing the National Pollution Discharge Elimination System (NPDES) permit program. The memo states that EPA will have jurisdiction over all waters affecting interstate commerce. (Denker-Florida)

LET'S HAVE ACHIEVABLE 'SAFE' DRINKING WATER,
Illinois State Environmental Protection Agency, Springfield. Div. of Public Water Supplies.
I. M. Markwood, and V. Randolph.
Water and Sewage Works, Vol 122, No 5, p cover, 4, 89, (May 1975). 1 photo.

Descriptors: *Illinois, *Regulation, *Potable water, *Water quality standards, *Monitoring, Water supply, State governments, Administration, Maintenance, Design, Economic impact, Water, Water purification, Water treatment, Legislation, Public health.
Identifiers: *Administrative regulations.

The State of Illinois strongly favors legislation which will assume safe drinking water. Finding that certain aspects of the proposed interim primary regulatons will interfere with progress toward that goal, the State opposes those aspects. The regulations are deficient in three general areas: (1) the classification of all water supplies under the same requirements; (2) reliance on monitoring alone to determine whether a water system is safe; (3) failure to leave monitoring administration to the state's discretion. Illinois believes regulations should depend more on design and maintenance than on monitoring. In addition, the economic burdens imposed on many small businesses to achieve a standard equal to public water supplies is unfair. Furthermore, the state feels that the value of the testing requirements must be weighed against the economics of taking the test in order that the best use will be made of the money available for upgrading water supplies. (Rieck-Florida)

PL 92-500: PHOENIX V. THE EPA,
Arizona State Water and Sewer Dept., Phoenix.
A. F. Vondrick.
Water and Wastes Engineering, Vol 12, No 6, p 52-54, 58, 60 (June 1975).

Descriptors: *Municipal wastes, *Federal Water Pollution Control Act, *Arizona, *Pre-treatment(Water), Waste water(Pollution), Construction, Discharge(Water), Industries, Industrial wastes, Coliforms, Local governments, Treatment facilities, Municipal water, Regulation.
Identifiers: *Effluent limitations, *Construction Grant Program, *Discharge Permit Provisions, Industrial cost recovery, Phoenix(Ariz).

Municipal conflicts with federal bureaucracy in striving to accomplish pollution control have become classic confrontations. Phoenix, Arizona, for example, is caught in a web of frustration created by the directives of the Federal Water Pollution Control Act (FWPCA). For more than forty years the city has treated and recycled wastewater plant effluents. Despite its history of local water pollution control, pre-dating federal regulation, Phoenix has been lumped with other cities for which the Environmental Protection Agency (EPA) prescribes rules to abate pollution. The major problems with FWPCA rules and regulations center around two areas: the construction grant program and the National Pollution Discharge Elimination System (NPDES). More specifically, criticism is aimed at forcing industries with their own pre-treatment facilities to be subjected to industrial cost recovery. Further criticism questions the validity of fecal coliform as an index to determine secondary treatment efficiency. Instead of painting every locality with the same broad brush, the regulations augmenting the FWPCA should be reasonably interpreted in a flexible manner to avoid arbitrary, and somewhat irrational, regulation. Local circumstances should be considered with success being measured by the elimination of pollution and not merely by compliance with the rules. (Rieck-Florida)

Identifiers: Benefit maximization, Western United States.

The optimal allocation of water to sequential irrigators is considered with emphasis on downstream salinity damages caused by salt-concentrating mechanisms inherent in irrigated agriculture. Outlined is a physical hydrosalinity model that characterizes multi-irrigation district rivers and is used to develop a dynamic programming framework for the efficient allocation of water among districts. The focus is upon returns (maximization of net benefits) to farmers as a function of quantity and quality of water diverted and upon developing an operational model on which a viable water rights pricing scheme could be based. The allocation is achieved using the dynamic programming framework with decision variables of amount diverted, land irrigated, and amount of irrigation canals lined. This framework is used to investigate a scheme whereby water is purchased and held for downstream use solely as a dilutant. The basis is established in principle for an operational water rights market where all purchasers are financed by downstream beneficiaries. this framework would facilitate discovery of reallocations that are Pareto superior to existing allocations and computation of the individual purchase offer that must be made to each district to compenstate it for acreage withdrawn from irrigation under these new allocations in order to reduce salintiy impact on the downstream users. Four example solutions are presented. Probably, better resolution of salinity management problems will evolve if trade-offs and 'efficiency forntiers' are correctly perceived. (Bell-Cornell)

METHOD OF DISPERSING OIL IN WATER,
Imperial Chemical Industries Ltd., London (England). (Assignee).
P. G. Osborn, P. F. Nicks, and M. G. Norton.
U.S. Patent No. 3,996,134, 7 p, 6 ref; Official Gazette of the United States Patent Office, Vol 953, no 1, p 282, December 7, 1976.

Descriptors: *Patents, *Oil spills, Oil Pollution, *Water pollution sources, *Water pollution control, Dispersion, Chemical compounds, Resins.
Identifiers: *Oil slicks.

One method of disposing of an oil slick is to disperse the oil in water as fine and stable droplets which are then less of a hazard to bird and marine life and which are more readily broken down by microbiological action. For dispersion to be effective, however, it is necessary to use a very efficient dispersing agent which has long lasting action so that the oil droplets do not readily re-agglomerate to a slick. This invention provides a method of dispersing oil slicks which is efficient and in which the dispersed oil droplets do not readily coalesce. The method is not limited to this one use but can be used in secondary oil recovery and tar-sand oil recovery. It comprises contacting the oil and water with an alkyd resin in which one component of the resin is the residue of a water-soluble polyalkylene glycol such as a polyethylene glycol. (Sinha-OEIS)

PUMP-FILTER FOR BILGE WATER,
P. Jakubek, and K. Biswanger.
U.S. Patent No. 3,996,136, 13 p, 12 fig, 2 tab, 14 ref; Official Gazette of the United States Patent Office, Vol 953, no 1, p 283, December 7, 1976.

Descriptors: *Patents, Water pollution, *Water pollution treatment, Oil pollution, *Oily water, Water quality control, Separation techniques, Filtration, Equipment.
Identifiers: *Bilge water treatment.

The polluted liquid is fed into a separation chamber in the bottom of a two-part housing where it undergoes a preseparation so that the liquid pollutant rises to the top of the liquid in this separation chamber. A pump has its intake connected to this separation chamber at a lower region and has its output connected to an upper compartment of a compensation chamber above the separation chamber and subdivided into this upper compartment and a lower compartment by a filter. The liquid passes vertically down through this filter in the compensation chamber and is then withdrawn in a highly pure state from the lower compartment. The pump is only operated when the liquid level in the separation chamber is above a predetermined minimum level.

G. H. Pfeiffer.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-268 113, Price codes: A13 in paper copy, A01 in microfiche. PhD Thesis, 1976. 273 p, 18 fig, 60 tab, 105 ref, 3 append. OWRT B-059(WASH)(1). 14-31-0001-5125.

Descriptors: Irrigation, *Return flow, Water quality control, *Irrigation efficiency, *Economic impact, River basins, Pollutant abatement, *Washington, Environmental control, *Water temperature, Sediment transport, Costs, Nitrates, Nitrogen.
Identifiers: *Yakima River basin(Wash), *Sediment loss, *Nitrate nitrogen, *Non-point pollution sources.

The nature of non-point discharges of effluents into the environment makes direct control of environmental quality impossible. Economic theory suggests, however, that efficient pollution abatement is possible by controlling the use of those inputs functionally related to environmental degradation rather than controlling the effluents themselves. Water quality degradation caused by irrigation return flows is an example of the effects of non-point discharges which can only be controlled by restrictions on input use. The objective of this study was to examine the economic impacts of policies affecting agriculture which would improve water quality in the Yakima River. The Yakima River Basin is an intensively cultivated river basin in which the major user of river water is irrigated agriculture. Three environmental quality parameters were identified for evaluation: nitrate nitrogen concentration in the river, water temperature in the river, and annual sediment lost for farms in the Basin. The results show that substantial improvements in environmental quality in the Yakima River are possible, but only at significant social and producer costs. These costs must be compared with the benefits of improved environmental quality in order to determine appropriate abatement policies and water quality standards.

METHODOLOGY AND DATA FOR ANALYZING QUANTITY, QUALITY AND ECONOMIC ASPECTS OF MINIMUM STREAMFLOWS, APPENDICES, VOLUME 2,
Washington Univ., Seattle. Dept. of Economics.
J. A. Crutchfield, B. W. Mar, J. W. Crosby, III, and J. F. Orsborn.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-268 065, Price codes: A14 in paper copy, A01 in microfiche. Washington Water Research Center, Pullman, Dec 1975. 303 p. OWRT B-037-WASH(2). 14-31-0001-3349.

Descriptors: *Methodology, *Water quality, *Water supply, *Economics, Flow, *Low flow, Minimum flow, Water allocation(Policy), Competing uses, *Legal aspects, Preferences(Water rights), *Washington, *Water conservation, Recreation, Aesthetics.
Identifiers: *Instream flow.

The study was undertaken to develop methodologies for establishing the legally prescribed minimum flows and levels in streams and lakes in the State of Washington. As more states attempt to preserve their natural resources through the enactment of legislation, their efforts provide a valuable experience record. But, in establishing 'minimum' or 'base' flows in streams for the protection of natural values, the development of methodology to apply the laws has not been accomplished and is of particular concern to both state and federal agencies. The overal objective of this study has been to develop methods for analysis of the quantity, quality and economic factors associated with the establishment of low-flow criteria for conservation, recreation and aesthetic purposes. Volume 1 of this report (see W74-07847) was prepared to describe various aspects of the problems associated with the establishment under law of minimum streamflows for preservation of instream values. Volume 2 provides more detailed information and data on those aspects.

THE IMPORT - EXPORT CLAUSE AND CONTROL OF OIL POLLUTION: REGULATORY FEE IMPOSED PURSUANT TO THE POLICE POWER,
P. J. Lipscomb.
Boston University Law Review, Vol 54, No 3, p 610-36, May 1974.

Descriptors: *Maine, Oil pollution, *Oil spills, *Consitutional law, Shore protection, Coasts, Harbors, Water pollution sources, Legislation, Legal aspects, Environmental control, Federal government, Public health, State jurisdiction, Ships.
Identifiers: *Hazardous substances(Pollution), Supertankers, Marine environment, Absolute liability.

The Maine Legislature enacted the Oil Discharge Prevention and Pollution Control Act of 1970 in recognition of the fact that, as the only East Coast state capable of accommodating the increased traffic of oil supertankers, the risks of oil spills on Maine's shores are likely to increase. Under the Act, the state's oil terminals are required to purchase a license, the cost of which is directly related to the number of barrels of oil transferred over water. The fund thus created covers the cost of oil spill clean-up operations and damage awards to private parties, with the state recouping these costs from the terminals involved based on an absolute liability provision. The validity of the statute was challenged by terminal operators, and the question of whether the Maine high court properly held the fee to conform to the Import - Export Clause of the Constitution is the subject of this case comment. The author, however, postulates while it is a direct levy, it should be considered valid, because it is not a revenue measure, but is enacted pursuant to the state's police power to protect the public welfare. (Jones - Florida)

TIMBER PRODUCTS PROCESSING POINT SOURCE CATEGORY EFFLUENT GUIDELINES AND STANDARDS,
Environmental Protection Agency, Washington, D. C.
Federal Register, Vol. 41, No. 238, p. 53930-38, December 9, 1976.

Descriptors: *Federal Water Pollution Control Act(FWPCA), *Lumbering, *Waste water treatment, *Water quality standards, *Regulation, Standards, Administrative agencies, Federal government, Chemicals, Industrial wastes, Toxicity, Effluents, Costs, Economic impact, Water quality control, Pollutants, Public health, Pollution, Pulp and paper industry, Wood wastes.
Identifiers: *Administrative regulations, *Timber products processing.

The Environmental Protection Agency (EPA) has promulgated in interim final form effluent limitations and guidelines for existing sources and standards of performance for new sources for the timber products processing point source categories. The EPA has received and commented upon statements from the public-at-large concerning the proposed regulations. The Commissioner expects no adverse economic effect for any member of the timber processing subcategory other than the wood preserving subcategories as a result of the regulations. Specific pollutants curtailed by the regulations include phenolic, COD and oil. Practices and procedures suggested to reduce the quantity of effluents include the elimination of equipment and piping leaks, the minimization of spills by the use of good housekeeping techniques, recovery and reuse of contaminated water, and segregation of contaminated and uncontaminated water streams. The estimated expense for control of waste water pollutants is a $138,500 capital cost and a $52,480 annual cost. (Moorhouse-Florida)
W77-08356

NONFERROUS METALS MANUFACTURING POINT SOURCE CATEGORY PRETREATMENT STANDARDS.
Environmental Protection Agency, Washington, D.C.
Federal Register, Vol 41, No 242, p 54850-54, December 15, 1976.

Descriptors: *Federal Water Pollution Control Act(FWPCA), *Metals, *Aluminum, *Copper, *Waste water treatment, *Water quality standards, Regulation, Standards, Administrative agencies, Federal government, Cadmium, Zinc, Chemicals, Water quality control, Pollutants, Economic impact, Pollutions, Costs, Effluents, Toxicity, Industrial wastes.
Identifiers: *Administrative regulations, *Nonferrous metals manufacturing.

The Environmental Protection Agency (EPA) has established effluent limitations and guidelines in interim final form for the nonferrous metals manufacturing point source category. The public were afforded an opportunity to respond and the EPA has summarized their comment. The director anticipates that the economic effects of these regulations will be minor. Copper and aluminum compose the major industries in the nonferrous metals manufacturing category. Type of product, raw waste load, type of manufacturing process and treatability of waste water were all considered in determining the standards. Wastewater pollutants sought to be curtailed by these standards are pH, COD, zinc, copper, cadmium, chloride, ammonia, and oil and grease. Technology suggested in order to reduce toxic effluents included settling and grease traps as well as in-plant reuse and recycle waste water processes. (Moorhouse-Florida)
W77-08357

TOXIC POLLUTANT EFFLUENT STANDARDS FOR BENZIDINE.
Environmental Protection Agency, Washington, D.C.
Federal Register, Vol 42, No 8, p 2617-21, January 12, 1977.

Descriptors: *Federal Water Pollution Control Act(FWPCA), *Chemical industry, *Water quality standards, Regulation, Standards, Chemicals, Industrial wastes, Effluents, Costs, Monitoring, Water quality control, Public health, Federal government, Legislation, Pollutants, Water pollution control, Environmental effects, Administrative agencies, Cost-benefit analysis, Textiles, Water pollution sources, Navigable waters.
Identifiers: *Carcinogens, *Benzidine, Administrative regulations.

Pursuant to section 307(a)(2) of the Federal Water Pollution Control Act (FWPCA) of 1972, the Environmental Protection Agency (EPA) proposed toxic pollutant effluent standards for the chemical benzidine. The regulations establish effluent standards for all manufacturers of benzidine and benzidine-based dyes and the principal users of benzidine-based dyes who discharge directly into navigable waters. Standards are proposed for both existing and new sources. The principal applicator categories, and those which are covered in the EPA's standards, are manufacturers of paper goods, leather goods and textile goods who use benzidine-based dyes in their processes. Despite objections over the cost of monitoring from chemical manufacturers, the EPA believes the cost of mass balance monitoring is quite small. No evidence was introduced at the hearings to the contrary. Whatever minimal costs there may be would appear to be justified in order to insure that the industry continues to comply with the EPA's effluent standards for benzidine. This would assure the requisite protection of human health from exposure to this proven carcinogen is being provided. (Rieck-Florida)
W77-08359

EFFLUENT GUIDELINES AND STANDARDS FOR FERTILIZER MANUFACTURING POINT SOURCE CATEGORY, NITRIC ACID SUBCATEGORY.
Environmental Protection Agency, Washington, D.C.
Federal Register, Vol 41, No 11, p 2386-88, January 16, 1976.

Descriptors: *Fertilizers, *Nitrogen compounds, *Ammonium compounds, *Agricultural chemicals, Water pollution sources, Water pollution, Administrative agencies, Federal government, Effluents, Industrial wastes, Liquid wastes, Waste water(Pollution), Regulation, Ships, Gases, Nitrogen, Ammonia, Organic compounds.
Identifiers: *Administrative regulations, *Effluent limitations.

The Environmental Protection Agency (EPA) has amended 40 CFR 418 concerning the Fertilizer Manufacturing Point Source Category. Previous regulations for the nitric acid subcategory of the fertilizer manufacturing point source category required no discharge of process wastewater pollutants into navigable waters. As a result, twelve fertilizer manufacturers joined in a petition for judicial review of the nitrogen fertilizer regulations. The companies demonstrated a need for a leaks and spills amendment to the regulations. The EPA rejected such an approach and instead amended the regulations to allow limited discharges from the sources that were identified. Shipping losses are excluded from the new regulations. Good housekeeping, prompt and regular maintenance, and careful operations will tend to minimize the losses from shipping. (Moorhouse-Florida)
W77-08360

SOVEREIGNTY AND THE CONTROL OF WATER POLLUTION,
D. G. Lehv.
Environmental Affairs, Vol 2, No 2, p 421-43 (Fall 1972).

Descriptors: *Massachusetts, *Governmental interrelations, *Local governments, *State governments, Legal aspects, Governments, Administration, Legislation, Government finance, Regulation, Water law, Pollution, Costs, Taxes, Financing, Judicial decisions, Penalties(Legal), Waste water(Pollution).
Identifiers: Mandamus, Sovereignty, Police power, Fines.

Grafton, Massachusetts, by its refusal to appropriate funds for the construction of a municipal sewage treatment facility has clearly demonstrated the need for different methods of judicial and administrative enforcement of state directives. That waste treatment and other facets of pollution control are within the scope of the police power of the state is uncontested. The conflict arises when the exercise of that power contravenes municipal determinations. Massachusetts courts have long recognized the superiority of the state in such conflicts. The existing judicial remedies of civil contempt, criminal contempt, and criminal prosecution have proven ineffective. Imposition of fines is one alternative. However, Grafton ignored a $2000 fine. The issuance of a writ of mandamus is unlikely, since construction of municipal facilities is a discretionary duty. Another alternative would be to treat the municipality as a judgment-debtor of the state. Thus mandamus could compel the levying of taxes for payment of the debt, or city funds could be sequestered. Cities may be immune to these methods, however. Perhaps the only viable remedy is legislative enactment of a general law providing for the creation of autonomous sewer authorities whenever municipalities refuse compliance with state orders to abate pollution. PROPOSED EFFLUENT GUIDELINES AND STANDARDS FOR IRON AND STEEL MANUFATURING,
Environmental Protection Agency, Washington, D.C.
Federal Register, Vol 41, No 61, p 13015-30, March 29, 1976.

Descriptors: *Effluents, *Steel, *Iron alloys, *Structural steel, *Iron, Metals, Iron compounds, Administrative agencies, Regulation, Federal government, Wastes, Water pollution sources, Industrial wastes, Liquid wastes, Waste water(Pollution), Waste water disposal, Heavy metals, Metallurgy.
Identifiers: *Administrative regulations, *Effluent limitations.

The Environmental Protection Agency (EPA) has proposed effluent limitations for existing sources, standards of performance and pretreatment standards for new sources and pretreatment standards for existing sources concerning the iron and steel manufacturing point source category. Specific operations affected hereby are the hot forming-primary subcategory, the hot forming-section subcategory, the hot forming-flat subcategory, the pipe and tube subcategory, the pickling-sulfuric-acid-batch and continuous subcategory, the pickling-hydro-chloric-acid-bath and continuous subcategory, the scale removal-kolene and hydride subcategory, the wire pickling and coating subcategory, the continuous aldaline cleaning subcategory. The proposed regulations are in accordance with the goal of the best practicable control technology available by July, 1977. (Moorhouse-Florida)
W77-08370

EFFLUENT GUIDELINES AND STANDARDS FOR CANNED AND PRESERVED FRUITS AND VEGETABLES POINT SOURCE CATEGORY,
Environmental Protection Agency, Washington, D.C.
Federal Register, Vol 41, No 75, p 16272-86 April 16, 1976.

Descriptors: *Federal Water Pollution Control Act, *Canneries, *Water quality standards, *Regulation, *Waste water treatment, Standards, Administrative agencies, Federal government, Water pollution sources, Water pollution control, Effluents, Industrial wastes, Water quality control, Industrial plants, Industrial production, Industrial water, Economic impact, Biochemical oxygen demand.
Identifiers: *Administrative regulations, *Effluent limitations, Effluent guidelines, Point sources(Pollution), Pretreatment standards(Effluent).

The Environmental Protection Agency has established final regulations setting guidelines and standards for effluent limitations for the canned and preserved fruits and vegetables point source category. Significant changes from the proposed regulations include a more accurate and representative characterization of raw waste loads, a revision of the industry subcategorization and an easing of discharge limitations due to new data regarding treating systems. Limitations are established controlling the quantities of BOD5, and TSS and the quality of pH which may be discharged by fruit processing plants, vegetable processing plants and specialty foods processing plants. Specialty products include baby food, potato chips, ethnic foods, jams and jellies, mayonnaise, soups, and tomato-starch-cheese canned specialties. The EPA has summarized the comments made on the regulations by members of the canned and preserved fruits and vegetables industries and has responded there to. (Moorhouse-Florida)

THE 1972 WATER POLLUTION CONTROL ACT: UNFORESEEN IMPLICATIONS FOR LAND USE PLANNING,
A. B. Federman.
The Urban Lawyer, Vol 8, No 1, p 140-55 (Winter 1976).

Descriptors: *Waste water treatment, *Land use, *Sewage treatment, *Federal Water Pollution Control Act, Grants, Interceptor sewers, Sewage, Sewerage, Land development, Land management, Financial feasibility, Costs, Government finance, Financing, Local governments, Federal government, Political aspects, Planning, Long-term planning, Projections, Project planning.
Identifiers: *Federal Water Pollution Control Act Amendments of 1972, Environmental impact statement.

Title II of the Federal Water Pollution Control Act Amendments of 1972 (FWPCA) provides for grants for sewage treatment systems. Upon approval by the Environmental Protection Agency (EPA), areas having a substantial water quality control problem can receive up to 75 per cent of the cost of a regional treatment project. Encouraging areawide plans has had adverse effects on local land use control. Requiring that plans anticipate needs over a twenty year period has led to unnecessarily large and extensive sewage systems. Although the EPA has been reluctant to consider these implications of the FWPCA, there are three alternatives by which the EPA could influence local land use planning: (1) withold all funds for interceptor construction; (2) change the 75 percent grant to a matching formula; or (3) limit reserve capacity in a system to a specific fraction of initial flow. While the first alternative would result in more realistic population projections it could lead to decreased regionalization. The second alternative provides no control over the configuration of interceptors. Full 75 percent financing of a limited capacity system with additional capacity locally financed would provide a workable solution. Furthermore, local participation in planning stages could be increased by requiring public hearings and environmental impact statements exploring the adverse impact of expanded sewage treatment systems. PUBLIC HEARING REGARDING 180-DAY NOTICE TO THE SANTA FE LAND IMPROVEMENT COMPANY OF VIOLATION OF STATE AND FEDERAL WATER QUALITY STANDARDS FOR THE INTERSTATE WATERS OF THE KANSAS AND MISSOURI RIVERS, HELD AT KANSAS CITY, KANSAS ON 13 JULY 1971.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-244 924, Price codes: A04 in paper copy, A01 in microfiche. Transcript of Proceedings (1971), 70 p.

Descriptors: *Rivers and Harbors Act, *Environmental effects, *Sewage disposal, *Sewage treatment, *Administrative decisions, Kansas, *Missouri River, Missouri, Administration, Administrative agencies, Ultimate disposal, Sewage, Sewers, Disposal, Environmental control, Public health, Waste treatment, Wastes, Waste water disposal, Waste disposal, Water quality control.
Identifiers: *Kansas River.

Discharge of untreated sewage into a navigable river is in violation of the Federal Water Pollution Control Act and the 1899 Rivers and Harbors Act. In June 1971 the Administrator of the Environmental Protection Agency (EPA) notified the Santa Fe Land Improvement Company of Amarillo, Texas, that its operations located on and discharging effluent into the Kansas River constituted violations of the established state and federal water quality standards. In an effort to solve the problem, an informal public hearing was held involving the EPA, representative of Kansas Department of Health, and Department of Boulevards, Parks and Streets, the City Attorney for Kansas City, Kansas, and, Santa Fe Land Improvement Company. The parties agreed that they would cooperate in arriving at a remedial schedule by which Santa Fe would connect its sewers to those of Kansas City. Hopefully this joint effort will solve the pollution problem and avoid costly litigation. If the matter is not satisfactorily resolved by voluntary action, an abatement action may be brought against Santa Fe pursuant to the Federal Water Pollution Control Act. (Josepher-Florida)

ENVIRONMENTAL LAW-APPLICATION OF THE REFUSE ACT OF 1899 TO CONTINUAL INDUSTRIAL DISCHARGES IS UPHELD WITHOUT FORMALIZED PERMIT PROCEDURES,
J. J. Burton, Jr.
Emory Law Journal, Vol 23, p 281-92 (1974). 78 ref.

Descriptors: *Judicial decisions, *Water pollution control, *Water permits, *Law enforcement, Industrial wastes, Navigable rivers, Pollution abatement, Legal aspects, Permits, Water law, Legislation, Navigation, Pennsylvania, Federal government, Industrial plants, Water pollution sources, Penalties(Legal), Legal review, Regulation.
Identifiers: *Navigation obstructions, *Refuse Act of 1899, Defenses, Reliance, Corps of Engineers, Water Quality Act of 1965, Federal Water Pollution Control Act Amendments of 1972, Monongahela River.

In United States v. Pennsylvania Industrial Chemical Corp. (PICCO) the United States Supreme Court held that the absence of a formal regulatory permit program does not preclude prosecution for violation of the Refuse Act of 1899. However, relevant evidence of defendant's reliance on a limited construction of the statute by the agency responsible for its administration must be admitted. The Refuse Act has been subject to various interpretations. In 1966 the Supreme Court expanded the scope of the Act to include prohibition of all pollutant discharges into navigable waters regardless of their effect on navigation. The Court subsequently held that more modern legislation did not supercede or limit the Refuse Act. However, the Corps of Engineers, charged with administration of the Act, failed to accept the broader duty to control all pollution of navigable waters and acted only on navigation-impeding discharges. Since the restrictive interpretation given the Act by the Corps was not clearly erroneous, reliance on the administrative construction of the statute presented a viable defense. In the instant case, PICCO asserted that they had relied on the Corps' interpretation of the statute. The government contended that judicial precedent and recent publicity provided notice of the correct construction. The Supreme Court found that exclusion of reliance evidence was error. The Court thus opened the door to judicial battles over this defense, and substantially undercut the recently acquired strength of the Refuse Act. (Moorhouse-Florida)

EFFLUENT LIMITATIONS AND GUIDELINES FOR EXISTING SOURCES AND STANDARDS OF PERFORMANCE AND PRETREATMENT STANDARDS FOR NEW SOURCES FOR THE BLEACHED KRAFT, GROUNDWOOD, SULFITE, SODA, DEINK AND NON-INTEGRATED PAPER MILLS SEGMENT OF THE PULP, PAPER, AND PAPERBOARD POINT SOURCE CATEGORY.
Environmental Protection Agency, Washington, D.C.
Federal Register, Vol 40, No 173, p 41300-25, September 5, 1975. 75 tab.

Descriptors: *Pulp and paper industry, *Pulp wastes, *Sulfite liquors, *Wood wastes, *Chemical wastes, *Federal Water Pollution Control Act, Administrative decisions, Administrative agencies, Regulation, Effluents, Industrial wastes, Water pollution sources, Water pollution treatment, Water pollution control.
Identifiers: *Federal Water Pollution Control Act(FWPCA) Amendments of 1972.

Pursuant to the authority of the Federal Water Pollution Control Act (FWPCA), the Environmental Protection Agency (EPA) hereby gives advance notice of intent to promulgate effluent limitation guidelines for existing sources and standards of performance and pretreatment for new sources in the bleached kraft, groundwood, sulfite, soda, deink and non-integrated paper mills segment of the pulp, paper and paperboard point source category. The proposed regulations divide the point source category into 11 distinct subcategories: dissolving kraft, market kraft, BCT kraft, fine kraft, papergrade sulfite, dissolving sulfite, GW-chemi-mechanical, GW-thermo-mechanical, GW-CMN papers, GW-fine papers, soda, deink, NI fine papers, NI tissue papers and NI tissue FWP. For each subcategory limitations are set representing the reduction attainable through use of best available technology and through use of best available technology economically achievable. Where applicable, guidelines for use of wet woodyard operations are separately stated. Each sub-category also contains pretreatment and performance standards for new sources. (Comer-Florida)
W77-08383

OIL SPILLS AND SPILLS OF HAZARDOUS SUBSTANCES.
Environmental Protection Agency, Washington, D.C. Office of Water Program Operations.
Oil and Special Materials Control Division, March 1975. 29 p, 32 ref, 57 photo.

Descriptors: *Oil pollution, *Regulation, *Oil spills, Hazards, Disasters, Water pollution sources, Oil, Oil industry, Oil wastes, Legal aspects, Environmental effects, Water law, Remote sensing, Penalties(Legal), Law enforcement, Planning, Oily water, Cleaning.
Identifiers: *Hazardous substances(Pollution), *Administrative regulations.

The primary objective of the Environmental Protection Agency's (EPA) oil and hazardous substance spill program is to protect water quality through the prevention of spills. Various measures have been taken by the EPA to prevent spills and minimize their impact on the environment. Recognizing that the causes of oil spills are many, the EPA has published oil pollution prevention regulations requiring a Spill Prevention and Countermeasure (SPCC) Plan. The plan is flexible and functions under EPA guidelines. It requires owners and operators to prepare oil spill prevention plans, which must be certified by a Professional Engineer. As a guide the EPA has published a list of hazardous polluting substances. Should spills still result, the EPA is prepared to impose civil penalties. The EPA is continuing its investigations into methods for cleaning up spills. Some methods discussed include: Procedures for cleaning up slow-moving water; water soluble hazardous substances; and oily sand. Spill surveillance devices such as modern remote sensing systems are being used to quickly detect oil spills. Several recent spectacular spills are identified and discussed. (Hadoulias-Florida)

A STUDY OF COOLING INITIALLY UNIFORM AND THERMALLY STRATIFIED LAYERS OF WATER,
Purdue Univ. Lafayette, Ind. School of Mechanical Engineering.
M. Behnia.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-268 123, Price codes: A07 in paper copy, A01 in microfiche. Master of Science Thesis, December 1975. 123 p, 39 fig, 46 ref, 2 append. OWRT A-029-IND(11).

Descriptors: *Water cooling, *Water temperature, *Convection, Thermal conductivityy, *Thermal radiation, *Thermal stratification, Thermal pollution, Model studies, Evaporation, Water pollution.
Identifiers: Mach-Zehnder Interferometer.

A laboratory study is described of the cooling of initially uniform and thermally stratified layers of water by convection, evaporation, and radiation. Temperature measurements were made with a Mach-Zehnder interferometer and the flow field was visualized by electro-chemical dye. A lake was simulated in a 40 x 25 x 10 cm cell. Thermal stratification was induced by tungsten lamps in parabolic reflectors which produced collimated incident radiation flux. For the uniform temperature cell, water descended by free convection to a depth of 10-25 cm. The cooling rate had a decisive influence on the frequency of the descending parcels of cooler water. Mixing motion occurred near the surface in the thermally stratified cell. The motion had an initial regular roll pattern, but as cooling continued, the roll pattern in the convective layer deteriorated into motion similar to that observed during cooling of an initially uniform temperature layer of water. A model was developed to predict the dynamics of the convective layer. The numerical solution to the model equation was found to agree better with the experimental data than alternatives based on the closed form analytical solution using a constant average surface heat flux.

Descriptors: Hydraulics, *Impoundments, *Stratified flow, *Withdrawal, *Destratification, *Water quality, *Model studies, *Heated water, Discharge(Water), Lakes, Reservoirs, Hypolimnion, Forecasting.
Identifiers: *Selective withdrawal, Bottom withdrawal.

A variety of methods have been proposed to improve the water quality of lakes and reservoirs. This work is directed toward the overall improvement of water quality in a reservoir through the removal of the poor quality, hypolimnetic water. In particular, theoretical and experimental investigations on selective withdrawal of a viscous, non-diffusive, linearly-stratified fluid from the bottom and intermidiate depths of a reservoir have been carried out. The governing differential equations which describe planar and axisymmetric withdrawal are derived. In the case of bottom withdrawal a momentum integral technique that retains inertial effects is employed. This is in contrast to the intermediate axisymmetric withdrawal case, where a non-inertial similarity approach is used. In each case, theoretical horizontal velocity profiles are obtained together with expressions for

the thickness of the layer of hypolimnetic water withdrawn. Expressions are also derived in each case to predict the quality of the water withdrawn. Laboratory experiments are described; the results obtained verify the theoretical predictions reasonably well. Procedures for predicting the withdrawal layer thickness and discharged water quality in an actual reservoir are discussed.

RECLAMATION AND USE OF DISTURBED LAND IN THE SOUTHWEST.
University of Arizona Press, Tucson, Thames, J.L., ed., 1977. 63 fig, 42 tab, 654 p. $8.50.

Descriptors: *Reclamation, *Environmental effects, *Irrigation systems, *Mine wastes, *Strip mine wastes, *Southwest US, Mining, Irrigation, Water resources, Land use, Sprinkler irrigation, Irrigation efficiency, Hydrology, Wastes, Water pollution sources, Strip mines.
Identifiers: Trickle irrigation, Drip irrigation.

This volume is the result of a symposium on reclamation and land use in the Southwest, held January 1975 at the University of Arizona, Tucson. Its purpose is to contribute to an understanding of the constraints, alternatives and techniques in the reclamation of lands disturbed by mining and to present the latest results of major research efforts. The 33 articles by several authors are concerned with various facets of reclamation, including the advantages and disadvantages of the sprinkler system and drip or trickle irrigation as an effective way to facilitate revegetation of problem areas. Also discussed is use of water by the mining industry and the effects on the environment. (Jamail-Arizona)

PREDICTION MODELS OF REAERATION RATE FOR MOUNTAIN CREEKS,
Utah State Univ. Dept. of Civil and Environmental Engineering.
K. D. Davis.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-268 581, Price codes: A08 in paper copy, A01 in microfiche. M. S. Thesis, 1975. 138 p, 5 fig, 5 tab, 2 append. OWRT B-095-UTAH(2). 14-31-0001-4132.

Descriptors: Dispersion, Dissolved oxygen, *Mathematical models, Mixing, *Reaeration, Turbulence, *Utah, Model studies, Water pollution sources, Path of pollutants.
Identifiers: *Summit Creek(Utah), Smithfield(Utah), Reoxygenation, *Mountain creeks.

Reaeration process studies were conducted on a mountain creek and a large laboratory flume. The method of evaluating the dispersion coefficient, mean velocity, and reaeration coefficient for both creek and flume consisted of finding these values for a deoxygenated portion of the flow containing a conservative tracer (dye). The deoxygenated slug is measured as it moves downstream and the three values are best fit in the analytical solution of the longitudinal dispersion equation which dynamically describes the flow of the dispersing slug in the stream. The best fit was acomplished by using the method of least squares in which the sum of squares of the differences between and dissolved oxygen and dye concentrations calculated from the dispersion equation and those obtained from the actual measurements is minimized. A reaeration coefficient prediction model of general form was developed. The model is composed of two dimensionless parameters which were determined from the dissolved-oxygen balance equation. The model parameters were evaluated specifically for the mountain creek and laboratory flume. A comparison of this model with existing models revealed that most existing models are incomplete in form. Inclusion of the dispersion coefficient in the reaeration coefficient model improved the prediction accuracy.

AERATORS CONTROL LIFT STATION ODOR AND CORROSION,
Mullins (W. H.), Inc., San Antonio, Tex.
W. H. Mullins.
Water and Sewage Works, Vol. 124, No. 3, p 75, March, 1977.

Descriptors: *Aeration, Wells, *Odor, *Corrosion control, Sewage treatment, Organic matter, Solid wastes, Hydrogen sulfide, Performance, Color, Dissolved oxygen, Biochemical oxygen demand, Trickling filters, Treatment facilities, Equipment, Effluents, Waste water treatment.
Identifiers: Lift stations, Wet wells.

A preaeration process for the control of odor and corrosion at lift stations was described. Aerators with self-priming centrifugal pumps mix atmospheric oxygen with raw sewage to reduce organic solids to macroscopic size, to free solids from embedded and clinging gas particles, and to float suspended grease. Approximately 1,100 gallons of raw sewage can be circulated per minute. Recirculation from the wet well back to the first upstream manhole eliminates the release of hydrogen sulfide from raw sewage into the wet well. Upstream recirculation carries a raw sewage DO that varies from 4 to 6 milligrams/liter. Raw sewage color is changed from black to a foamy light tan. In addition to controlling odor and corrosion, this system also caused only grease to float on the surface of the primary clarifier; its effluent was relatively clear. The primary clarifier consistently removed 90-95% of settleable solids and 65-70% of BOD. The high degree of grease removal benefits the trickling filter secondary system of the treatment plant. BOD reduction between raw sewage at the lift station and at the plant varied from 10 to 20% depending on the time of day samples were taken. (Collins-FIRL)

Identifiers: *Regional planning, Cost minimizaon, Screening model, Sensitivity analysis, Pipeline gas, Systems engineering.

In regions where energy facilities place major demands on the water resources, it is desirable to plan the development of these systems with an understanding of their interrelationships. Described is a mathematical model of these interlocking systems. The major model components are the supply and demand points for water, electrical power, and pipeline gas that is produced from coal. The model allocates water to the various demands and locates energy facilities by subregions. Linear programming is utilized to evalute the model which is designed for preliminary screening purposes. The objective function is to minimize the sum of the site-dependent supply costs of water and the transportation costs for water, coal, electricity, and gas. An application of the model in Illinois demonstrates the utility of sensitivity analysis and parameterization techniques for examining trends and tradeoffs for alternative regional plans. The example also demonstrates the interrelated nature of the water resources and energy systems and demonstrates the potential impact of a large new coal-conversion industry on water resources. INPUT-OUTPUT MODELING IN WATER RESOURCES SYSTEM PLANNING,
Colorado State Univ. Fort Collins. Dept. of Civil Engineering.
D. W. Hendricks, and R. W. DeHaan.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-268 064, Price codes: A06 in paper copy, A01 in microfiche. Environmental Engineering Technical Report No. 3, November 1975. 92 p, 29 fig, 13 tab, 32 ref, 3 append. OWRT B-115 COLO(1), 14-31-001-5060.

Descriptors: *Input-output analysis, *Model studies, Planning, *Economics, *Water supply, *Water demand, *Colorado, Imported water, Agricultural water, Municipal water, *Future planning(Projected).
Identifiers: *South Platte River basin(Colo), *Water resources systems.

Principles of input-output modeling of economic systems are adapted to the description of a water resource system. The major sectors of supply and demand are identified, such as 'native surface water flows,' 'imported water,' 'agriculture,' 'municipal.' These sectors were disaggregated further into specific water transferring entities, such as particular streams, geographical regions of the agricultural sector, specific cities, etc. This resulted in an 81 x 80 matrix, displayed on a magnetic board. From this the distribution of available supplies is seen on the rows from each supply source. How each demand entity satisfies its needs is seen as the sum of the entries for the respective column. From this an entire water resources system is displayed at once. This was done for the year 1970 for the South Platte basin. The model can aid in planning for future years by imposing the future total demands for each water demand entity (as the bottom row entries). From this, alternatives for satisfying these demands can be seen.

6B. Evaluation Process

CITIZEN PARTICIPATION IN COMPREHENSIVE WATER RESOURCES PLANNING,
Massachusetts Univ., Amherst. Inst. for Man and Environment.
M. O. Ertel, and S. G. Koch.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-267 665, Price codes: A06 in paper copy, A01 in microfiche. University of Massachusetts Water Resources Research Center, Publication No. 77, August 1976, 103 p, 1 fig, 5 tables, 48 ref, 3 append. OWRT-B-044 Mass (1). 14-31-0001-5082.

Descriptors: *Social Participation, Planning, *Comprehensive Planning, Project planning, Decision-making, River basin development, *River basin commission, *Attitudes, *Social impact, Social values.
Identifiers: *New England River Basins Commission, *Citizen participation, *Public participation.

The research focused on documentation of the impact of citizen participation upon the planning recommendations of three Level B Studies of the New England River Basins Commission and an evaluation of the participatory strategies utilized to secure that participation. The documentation and evaluation were obtained through a detailed examination of Study documents, personal observations and interviews, and survey research. The major conclusion is that a professionally directed and designed program of public participation does play a significant role in the development of comprehensive plans that are responsive to public needs and opinions. Such programs, and certain identified elements in particular, also have a demonstrable effect upon resultant public approval of the planning recommendations. The importance of financial commitment to the direction of public participation programs, both through provision of a staff with responsibility and skills for such direction and of other supporting resources, is further illustrated by a selective review of the public participation programs of all six River Basin Commissions. INVENTORY OF COLORADO'S FRONT RANGE MOUNTAIN RESERVOIRS,
Colorado State Univ., Fort Collins. Dept. of Recreation Resources.
R. Aukerman, W. T. Springer, and J. F. Judge.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-267 669, Price codes: A08 in paper copy, A01 in microfiche. Colorado State University, Environmental Resources Center, Information Series No 23, May 1977. 159 p, 17 fig, 1 tab, 5 ref. OWRT B-132-COLO(2). 14-34-0001-6062.

Descriptors: *Colorado, *Reservoirs, *Recreation, Surveys, Decision making, Planning, Management, *Water demand, *Water utilizzation, Land use, Data collections, Water resources development.
Identifiers: *Front Range Mountain Reservoirs(Colo).

This inventory is an in-depth look at the characteristics of one of Colorado's most valuable resources–its front range high mountain water reservoirs. These reservoirs are storage and control points within a complex delivery system of water for agricultural, industrial, and municipal users. However, in more recent years, other water users have placed increasing demands on the water. As recreation, fish and game, pollution control and others have become recognized as highly important uses of the water, decisions on water allocation have become increasingly more complex. Limited water supply in combination with increasing water demands dictate that intelligent decisions be made on efficienct multiple use of scarce water resources. Colorado is presently entrenched in this difficult decision process. It is essential that those who must make and implement these decisions have accurate, readily available information on the water resource which is being considered. Therefore, this inventory has been undertaken to provide a single core of accurate and current reservoir data for decision making, planning and management. It is expected that all levels of government (federal, state and local) with water and land use planning and management responsibilities will find these data helpful.

COMPUTERIZED PLANNING SYSTEM FOR NUCLEAR POWER PLANT EVALUATION,
Krannert Graduate School of Management, Lafayette, Ind.
R. H. Bonczek, C. W. Holsapple, and A. B. Whinston.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-267 663, Price codes: A02 in paper copy, A01 in microfiche. (1976). 23 p, 5 fig, 9 ref. OWRT C-7005(6202)(1).

Descriptors: *Decision making, *Data storage and retrieval, *Social aspect, *Adoption of practices, Attitudes, *Indiana, Evaluation, *Planning, Environment, Networks, *Nuclear powerplants.
Identifiers: *Data management systems, *Generalized planning system, Socio-technological issue.

A computerized system is described for information storage and query processing adapted to complex socio-technological issues. The system is referred to as GPLAN (Generalized Planning System) and can accommodate both qualitative (verbal) and quantitative data. The issue illustrated is the construction of a nuclear power plant, and involves interdisciplinary research and planning. The system's outstanding features are the utilization of the network variety of data base, the selective retrieval of any configuration of data from a particular network structure, automatic execution of any desired application program from a standard or special library of applications, user interface with a data base and applications by submitting English-like, non-procedural queries, and generality which allows tailoring to specific applications and provides a basis for integration of planning and research activities. The system is general and can be used for a wide variety of socio-technological issues which involve complex data relationships. (Wiersma-Purdue)

DISCRIMINANT ANALYSIS OF CHARACTERISTICS DETERMINING ACCEPTANCE OR REJECTION OF NUCLEAR POWER,
Krannert Graduate School of Management, LaFayette, Ind.
C. Holsapple, and A. Whinston.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-267 664, Price codes: A02 in paper copy, A01 in microfiche. (1976). 13 p, 1 fig, 1 tab, 3 ref. OWRT C-7005(6202)(2).

Descriptors: *Nuclear powerplants, *Social aspects, *Attitudes, Nuclear energy, Decision making, *Indiana, Environment, Model studies.
Identifiers: Linear discriminant models, *Discriminant analysis.

This study utilizes the linear discriminant model to analyze demographic and attitudinal data concerning the construction of a nuclear power facility at the Bailly site in northern Indiana. The objective is to ascertain the extent to which various respondent characteristics are useful in distinguishing among respondent attitudes (opposed, in favor, unsure) toward the Bailly project. Examination of reduced space characteristics leads to an interpretation of its two dimensions as respondent uncertainty and respondent resistance. The largest

contributor (positive) to uncertainty was a divorced or separated marital status; the greatest contributor (negative) to resistance was home ownership. Both of these respondent characteristics were significant in the univariate sense. A particularly striking trend was the reliance of the opposed group upon electronic media as the source of most local news, whereas the other two groups tended to rely most heavily on newspapers.

Available from the National Technical Information Service, Springfield, VA 22161 as PB-268 007, Price codes: A10 in paper copy, A01 in microfiche. M.S. Thesis, 1975. 196 p, 42 refs. OWRT A-055-WIS(2), 14-31-0001-4050.

Descriptors: *Evaluation, *Testing procedures, *Resources, *Decision making, *Regional development, *Social participation, *Wisconsin, Planning.
Identifiers: Dunn(Wisc), Dane County(Wisc), *Public participation.

An analysis of resource problem definition and solution is provided in terms of concepts about how the public participates in expressing and defining environmental and resource problems and influencing the actions taken. These concepts are traced from their philosophical and theoretical bases, through considerations of the planning process, and finally to discussions of several contemporary participation techniques and communication methods. A proposed planning research methodology is described, using the previous discussions as a guide for its rationale and use. In what manner information can be organized and presented, as well as the type of information that is generated by a specific technique, namely, Target Technique, are also demonstrated.

Available from the National Technical Information Service, Springfield, VA 22161 as PB-267 913, Price codes: A04 in paper copy, A01 in microfiche. Oklahoma Water Resources Research Institute, Stillwater, (1976). 65 p, 6 ref, append. OWRT B-026-OKLA(2), 14-31-0001-3928.

Descriptors: *Recreation demand, Recreation, *Computer programs, *Planning, *Demand, Evaluation, Simulation analysis, Attitudes.

A computer program (RECSAD: RECreation Supply And Demand) has been described which is believed to have some utility for planners. The program is designed to afford users flexibility with respect to availability of data, preferred assumptions about recreationist behavior, and locally relevant planning strategies. Program outputs include measures of available opportunities, peak demand, latent demand, fulfilled demand, usage of facilities with respect to capacity, and others. Outputs may be utilized directly, or they may be used as inputs to descriptive or analytical statistical packages in order to evaluate the recreation system more fully. Successive runs of the program can be used to simulate conditions under postulated changes in temporal or spatial demand conditions or under planned changes to the recreation system.

URBAN DRAINAGE AND FLOOD CONTROL PROJECTS: ECONOMIC, LEGAL, AND FINANCIAL ASPECTS,
Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
N. S. Grigg, L. H. Botham, L. Rice, W. J. Shoemaker, and L. S. Tucker.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-268 042, Price codes: A05 in paper copy, A01 in microfiche. Hydrology Paper 85, February, 1976. 78 p, 5 append. OWRT B-113-COLO(9), 14-31-0001-5059.

Descriptors: *Cost-benefit analysis, *Flood control, *Evaluation, Benefits, Budgeting, Cities, Drainage, Drainage practices, *Drainage programs, *Economic justification, Feasibility, Financial feasibility, Flood plains, *Project benefits, Runoff, *Storm drains, Financing, *Urban drainage.
Identifiers: Drainage law.

Techniques for evaluating minor and major Urban Drainage and Flood Control (UDFC) Projects are described. Economic, political, engineering, financial and legal problems must be faced prior to implementation of proper levels of these projects. The measurement of tangible benefits is described while a literature review revealed no direct objective techniques for quantifying intangibles. Some methods for establishing the relative rankings of intangible contributions show promise for improvement of evaluation techniques, however. The legal problem of establishing benefits is described and a copy of recently enacted Colorado legislation is included. Information on the estimation of flood damages and the selection of discount rates is presented. Careful coordination of land use and drainage control measures is stressed. Related recent legislation and regulations are included.

Descriptors: *Multiple purpose projects, *Water resources development, *Social aspects, *Small watersheds, Project planning, Social impact, Decision making, Estimated costs, Estimated benefits, Water management(Applied).
Identifiers: *Net national benefits, *Trade-offs, *Environmental quality.

This study was an exploration into multiple social goal decision making with reference to small watershed resource planning. The empirical model developed is based on the West Boggs Creek Watershed in Martin and Daviess Counties in Indiana. The programming model consists of maximizing a linear objective function for net national benefits, subject to constraints for physical and institutional limits, discrete activities and incompatible activities. Environmental quality standards were not determined a priori to the evaluation, rather, each of the constraints was ranged to develop the trade-off between the social objectives. Trade-offs between net national benefit and eight environmental components were identified and functional relations developed from the observations of trade-offs ratios. It was found that the environment of the watershed improved considerably befire there was any constraint imposed on national benefits. As soon as the national benefit becomes constrained by environment, all the relationships between the valued and nonvalued objectives are competitive in nature, indicating that there is a definite cost to increasing environmental quality. The model provided information on the causes of the objective trade-offs by reference to the activity taking place as the environmental constraints were parameterized. The results indicated the activities and order of installation which would be most beneficial to improving environmental quality. (Wiersma-Purdue)

PLANNING CHALLENGES IN THE MANAGEMENT OF COASTAL ZONE WATER RESOURCES,
Victoria Univ. (British Columbia). Dept. of Geography.
D. Sewell.
In: Proceedings of the International Conference on Water Law and Administration, International Association for Water Law, February 8-14, 1976, Caracas, Venezuela; Published by the Commission for the National Water Resources Development Plan (COPLANARH), Caracas, Venezuela, Vol. 14, 1976. 24 p, 62 ref.

Descriptors: *Coasts, *Planning, *Institutions, *Administrative agencies, Comprehensive planning, Project planning, Governments, Oceans, Fisheries, Water management, Water utilization, Legal aspects, Regulation, Water law, Institutions, Environmental effects, Political aspects, Social aspects, Jurisdiction, Research and development, Environmental control, Cost-benefit analysis.
Identifiers: *Coastal zone water resources, *Coastal zone management, Coastal Zone Commission.

This paper identifies the problems of water management in the coastal zones, and then suggests institutions and methods of planning needed for effective resolution of these problems. The problems include a need for devising methods to equalize the negative and positive effects of externalities, and mechanisms whereby common pro-

perty resources are shared equitably. In the past problems arose from conflicts in goals and duplication of efforts due to the division of planning functions among different government levels. Other problems involved a concentration upon a narrow range of alternatives and evaluation of criteria, and failure to account for the impact of policies and programs on other agencies. The author suggests formation of a Coastal Zone Commission to undertake planning on a comprehensive region-wide basis, or a river basin planning authority. Techniques of analysis such as systems modeling, benefit cost analysis, and environmental impact analysis should be used. Attention should be given to the peculiar problems of each coastal zone, including division of responsibilities, and the relationships of the water, land, ocean and atmospheric resources. (Hadoulias-Florida)

TICKET TO THERMIDOR: A COMMENTARY ON THE PROPOSED CALIFORNIA COASTAL PLAN,
University of Southern California, Los Angeles. School of Law.
R. C. Ellickson.
Southern California Law Review, Vol. 49, No. 4, p. 715-36 (May 1976).

Descriptors: *Administrative agencies, *California, *Comprehensive planning, *Economic efficiency, *Governmental interrelations, Political aspects, Conservation, Regional development, Non-structural alternatives, Local governments, Regulation, State governments, Planning, Multi-purpose projects, Legislation, Decision making, Administration, Administrative decisions.
Identifiers: *Coastal zone management, Coastal waters.

The California Coastal Zone Conservation Commission, established in 1972 by the voters, was required to produce a coastal plan by December 1, 1975. Rather than making specific land use designations, the Commission proposed several hundred policies and subpolicies of general application, and recommended an administrative structure for carrying them out. The basic theme of this commentary is that the California Legislature should reject the plan. The program to preserve agricultural lands shows that the plan lacks notice of market resource-allocation; the ends sought do not justify massive intervention in private land markets. Solar energy is not necessarily the best solution for energy production. Reliance on urbanization rather than scattering of development may be negated by lack of urban consumer demand for housing. The plan does not specify whether zoning in coastal areas will be a state or local function. The plan's inefficiencies will benefit planners, attorneys and the economic elite, while taxpapers and housing consumers will lose. Perhaps a massive state coastal agency acting as an information clearinghouse would improve efficiency. (Molloy-Florida)

DETERMINATION OF WATER-RESOURCES POLICIES IN ARID LANDS,
C. Clay.
In: Social Science Research in Dry Lands, Templer, O.W., ed. Frontiers of the Semi-Arid World: An International Symposium, October 14-18, 1974, Lubbock, Texas. International Center for Arid and Semiarid Land Studies (ICASALS) 1976 Publication no 76-6, p 15-24, 12 ref.

Descriptors: *Water policy, *Water resources, *Arid lands, *Environmental effects, *Water resources development, *Inter-basin transfer, Water pollution sources, Governments, Comprehensive planning, Planning, Water reuse, Water transfer.

The problem of water resources planning as part of overall policy making is discussed, and the highlights of studies concerning water resources policy in arid lands and recommendations of the National Water Commission are presented. The problem of pollution and environmental damage in both developed and underdeveloped nations is discussed. The possibilities of and problems associated with interbasin transfer of water are evaluated, and water transfer from Canada to the U.S. and possibly even Mexico is presented as an example. The possible alternative sources of water for arid lands, including cloud seeding and desalination, are discussed; recycling of water and reduced use by irrigation are mentioned as other methods of conserving water. In summary, arid lands need to develop comprehensive water plans, and the political, economic, and environmental aspects of interbasin transfer must be studied carefully. (Jamail-Arizona)

AGRICULTURAL WATER DEMAND IN WAKE COUNTY, NORTH CAROLINA,
North Carolina State Univ., Raleigh. Dept. of Biological and Agricultural Engineering.
P. R. McLoud.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-267 934, Price codes: A06 in paper copy, A01 in microfiche. M.S. Thesis, 1975. 99 p., 44 tab, 37 ref, append. OWRT B-068-NC(3), 14-31-0001-4114.

Descriptors: *Agricultural water, *Water demand, *Water utilization, *Irrigation water, *Water requirements, Irrigation, Computer models, Linear programming, *North Carolina, Computer programs, Forecasting, Future planning(Projected).
Identifiers: *Agricultural water demand, Irrigation policy, *Wake County(NC).

The objective was to develop data concerning crops, soils, climate, irrigation practices, and costs of agriculture in Wake County, North Carolina. These data were used in two computer programs: the first to compute water usage at a specified level of agriculture, and the second to compute by linear programming the optimum level of agriculture. Using the results of these computer programs, estimates of current irrigation water usage and predictions of usage by the year 2000 were made. The estimates and predictions were made for low, average, and high yearly rainfall levels of 33.5, 45.0, and 58.0 inches respectively. (Stewart-North Carolina State)

FEDERAL STATUTORY MODIFICATION OF PRIVATE WATER RIGHTS IN SOUTH FLORIDA,
Florida Univ., Gainesville. School of Law.
W. A. Bollinger.
Available from Eastern Water Law Center, University of Florida, College of Law, Gainesville, Florida 32611, $2.35. November 1971, 26 p.

Descriptors: *Florida, *Water rights, *Federal jurisdiction, *Competing uses, *Federal-state water rights conflicts, Jurisdiction, Regulation, State jurisdiction, Water contracts, Water transfer, Water utilization, Relative rights, Legal aspects, Water law, Water resources, Compensation, National parks.

In June 1970 Congress amended the Flood Control Act of 1948 in a move destined to have a nationwide impact on water allocation. The legislation authorizes $25 million for the Central and Southern Florida Flood Control District so long as $5 million is used for water flow needs to the Everglades National Park. The Park receives 16.5 per cent of the district's annual deliveries. This imposes a guaranteed annual minimum water flow to the Park. The history of the South Florida area is important to an understanding of the amendment, therefore the author traces the history and makeup of the geographical region. The legal problems of the amendment are serious, especially the implications of federal control of water rights. Guaranteeing the Park a federal water appropriation that differs from that of other non-federal users raises the 'states rights' issue. While federal authority in water resources development is constitutionally well founded, the courts may favor an award of compensation to those whose water rights have been affected by federal action. However, South Florida's increasing urbanization and industrialization will put a heavy burden on the region's water resources, and the state alone does not have the funds to sustain the dwindling resources. Thus, Florida will have to accept the federal regulation, as well as take its own positive steps toward developing strict controls. (Welch-Florida)

WATER RESOURCE POLICIES AND AUTHORITIES, COASTAL ZONE MANAGEMENT PROGRAM IMPLEMENTATION,
Corps of Engineers, Washington, D.C.
Federal Register, Vol 41, No 137, p 29146-49, July 15, 1976.

Descriptors: *Coordination, *Governmental interrelations, *Water management(Applied), *State governments, *Coasts, Coastal plains, Administration, Administrative agencies, Legal aspects, Water law, Planning, Projects, Water zoning, Administrative costs, Coastal marshes, Management, Project planning, Technology.
Identifiers: *Coastal zone management, *Administrative regulations, Coastal Zone Management Act of 1972.

The Department of Defense through the Corps of Engineers has proposed new rules pertaining to the Coastal Zone Management Program. The new regulations provide guidance and procedures for the Corps in assisting state programs in accordance with the 1972 Coastal Zone Management Act. State programs must include both short and long range objectives and focus on seven designates substantive elements. Each coastal state has primary responsibility for its own program. Federal administration of the program is to be handled by the National Oceanic and Atmospheric Administration. The Corps of Engineers will fully cooperate with the states and provide technical assistance upon request. Furthermore, all Corps projects shall be in conformance with state programs to the maximuum extent practicable. Corps offices preparing data critical to state planning and management shall assist the states in every way possible and lead offices shall be designated with responsibility for coordination of all Corps Civil Works activities within a particular state coastal zone. In addition, the proposed rules provide for funding of all Corps participation by the federal government subject to certain restrictions. (Moorhouse-Florida)

LEADVILLE MINE DRAINAGE TUNNEL ACT OF 1976.
Hearings---Sub Comm on Energy and Water Resources--Comm on Interior and Insular Affairs, U. S. Senate, June 7, 1976, p 1-24.

Descriptors: *Federal Water Pollution Control Act, *Mining, *Mine drainage, *Tunnels, *Colorado, Legislation, Water pollution, Mineral industry, Shafts(Excavations), Underground structures, Excavation, Administrative agencies, Groundwater, Water management(Applied), Confined water, Mine water, Waste water(Pollution), Impoundments, Impounded waters, Sinks.

In June 1976, the Senate Committee on Interior and Insular Affairs conducted a hearing to consider a bill authorizing investigation, stabilization, and rehabilitation of the Leadville Mine Drainage Tunnel. The tunnel had been constructed during World War Two and the Korean War to facilitate drainage of water out of a mining district in which there were large quantities of strategic metals (lead, copper and zinc). From the completion of the tunnel in 1952 until 1976 there had been no maintenance of the tunnel, and the consequent deterioration of its interior has resulted in an impoundment of water estimated to be more than 8,000,000 gallons. This impoundment in turn has created a hazard to the community in the form of sink holes throughout the surrounding area. The proposed bill would authorize rehabilitation of the tunnel and construction and maintenance of facilities to treat the water to be drained in accordance with the Federal Water Pollution Control Act (FWPCA). Statements presented at the hearing include those of an official of the Colorado Department of Natural Resources; Chief Mining Engineer of the Bureau of Mines; and Assistant Commissioner of the Bureau of Reclamation. STATES NEED FREEDOM TO INNOVATE (COMMENT ON PL 92-500).
Kansas Dept. of Health and Environment, Topeka.
Water and Sewage Works, Vol 122, No 1, p cover, 4 (Jan 1975).

Descriptors: *Water treatment, *Flexibility, *Federal-state water rights conflicts, *Water pollution control, *Governmental interrelations, Federal government, Local governments, Political aspects, Administration, Planning, Standards, Financing, Monitoring, Legislation, Law enforcement.
Identifiers: Federal Water Pollution Control Act Amendments of 1972, Organizational methods.

The Federal Water Pollution Control Act of 1972 (FWPCA) spelled out a partnership role between the federal and state governments that is a little more 'participating' than states would like. Although states have the primary role in pollution control, they are given detailed instructions, and strait-jacketed as they try to adapt to particular situations in their local areas. More progress could be made if the states were to be considered laboratories for innovative treatment methods and as workshops on administrative and organizational methods. If such a plan were adopted, a failure would be on a small scale and not a huge national disaster. A better way to approach the problem then, would be to set national but flexible standards, and provide funds and facilities for research and development. Plans and scientific changes should be the state's responsibility where it can be done more efficiently than under a rigid system of national controls. Monitoring effluents can also be handled better locally. Despite being hampered by a new plan, a new regulatory agency, and a complex law, the federal government appears to be moving toward this view. (Rieck-Florida)

GOVERNMENTAL INTEREST IN PROTECTING BEACH FROM ENVIRONMENTAL DAMAGE THROUGH OVERUSE OUTWEIGHS DUE PROCESS RIGHT TO BATH NUDE,
J. K. Vogel.
The Georgetown Law Journal, Vol 64, p 1171-85 (May 1976). 88 ref.

Descriptors: *Beaches, Ecology, *Recreation, *Massachusetts, *National parks, Social aspects, Judicial decisions, Constitutional law, Litter, Waste disposal, Legal aspects, Water law, Public access, Regulation, Seashores, Shores, Dunes, Environmental control, Social change, Social values, Recreation demand.
Identifiers: *Administrative regulations.

In William V. Hathaway the First Circuit Court of Appeals acknowledged that the constitutional right of personal liberty protected by the fifth amendment due process clause encompassed the right to bathe nude. The right, so based, is not a fundamental right and was limited to traditional nude beaches. The defendant National Park Service had sought to prohibit nude bathing on the beach in question in order to reduce litter and environmental damage caused by the beach's increasing popularity. The court concluded that the governmental interest in protecting the beach environment was sufficient to outweigh the bather's narrow right. The court did not apply the the rational basis test traditionally used in examination of non-fundamental rights although the same result would have been obtained. Rather, the court adopted a balancing approach weighing the rights and interests of the parties and subordinating the legislative judgement. Such scrutiny of the means might well result in undue judicial interference. The author suggests the equally practicable alternative means test as a more desirable approach to determining the relative rights or parties in such disputes. (Moorhouse-Florida)

OIL AND WATER--A NEW LOOK AT THE UNIFORMITY DOCTRINE,
F. W. Lewis.
Baylor Law Review, Vol 26, No 2, p 194-210 (Spring 1974). 68 ref.

Descriptors: State governments, Federal governments, *Oil spills, *Federal jurisdiction, *State jurisdiction, Constitutional law, Common law, Legal aspects, Political aspects, Judicial decisions, Legal review, Water law, International law, Foreign trade, International waters, Law of the sea, Oil pollution, Water pollution sources, Oil wastes, Foreign countries, Coasts, Shores, Legislation.
Identifiers: *Coastal waters, *Territorial seas(Jurisdiction), *Uniformity doctrine, *Admirality and maritime jurisdiction, Freedom of the seas, Federal judicial power, States' rights.

A serious problem facing the coastal states is the potential damage from oil spills by vessels or offshore facilities. The ability of states to legislate in order to protect themselves from such dangers seems limited. Article III, section 2 of the United States Constitution extends the federal judicial power to, ...'all cases of admirality and maritime jurisdiction.' Hence, the uniformity doctrine has existed as the main barrier to state action. Early cases showed the basis for the doctrine as the need for uniformity in (1) domestic or internal affairs, and (2) international law and foreign affairs. As to domestic affairs, courts will employ a balancing test, and view protection of a state's coastal region from the effects of oil pollution as highly compelling. Hence, a state law directed at domestic action will often be upheld. On the other hand, courts have been reluctant to subordinate the need for uniformity in international law and foreign relations to any state policy or interest. Given the possibility that the act of a state would be attributed to the nation as a whole, and would therefore justify reciprocal action by other nations, state legislation cannot predominate over federal with regard to foreign vessels. State legislation, however, remains effective against domestic vessels, and in all state waters which are not navigable waters of the U. S. (Moorhouse-Florida)

CAN A STATE EMBARGO THE EXPORT OF WATER BY TRANSBASIN DIVERSIONS,
Washington Univ., Seattle. School of Law.
C. E. Corker.
Idaho Law Review, Vol 12, No 2, p 135-52 (1976).

Descriptors: *Inter-basin transfer, *Governmental interrelations, *Interstate rivers, *Interstate compacts, *Equitable apportionment, *Prior appropriation, Colorado River, Columbia River, Interstate commissions, River basin commissions, Colorado River Compact, Governments, State governments, Water law, Rivers, *Diversion, Relative rights, Federal government, Interstate, Legislation, Regulation, California, Arizona, Idaho, Colorado River Basin, Constitutional law.
Identifiers: Boulder Canyon Project, Central Arizona Project, California Limitation Act, Commerce Clause, Congressional powers.

Two propositions support the view that a state cannot embargo the export of its water: (1) Congress can effectively authorize the diversion of any water supply in the United States, and (2) in the absence of an Act of Congress to the contrary, states can generally prohibit future projects diverting water from natural sources. The Supreme Court decision in Arizona v. California established the primacy of Congress in this area. The Court left the choice of proration, priority, or some other formula of allocation to the Secretary of Interior subject to modification of that discretion by an act of Congress. Congress later eliminated any doubts that the decision applied only to navigable groundwater. Furthermore, Congressional superiority with respect to any interstate river systems is squarely based on the Commerce Clause of the Constitution. The second proposition concerning powers exercisable by a state assumes the state has not induced other states to rely on exported water. Then, state legislation limiting or forbidding export by future diversion, not discriminatory in favor of intra-state exports, and clearly related to legitimate state purpose would survive Commerce Clause scrutiny. (Moorhouse-Florida)

AMERICAN SEDIMENTATION LAW AND PHYSICAL PROCESSES,
C. E. Busby.
Reprinted from Chapter VII, ASCE Manuals and Reports on Engineering Practice--No 54, Sedimentation Engineering, 1975, p 629-74. 8 fig.

Descriptors: *Sedimentation, *Deposition(Sediments), *Sediment distribution, *Sedimentation rates, *Legal aspects, Aggradation, Accretion(Legal aspects), Avulsion, Sediment transport, Fluvial sediments, Marine geology, Running waters, Common law, Reasonable use, Riparian rights, Riparian land, Surface waters, Erosion, Salinity.

The process of sedimentation includes weathering, erosion, transportation, deposition and consolidation and often involves legal problems. Of great significance is the issue of who controls the right to sediments suspended in flowing waters. The question assumes particular importance when one realizes such sediments are valuable as mineral and organic fertilizer. Another difficult problem concerns the determination of legal damage caused by sediments when natural flow rates are upset by artificial flow rates induced by man. A precise determination of how much damage is due to sedimentation and how much is due to other causes becomes impossible. The law of sedimentation is derived from two legal sources--the civil and common law. Both sources stress uniformity and stability, but often overlook apparent scientific fact. The engineering and the legal professions could benefit by developing and applying basic scientific data within the broad framework of legal administrative processes and standards of fair play. Definitions of water supplies, sedimentation, saline processes, and theories of property ownership and use should be promptly brought within the realm of current scientific reality. (Moorhouse-Florida)

THE NATIONAL CONFERENCE ON WATER.
Reclamation Era, Vol 61, No 2, p 1-4, 14-18 (1975). 8 p, 4 photo.

Descriptors: *Conferences, *Water resources development, *Water allocation(Policy), *Water users, *Water utilization, Water values, Water law, Water control, Water policy, Water management(Applied), Water costs, Water demand, Water conservation, Federal government, State governments, Governmental interrelations, Water quality, Water rights.

The National Conference on Water, a gathering of experts sponsored by the Water Resources Council, had two primary goals: (1) to examine the role of water in national affairs through 1985; and (2) to consider the adequacy of existing and proposed programs. The conference discussed the wide variety of national objectives concerning the uses of water and how they are in completion, yet need not be incompatible. The conference suggested that the most significant changes in existing water law must come from the states because the greatest amount of water law is state property law. Legislative suggestions for determining water use priorities were presented. The conference examined the trend toward urban population concentration and the resulting water program emphasis. While an urban water policy is certainly encouraged, participants urged that there must also be examination of present and future needs for food, fiber and energy production. Summaries of two of the eight panel sessions were included: Water Laws, Water Rights, and Institutional Arrangements; The Role of Federal, State, and Local Governments. The Experts all agreed that the nation can no longer be complacent about its most basic natural resource. (Welch-Florida)

BOUNDARIES OF THE COASTAL ZONE: A SURVEY OF STATE LAWS,
Louisiana State Univ., Baton Rouge. Sea Grant Legal Program.
J. M. Robbins, and M. J. Hershaw.
Coastal Zone Management Journal, Vol 1, No 3, p 305-331 (1974). 27 p, 83 ref, 2 append.

Descriptors: *Coasts, *Shore protection, *Submerged Lands Act, *Boundaries(Property), Federal government, State governments, Governmental interrelations, Shores, Legislation, Tidal waters, Political aspects, Jurisdiction, Roads, Highways, Vegetation, Elevation, Topography, Tides, Tidal effects, Water level fluctuations.
Identifiers: *Coastal Zone Management Act of 1972, *Coastal zone management, Coastal management statutes, Wetlands statutes, Shorelands statutes, Inland boundaries, Seaward boundaries, Boundary delineation.

The Federal Coastal Zone Management Act provides monetary grants to coastal states developing coastal zone management programs. The Act requires each state program to identify the boundaries of the coastal zone subject to management program. Three aspects of the coastal zone must be clearly identified: (1) a seaward limitation; (2) coastal formations or physical features present in the coastal zone; and (3) inland boundaries. Seaward boundaries are generally prescribed by the Submerged Lands Act. Coastal features and inland boundaries for 24 states are analyzed under three types of statutes: (1) coastal management statutes (Alabama, California, Delaware, Florida, Louisiana, Mississippi, New Jersey, Oregon, Rhode Island, and Texas); (2) wetlands statutes (Connecticut, Georgia, Hawaii, Maine, Maryland, Massachusetts, New Hampshire, New Jersey, New York, North Carolina, Rhode Island, Virginia, and Washington); and (3) shorelands statutes (Hawaii, Maine, Michigan, Minnesota, Washington, and Wisconsin). Boundary delineation is made according to various factors including linear measurements, political boundaries, roads and highways, vegetation, elevation, and tidal flow. An appendix and chart are provided containing state provisions relating to boundary-delineation techniques. (Caudill-Florida)

RECREATIONAL USE OF TEXAS RIVERS--RECOMMENDATIONS FOR ADOPTION OF THE TEXAS PUBLIC RIVERS ACT,
S. B. Biggs.
St. Mary's Law Journal, Vol. 7, No. 3, p. 575-93 (1975).

Descriptors: *Rivers, *River beds, *Texas, *Public access, Easements, Trespass, Bodies of water, Water law, Legal aspects, Judicial decisions, Rio Grande River, Banks, Inland waterways, Streams, Streambeds, Navigable rivers, Fishing, Recreation, Camping, Campsites, Lakes, Riparian rights, Eminent domain, Public rights, Water rights, Boundary disputes, State governments, Legislation.
Identifiers: *Texas Public Rivers Act, Texas Open Beaches Act, Litter.

Texas is plagued by conflict over the respective rights of riparian landowners and recreationists in its over 80,000 miles of inland waterways. The Texas Public Rivers Act of 1973, a proposed codification of Texas water law, was never reported out of committee, but it did present viable solutions to the conflict between recreationists and landowners. The Act would prohibit the erection of obstructions which might impede travel along a navigable river except where fencing was reasonably necessary to contain livestock. Administrative criteria for reasonableness would include a determination of low and high-water levels and the use of the riparian land. Furthermore, the Act would allow a reasonable use of river banks as an incident of recreational navigation thus resolving the conflict between common law's mean high water line boundaries and civil law's public servitudes on all river banks and permitting land passage around obstructions in the river. Camping and picnicing would still be limited to lands below the mean high water mark. The problem of extremely limited access to public waters is partially resolved by a provision authorizing acquisition of private lands. However, as this would prove financially prohibitive, development of existing public lands is recommended. (Moorhouse-Florida)

SNAKE RIVER LAND CO V STATE BOARD OF CONTROL (BENEFICIAL USE OF WATER HELD SUFFICIENT PROOF OF APPROPRIATION).
560 P.2d 733-39 (Wyo Sup Ct 1977).

Descriptors: *Wyoming, *Appropriation, *Administrative agencies, *Beneficial use, *Water permits, Irrigated land, Permits, Local governments, State governments, Judicial decisions, Water policy, Water law, Diversion, Water rights, Water resources, Water utilization, Water allocation(POlicy), Water use, Water conservation.

Land company appealed the judgment of the district court which affirmed the decision of an administrative board denying the company's petition to cancel a permit allowing diversion and appropriation of certain state water. Appellant based its appeal on the fact that appellees failed to file a notice of beneficial use as required by statute. Appellant contended that this made the permit invalid. The state supreme court found that although current state law requires such a filing within five years after a specified date, that at the time this permit was issued there was no time limit for submitting proof of appropriation. The court further found that the statute relied upon by the appellant provides a notice procedure which must be complied with before forfeiture can occur. No such procedure had been initiated by the state. Accordingly, since there was substantial evidence that the water had been put to beneficial use for reduced acreage since the issuance of the original permit, the judgment was affirmed. PONCE DE LEON CONDOMINIUMS V DIGIROLAMO (DEVELOPER RESPONSIBLE FOR CONTROL OF SURFACE RUNOFF).
232 S.E.2d 62-67 (Ga. Sup Ct 1977).

Descriptors: *Runoff, *Discharge(Water), *Drainage systems, *Surface runoff, *Georgia, Surface waters, Ponding, Silts, Drainage, Routing, Legal aspects, Water law, Sedimentation, Silting, Judicial decisions, Water control, Water injury, Surface drainage, Damages.
Identifiers: *Liability, *Property interests.

Plaintiff landowner brought suit against defendant developer claiming that the development of condominiums adjacent to the plaintiff's property caused the property to receive unnaturally large quantities of surface water. The lower court awarded damages, injunctive relief, and attorneys fees to the plaintiff. The defendant developer appealed. The record showed that at the inception of the project the plaintiff complained to the defendant that the development would result in increased discharge of surface water onto his property. Defendant took no action at that time. The plaintiff then experienced a runoff problem which resulted in the pooling of water and silt on the plaintiff's property. Plaintiff again complained and defendants partially remedied the problem by installing sedimentation ponds. The injury had found that the defendant acted with conscious indifference in his failure to remedy the situation entirely by rerouting the drainage system. The state supreme court found no error of law, and held that the evidence supported the verdict. (Petruff-Florida)
W77-08136

FARMERS INVESTMENT COMPANY V BETTWY (DOCTRINE OF REASONABLE USE AS APPLIED TO GROUNDWATERS).
558 P.2d 14-27 (Ariz 1976).

Descriptors: *Arizona, *Groundwater resources, *Reasonable use, *Competing uses, Water supply, Water table, Water wells, Groundwater basins, Subsurface waters, Farms, Irrigation, Percolating water, Common law, Legal aspects, Water law, Mining, Municipal water.
Identifiers: *Groundwater management.

The incorporated owner of farm lands in the Sahuarita-Continental Critical Groundwater Area filed suit against mining companies to enjoin them (1) from taking waters beneath the critical area and using them on lands other than where they were taken; and (2) from completing the drilling of a deeper well that would deplete the water supply. The City of Tucson, which obtained much of its municipal water from wells downstream from the lands owned by the parties, intervened in the suit to enjoin both parties from returning water to the groundwater system that was so changed in quality as to render the domestic supply undesirable. The Superior Court denied plaintiff's and City's application for injunction and enjoined City from increasing the amount of water it pumped and transported away from the subdivision. Upon appeal by the City and the plaintiff, the Supreme Court upheld the injunction against the City and granted an injunction against the mining companies, holding that the doctrine of reasonable use does not permit percolating waters to be used off the lands from which they are pumped if others whose lands overlie the common supply are injured or damaged thereby. MC CARDEL V SMOLEN (THE RIGHTS OF RIPARIAN AND NONRIPARIAN OWNERS TO RECREATIONAL USE OF NAVIGABLE INLAND LAKES).
250 N.W.2d 496-502 (Mich 1977).

Descriptors: *Michigan, *Riparian rights, *Lake shores, *Public access, Boat launching, Ramps, Boating, Legal aspects, Public rights, Access routes, Recreation, Recreation demand, Lakes, Navigable waters, Inland waterways, Judicial decisions.
Identifiers: *Non-riparian owners, *Exclusive rights, *Ownership, Servitude, Navigational servitude, Incidental rights.

An action was brought to determine the ownership of riparian rights in a strip of land, which was designated on a 1911 plat as a 'boulevard' and was dedicated to the county essentially as a public street, but which was actually only undeveloped beach property. The Michigan court defined plaintiffs lakefront landowners' riparian rights, as well as the rights of defendants, non-lakefront landowners. The court held that the plaintiffs owned the riparian rights in the boulevard frontage and, that as a result of their riparian rights, plaintiffs had exclusive right to erect or maintain docks and boat hoists along the shore. However, plaintiffs could not prevent defendants from lounging or picnicking on the boulevard so long as defendants did not unreasonably interfere with the private and

public rights of plaintiffs. The reason for the ruling is that although plaintiffs are riparian owners of the shore of the navigable inland lake and, as such, own the bottom of the lake to its center, their title is subordinate to the public's navigation rights so long as the public has a lawful means of access to the lake. Incidental to the public's navigational servitude is the right to boat, fish and swim. Therefore, the public boulevard along the lake, provided defendants with access to the lake which in turn conferred accompanying recreational privileges on them. (Denker-Florida)

STATE V. MATZEN (USE OF HISTORICAL MAPS TO SETTLE CLAIMS TO ACCRETION LANDS).
250 NW2d 232-34 (Neb. 1977).

Descriptors: *Nebraska, *Accretion(Legal aspects), *Land forming, *Surveys, Real property, Boundary disputes, Maps, Geologic investigations, Geologic mapping, Judicial decisions, Geological surveys, Missouri River, Rivers, Legal aspects, Movement.
Identifiers: *Quiet title, *Title extinguishment, Ownership, *Property disputes, Expert witnesses.

Plaintiff state of Nebraska brought action to quiet title to accretion land along the Missuouri River. Defendant landowners claimed that the land in dispute accreted to an island tract owned by them and therefore title to accretion land should rest with them. Plaintiff contended that defendant's land was obliterated during the westward movement of the river, and that the effect of such movement was to destroy title to the land. Plaintiff's theory is that when the river moved back eastward, accretion land formed along the west bank, and that this land is the property of the state. An 1857 General Land Office map, and 1879 Army Corps of Engineers map, an 1884 Atlas map and an 1894 county surveyor's map showed the gradual development of the accreted land in question. Expert geological witnesses were called to interpret the maps. The experts concluded that the accretion land formed as the river moved east was accretion to defendant's land and not to plaintiffs state's tract. The lower court quieted title in defendants and the judgment was affirmed on appeal to the Nebraska Supreme Court. (Denker-Florida)

SALE OF WATER RIGHTS,
Idaho Code Ann secs 42-2601 thru -2608 (Supp 1976).

Descriptors: *Idaho, *Irrigation permits, *Water works, *Water permits, *Water contracts, Water management(Applied), Water rates, Water costs, Water transfer, Water delivery, Water distribution(Applied), Permits, Appropriation, Irrigation, Irrigation programs, Water rights, Water policy.

All owners of irrigation works or reservoirs, dams, canals, or other structures used for conserving or furnishing water for irrigation purposes in the state of Idaho shall petition the department of reclamation for a certificate to sell any water rights in such works. The petition must include a map and other information from which the department can determine the location of the works, the lands to be reclaimed, plans regarding any intended construction, capacity of the works, the number of acres which may be irrigated, names of parties, and terms of the proposed sale. After making necessary on-site inspections, the department shall evaluate the petition and finally issue a certificate to owners of the works. The certificate, which must be filed with the county records, shall indicate the number of water rights which may be sold, the number of acres which may be irrigated, and the form of the contract or deed to be issued to the purchaser. Certificates will not be issued unless the department has considered data and records of stream flow and water supply pertaining to the water to be sold, covering a period of five years. W77-08140

DEPARTMENT OF WATER RESOURCES,
Idaho Code Ann, secs 42-1701 thru -1738 (Supp 1976).

Descriptors: *Resources development, *Idaho, *Water resources development, Water storage, Water supply, Water conservation, Permits, Water policy, Water permits, Water management(Applied), Dam construction, Dam failure, Damsites, Dams, Operation and Maintenance, Reservoir construction, Reservoir operation, Reservoir sites, Reservoir design.

The Idaho legislature herein creates a department of water resources. It is the intent of the legislature to provide for the exclusive state regulation of the construction, maintenance, and operation of all dams and reservoirs within the state. Permits must be obtained by persons desiring to construct or alter dams. Owners of dams must perform tests necessary to enable the state inspector to determine whether conformity with state safety standards is being secured. The department is vested with emergency powers enabling it to assume control over the operation of dams which pose immediate threats to life or property. A water resources board is created to coordinate a program which will achieve conservation, development and optimum use of state water resources. The board is vested with broad contractual powers. Specific criteria to guide the board in the achievement of its statutory goals are delineated. The board must approve all significant reservoir project proposals. Maximum economic development of waters involved, conservation of water, flood control, protection of all vested rights, and the prevention of waste are criteria considered in determining whether the reservoir project shall be carried forward. (Josepher-Florida)
W77-08141

WITHDRAWAL OF CERTAIN WATERS FROM APPROPRIATION: SPECIAL MUNICIPAL AND COUNTY WATER RIGHTS,
Ore. Rev. Stat secs 538.010 through .450 (1973).

Descriptors: *Oregon, *Withdrawal, *Diversion, *Columbia River, Legal aspects, Water law, Legislation, Prior appropriation, Recretion, Water utilization, Fish conservation, Fish management, Water rights, Priorities, Condemnation, Parks, Unappropriated water, Streams, Lakes, Municipal water.
Identifiers: *Withdrawn waters, Vested rights.

The diverted waters of Oregon's Ditch Creek, now a part of Willow Creek, are subject to the same rights of appropriation as the original Willow Creek. Morrow County is licensed to divert and store the waters of Ditch Creek and authorized to obtain the property rights necessary to effectuate those rights. The waters of certain other creeks are withdrawn from appropriation or condemnation, except for park purposes, in order to preserve recreational and scenic resources. The waters of Diamond Lake, Lake of the Woods, Hackett, Johnson, Mill, Barr, McNulty, and Milton Creeks, the Rogue River, and the tributaries of the Columbia River are similarly withdrawn in order to protect fish life therein. None of the above withdrawals shall affect vested appropriations. In most instances, the legislature made further exceptions for domestic and various other specific appropriations. All rights to water for municipal water supplies which were acquired before 1909 are confirmed, and certain exclusive rights of water use for municipal purposes are granted. (Moorhouse-Florida)
W77-08142

BELFORD V. CITY OF NEW HAVEN (INDIVIDUAL'S CHALLENGE TO CITY'S DREDGING AND CONSTRUCTION),
364 A.2d 194-200 (Conn. 1976).

Descriptors: *Connecticut, *Dredging, *Recreation facilities, *Environmental effects, Local governments, Channel improvement, Adjacent landowners, Contracts, Public rights, Water sports, Boating, Project planning, Construction, Parks, Natural resources, Facilities, Recreation.
Identifiers: Standing(Legal).

Plaintiff residents sought to enjoin defendant city from constructing rowing course and other facilities on public park land. City had entered into an agreement with private corporation for lease and construction of complete Olympic facilities on city park premises. The park already contained athletic facilities, including an old rowing course, and the proposed facilities would have nearly unrestricted public use. The affected area had limited wildlife value and minimal damage to resources was anticipated. Proposed dredging for the rowing course would cause no permanent damage. Plaintiffs claimed that the proposals constituted a diversion of park lands from proper park purposes, and charged that the construction would result in pollution and destruction of the city's natural resources. The court concluded that only parties with damage distinct from that suffered by the general public had standing to sue for a diversion from park purposes, and that the plaintiffs had no such distinct damage. Under the Connecticut Environmental Protection Act, any person may bring an action for relief against pollution. Here no possible pollution was shown. Nevertheless, the city was directed to get proper approval before proceeding with work in the tidal wetland area. (Molloy-Florida)
W77-08143

WOOD V. BOARD OF COMMISSIONERS FOR THE PONTCHARTRAIN LEVEE DISTRICT (LAND APPROPRIATION FOR LEVEES),
338 So.2d 744-47 (La, Ct. App. 1976).

Descriptors: *Louisiana, *Eminent domain, *Levees, *Flood control, State governments, Condemnation, Condemnation value, Levee districts, Public rights, Local governments, Water transfer, Drainage systems, Water policy, Water zoning, Legal aspects, Taxes, Real property.
Identifiers: *Groundwater management.

Plaintiff sought recovery of the value of two parcels of vacant land which defendant levee board used to construct or enlarge levees along two separate canals. Both parcels were obtained by plaintiff through tax redemption and quit claim deeds from the tax debtor. The trial court awarded judgement for the plaintiff for the value of the lands in 1949 when the levees were constructed, and plaintiff contended the judgement should be for the amount of land value in 1962 when he discovered the taking. The plaintiff was found correct in his contention that there had never been an attempt by the defendant to acquire a right to either parcel. However, the court found that fact unimportant since the title was in the state, by virtue of the tax delinquency, at the time the land was appropriated. There was no necessity for an express dedication to public use, since the land was not privately owned. The plaintiff's tax redemption was defective and subject to the previous dedication for levee purposes. Since only the plaintiff appealed, his request for increase of the award was refused. (Molloy-Florida)
W77-08144

MITCHELL V. CITY OF HIGH POINT (MUNICIPAL LIABILITY FOR DAMAGE FROM OVERFLOW OF PRIVATELY-OWNED STREAM).
228 S.E.2d 634-37 (N.C. Ct. App. 1976).

Descriptors: *North Carolina, *Flood damage, *Local governments, *Drainage, Right-of-way, Drainage practices, Ditches, Paving, Streams, Urban drainage, Legal aspects, Surface drainage, Overflow, Flash floods, Culverts, Water control.

Plaintiff landowners sought recovery for property damage suffered in a flood, and alleged defendant city's failure to maintain drainage system in good condition. A creek flows near plaintiff's property and under defendant's road through two culverts which are maintained by the city. The flood was caused by debris blocking the culverts, and plaintiffs contend that defendant had adopted the natural waterway as part of its drainage system such that a duty of inspection and maintenance was created. The city's right to improve streets was noted by the court to be subject to liability for concentrating waters into artificial drains and throwing the waters onto lands and causing injury. However, there was no evidence that the city augmented the flow of water in this case. Controlling and maintaining of culverts under the street did not mean that the city adopted the stream, nor did it constitute a dedication of a private stream to public use. The city exercised no legal control over the stream bed except the road right-of-way, hence the city had no duty regarding other portions of the stream bed and admission of evidence regarding the condition of other portions was prejudicial error. (Molloy-Florida)
W77-08145

SOLAR SALT COMPANY V SOUTHERN PACIFIC TRANSPORTATION COMPANY (ALTERATION OF SALINE CONTENT OF GREAT SALT LAKE IS NOT POLLUTION UNDER UTAH STATUTE).
555 P2d 286-93 (Utah 1976).

Descriptors: *Utah, *Great Salt Lake, *Saline lakes, *Salinity, *Saline water, Bodies of water, Lakes, Salt balance, Judicial decisions, Pollution, Legal aspects, Diversion, Water law, Appropriation, Brine shrimp, Structures, Algae, Competing uses.
Identifiers: *Causeways, *Property rights.

Plaintiff salt production company brought action against defendant railroad to recover for damages resulting from decreased salt content in portion of Great Salt Lake allegedly caused by the construction and maintenance of causeway. The causeway diverted waters entering the lake in such a way as to raise the saline content of the water in the northern portion of the lake, and reduce it in the southern portion. Plaintiff salt mining company sued on the grounds of nuisance, contending that by raising the salinity in the northern part of the lake, the defendant railroad had violated the Utah Pollution of Waters Act. The act includes in its definition of pollution 'any alteration' of the waters of the state as will 'render such waters harmful'. The Utah Supreme Court affirmed the summary judgment granted by the Third District Court of Salt Lake County. The court held that lowering the salt content of water is not a public nuisance, as the interests of the general public are not affected; nor is it pollution as defined by the statute. The court added that if the statute meant that lowering the salt content was a public nuisance, then the salt company itself would be guilty of a public nuisance whenever it removed salt from the lake's waters. (Sloan-Florida)
W77-08146

SIERRA CLUB V STAMM (NATIONAL ENVIRONMENTAL POLICY ACT DOES NOT REQUIRE COMPREHENSIVE ENVIRONMENTAL IMPACT STATEMENT ON LARGE RECLAMATION PROJECT WHEN EIS HAVE BEEN PREPARED FOR VIABLE PORTION OF PROJECT).
6 ERC 1848-54 (D Utah June 21, 1974).

Descriptors: *Environmental effects, *Utah, *Federal jurisdiction, *Environmental control, *Cost-benefit analysis, Water quality control, Economic impact, Economic prediction, Economic justification, Economic feasibility, Cost analysis, Water pollution control, Water districts, Reclamation, Projects, Legal aspects, Regional economics.
Identifiers: *National Environmental Policy Act, *Environmental Impact Statement, *Injunctive relief.

Plaintiff environmental groups brought this action against defendant federal officers and employees to enjoin continuing construction on the Bonneville Unit of the Central Utah Project, a partially constructed reclamation project designed to develop and provide water for beneficial uses in the state of Utah. Plaintiff contends that defendants failed to comply with the National Environmental Policy Act (NEPA) when they filed an inadequate final environmental statement (FES), which did not consider alternatives, nor contain an economic or cost-benefit analysis. Plaintiffs further allege that the FES was too narrow in scope since it did not cover all phases of the project. The district court held that plaintiffs failed to show by a preponderance of the evidence that any reasonable alternative was not considered and discussed in the FES, and that it did contain a rigorous exploration of alternative actions. The court found that neither NEPA nor the Council on Environmental Quality (CEQ) Guidelines require a benefit-cost analysis in monetary terms of the beneficial and adverse effects on the environment. The FES submitted herein fully and adequately describes and analyzes the significant secondary consequences resulting from the project, and is in compliance with NEPA and CEQ guidelines. Furthermore, the requirements of NEPA are satisfied by the preparation of separate impact statements that assess the environmental effect of each independent portion of the project. (Welch-Florida)
W77-08147

NATURAL RESOURCES DEFENSE COUNCIL V STAMM (NATIONAL ENVIRONMENTAL POLICY ACT NOT SATISFIED WHEN EIS FAILS TO DISCUSS ALL REASONABLE ALTERNATIVES TO THE PROJECT).
6 ERC 1525-34 (E D Cal April 26, 1974).

Descriptors: *California, *Construction, *Dam construction, Dams, *Regulation, Alternative planning, Water law, Water pollution control, Water demand, Water conveyance, Water storage, Water resources development, Water quality control, Water levels, Water management(Applied), Cost-benefit analysis, Project planning, Damsites, Flood control, Flood data, Flood protection.
Identifiers: *National Environmental Policy Act, *Injunctive relief, *Environmental impact statement.

Plaintiff environmental group brought this action against defendant federal officers and agents seeking a preliminary and permanent injunction to halt construction on the Auburn Dam portion of the Auburn-Folsom South Unit. Plaintiffs contend that defendant's planned construction and operation of the Unit in violation of the act authorizing such construction, and secondly, that the Environmental Impact Statement (EIS) concerning the Unit failed to comply with the requirements of the National Environmental Policy Act (NEPA) by failing to disclose the mode of operation of water release operations, failing to disclose the growth inducing impacts of the water contracting and pricing policies, and failing to discuss alternative sources of water. The district court held that the burden of proof fell upon plaintiffs, but that in this case plaintiffs had sustained that burden and that NEPA was not satisfied by the EIS submitted. The EIS was legally insufficient since it lacked a critical analysis of the alternatives available to achieve flood control. The court further noted that the EIS failed to discuss either the water contracting policies or the cost-ratio discussed in the original feasibility studies. An EIS must contain a discussion of reasonable alternatives to a proposed project in a detailed and well reasoned manner in order to qualify as a good faith statement of facts as required under NEPA. (Welch-Florida)
W77-08148

MICHIGAN CONFERENCE ASSOCIATION OF SEVENTH-DAY ADVENTISTS V COMMISSION OF NATURAL RESOURCES (PRIVATE LAKES WITH NO OBVIOUS PUBLIC ACCESS CLOSED TO THE PUBLIC).
245 Nw2d 412-14 (Ct App Mich 1976). 3 p.

Descriptors: *Michigan, *Lakes, *Navigable waters, *Non-navigable waters, *Riparian rights, Judicial decisions, Legal review, Legal aspects, Streams, Boundaries(Property), Recreation, Public rights, Public access, Social aspects, Recreation demand.
Identifiers: *Lake Shellenbarger(Mich), Private lakes.

Plaintiff is the owner of a tract of land which includes a 100-acre lake. The lake has no inlet, as it is spring fed, and only a small creek outlet. The small creek outlet is possibly navigable by a small boat. Plaintiff owns all land surrounding the lake and all land on both sides of the outlet stream up to a certain public highway. Plaintiff sued for and received a declaratory judgment that his lake was non-navigable, private and not subject to use by the general public. Defendant, the Michigan Commission of Natural Resources, challenged the ruling on appeal. The appellate court affirmed the declaratory judgment in Plaintiff's favor. Relying on established Michigan precedent, the court determined that the public may be excluded from a privately owned lake to which there is no readily apparent public access. The fact that the creek outlet may have been navigable was found to be unimportant. The court concluded that the availability of access by water to a lake which is otherwise private does not necessarily mean that the lake is open to public use. (Moorhouse-Florida)
W77-08149

UNITED STATES V OSAGE COMPANY (REMOVAL OF SUNKEN BOATS OBSTRUCTING NAVIGABLE WATERS OWNER'S RESPONSIBILITY).
414 F Supp 1097-1103 (W D Pa 1976).

Descriptors: *Pennsylvania, *Ships, *Submergence, *Judicial decisions, Navigable waters, Rivers, Negligence, Barges, Penalties(Legal), United States, Governments, Costs, Water law, Salvage value, Legal aspects, Obstruction to flow, Streamflow, Federal government.
Identifiers: *Navigation obstructions.

The United States Government, as plaintiff, brought an action against a barge owner to recover the cost of removing a sunken barge and for civil penalty. Defendant corporation alleged that the ship sank through no fault of its own, and therefore that it was not liable for the removal cost incurred by the Government. Defendant-owner failed to present any evidence providing that the barge left the mooring site by accident or by innocent misfortune. The United States District Court found that the barge constituted an obstruction in navigable water, and that the owner was required to prove that the sinking of the barge did not occur through its negligence, and that opinion evidence of nonnegligence was not sufficient to rebut the presumption of negligence. The Court also held that the owner of the barge was liable for the cost of removal incurred by the Government, but that civil penalty would not be imposed against it. (Martin-Florida)
W77-08150

UNITED STATES V TULARE LAKE CANAL COMPANY (RECLAMATION LAWS CONCERNING SALE OF LAND IN EXCESS OF 160 ACRES).
535 F2d 1093-1144 (9th Cir 1976).

Descriptors: *Water delivery, *Federal reclamation law, *Irrigation programs, *Land tenure, *Cost repayment, Dams, Multiple-purpose projects, Reclamation, Water, Contracts, Federal government, Water storage, Water rights, Economics, Irrigation, Farms, Pricing, Value, Land appraisals, Legislation, Construction costs, Legal aspects, Canals.

Plaintiff federal government sought to enjoin defendant canal company from delivering water from a reclamation project to any owner of land in excess of 160 acres unless the owner had executed a recordable contract with the Secretary of Interior requiring him to sell his excess acreage at a price which excluded the enhancement value due to the project. The plaintiff contended that such land owners were bound by Section 46 of the 1926 Onnibus Adjustment Act requiring the contract. The defendant contended that its repayment of a portion of the construction costs of the reclamation project exempted the land owners from Section 46. The district court held for the defendant. The Ninth Circuit Court of Appeals reversed. After an in depth examination, the court said the 1944 Flood Control Act did not exclude this project from the acreage limitation of the reclamation laws. The court also rejected the defendant's contention that repayment of construction costs exempted the landowners. The court said this would thwart the congressional purpose of discouraging land speculation in the project area. (Capehart-Florida)
W77-08151

CANADIAN PACIFIC (BERMUDA) LIMITED V UNITED STATES (NO DUTY TO SURVEY OR DREDGE CHANNEL AT ANY PARTICULAR TIME).
534 F2d 1165-70 (5th Cir 1976).

Descriptors: *Shoals, *Accidents, *Navigable waters, Ships, Channel improvement, Florida, Negligence, Dredging, Channels, Rivers, Damages, Legal aspects, Federal government, Surveys, Sand bars, Navigation, Sounding, Judicial decisions.
Identifiers: Proximate causation, Navigation obstructions, River pilots.

Plaintiff ship owner sought damages in admiralty from defendant United States for negligent maintenance of a waterway. The plaintiff's ship ran aground on a shoal in the St. John's River. The Corps of Engineers had surveyed the section of the river in question and had knowledge of the shoaling condition. The plaintiff contended that the defendant had a duty to advise the pilot's association of the shoaling condition. The plaintiff further contended that the defendant had a duty to dredge the river so as to eliminate the shoals. The trial court entered judgment for the plaintiff. The United States 5th Circuit Court of Appeals reversed; holding that the federal right of regulation of navigable waterways does not imply a duty of federal maintenance of such waterways. Noting the pilot's testimony that he would not have navigated the ship differently if he had had the defendant's information, the court further held that the defendant's failure to notify the pilots was not a cause of the accident. (Capehart-Florida)
W77-08152

COMPLIANCE WITH THE PROVISIONS OF THE FEDERAL WATER POLLUTION CONTROL ACT AS AMENDED IN 1972.
Cal Water Code Ann secs 13370 thru 13382 (West Supp 1976).

Descriptors: *California, *Water pollution control, *Permits, *Interstate rivers, State governments, Legal aspects, Control, Legislation, Water quality, Federal government, Pollutants, Governmental interrelations, Penalties(Legal), State jurisdiction, Political aspects, Social aspects, Regulation, Management, Water treatment, *Federal Water Pollution Control Act.
Identifiers: *Water discharge requirement, Injunction(Prohibitory), Licenses, Notice, Effluent limitations, Administrative regulations, Certification.

California, pursuant to the Federal Water Pollution Control Act (FWPCA), has established a permit system to regulate the discharge of pollutants into the navigable waters of the United States. The discharge of any radiological, chemical or biological warfare agent into state waters is flatly prohibited. Any person who discharges other pollutants into state waters is required to submit a request for a waste discharge requirement. Such waste discharge requirements will be issued only after proper notice, and only for a five year period. All interested parties are afforded an opportunity to be heard. Water discharge requirements may be terminated for violation of the terms of the requirement, obtaining such requirement by misrepresentation, or a change in conditions which requires the elimination of a particular discharge. In addition, civil and criminal penalties are provided for violation of the waste discharge requirements. The statute requires that waste discharge requirement holders implement the best pollution control technology by 1977 and also meet any further technological advancement by 1983. (Moorhouse-Florida)
W77-08153

WELLS, PUMPING PLANTS, CONDUITS AND STREAMS,
Cal Water Code Ann secs 7000 thru 7075 (West 1971).

Descriptors: *California, *Conduits, *Legal aspects, *Canals, *Streams, Streamflow, Conveyance structures, Irrigation canals, Canal seepage, Diversion structures, Judicial decisions, Water law, Legislation, Water permits, Natural streams, Bridges, Wells, Canal design, Ditches.
Identifiers: Citizen suits, Standing(Legal), Surface mining, Dredging operations.

Any persons associated in the use of a conduit, well, or pumping plant are liable for the reasonable expenses of repair and maintenance in proportion to their actual use thereof. Any person paying more than his share of such expenses may bring an action for contribution against a non-paying user, and for a declaration of rights of the respective water users to determine the proportionate expenses of each. California has further provided that any resident or freeholder in a road district may, upon filing of the required bond, petition for the opening or alteration of a canal for the convenience of one or more residents of such district. However, no canals or other conduits may be laid so as to obstruct any highway. Every conduit built across a pre-existing highway must comply with county and state standards. All conduits in place for more than thirty years, and all approved bridges, shall be maintained and improved by the public agency having jurisdiction over the highway. In contrast, the flow of water of any stream to the intake of any canal for public or agricultural use may be maintained by the person in charge of the use. Such maintenance, shall not, however, prevent the maintenance or building of reclamation or flood control levees or the use or enlargement of any natural channel for municipal purposes. The alteration of the course of any stream in a surface mining dredging operation, without prior approval is expressly prohibited. (Moorhouse-Florida)
W77-08154

BEAR RIVER COMPACT,
Utah Code Ann secs 73-16-1 thru -2 (1968).

Descriptors: *Idaho, *Utah, *Wyoming, *Water rights, Legislation, Water utilization, Administration, State governments, Legal aspects, Regulation, Water law, Institutions, Interstate, Water policy, Water resources development, Projects, Planning, Reservoirs, Jurisdiction, Priorities, Prior appropriation, Water storage, Eminent domain, Condemnation, Canals, Interstate compacts, Governmental interrelations.
Identifiers: *Bear River Compact(Ida-Uta-Wyo).

Idaho, Utah and Wyoming have agreed to the Bear River Compact, which sought to remove the causes of controversies over the distribution and use of the waters of Bear River. The participants in the compact were concerned about the efficient use of water, additional development of water resources, and promoting interstate comity. The Bear River Commission was established for the purpose of setting policy, adopting laws, rules and regulations and investigating, constructing and operating projects providing for the maximum beneficial use of the water. Procedures regarding water emergencies and storage rights in reservoirs are set forth in the text of the compact. Each signatory state can acquire water rights in one state for use of water in another state provided the exercise of eminent domain shall be in accordance with the law of the state in which such property is located, and any facilities constructed shall be subject to the law of the state where the facility is located. Compact provisions are to be reviewed every twenty years, but can be terminated at any time by the unanimous agreement of the signatory state. (Hadoulias-Florida)
W77-08155

BOARD AND DIVISION OF WATER RESOURCES,
Utah Code Ann. secs. 73-10-1 thru -4 (Supp. 1975).

Descriptors: *Utah, *Water conservation, *Water utilization, Legislation, Administration, Governments, Legal aspects, Regulation, Water law, Institutions, Interstate, State governments, Water policy, Water management(Applied), Water resources, Water resources development, Water yield improvement, Competing uses, Water contracts, Reclamation, Economics, Administrative agencies, Projects, Underground streams, Streams.

The Utah state legislature reaffirms the state public policy of managing the water resources so that they can be put to the highest use for public benefit, including domestic uses and irrigation of lands. The legislature urges co-operation with state and federal agencies to obtain maximum yields from underground waters and small streams, creating a revolving fund so that every mountain stream and water resource can be made to render the highest beneficial service, and constructing projects to increase the beneficial use of water. The Board of Water Resources, consisting of seven members appointed by governor, has been created, and shall assume the responsibilities previously performed by the Utah Water and Power Board. Additional powers and duties include authorizing studies for the promotion of water and power resources, power to enter into contracts for construction of conservation projects, to sue and be sued, to contract with federal and other agencies, and to consider and recommend on behalf of the state regarding reclamation projects or water development projects by state or United States agencies. (Hadoulias-Florida)
W77-08156

BOOM COMPANIES: CONSTRUCTION, POWERS OF,
W Va Code Ann secs 31-3-1 thru 31-3-11 (Supp 1975).

Descriptors: *West Virginia, *Lumbering, *Streams, Legislation, Dams, Water law, Administration, State governments, Local governments, Rivers, Access routes, Saw mills, Facilities, Legal aspects, Water rights, Penalties(Legal), Banks, Surface waters, River flow, Tributaries, Streamflow.
Identifiers: *Booms, Intentional torts.

Any corporation, incorporated in West Virginia for the Express purpose of boom construction is authorized to construct booms in the rivers and streams of the state, wherever such booms are necessary to stop and secure boats, rafts, logs, mosts, spars, lumber and other timber. However, no boom may be constructed in any navigable stream. Each boom corporation shall have exclusive control over the use and flow of the waters within two miles above and below its principal boom. Each corporation may do whatever is necessary for getting logs to, down, and from the river on which its boom is located. Any person willfully or maliciously destroying or defacing any boom or boomed timber shall be guilty of a misdeameanor and liable for treble damages in an action by the corporation. Similarly, if any logs become lodged on improved lands while sustained, but removal, destruction, or conversion of such timber by the landowner shall be a punishable misdemeanor. No log owner shall unreasonably delay driving such loop into a boom so as to obstruct the use of the stream for others. However, once within a boom, the corporation is liable for all damages except sinking, floods, and fire provided the log owner has filed a memorandum with the clerk of the county court describing the marks and brands used to identify his timber. (Moorhouse-Florida)
W77-08157

RESERVOIRS,
Wyo Stat Ann secs 41-26 thru 41-46 (1959), as amended, (Supp 1971).

Descriptors: *Wyoming, *Beneficial use, *Permits, Legislation, Unappropriated water, Water storage, Ditches, Reservoirs, Water rights, Irrigation, Streams, Diversion, Alteration of flow, Irrigation practices, Obstruction to flow, Reasonable use, Water utilization, Relative rights, Industrial production, Municipal water, Conveyance structure, Administration, Water law, Institutions, State governments, Administrative agencies.

Any person, corporation, association or organization intending to store or impouund for beneficial use, any unappropriated waters of Wyoming shall apply to the state engineer for a permit to construct a reservoir. Secondary permits are granted for the appropriation of stored water for the irrigation of any lands. However, such stored water may be discharged into the natural flow of streams in situations where the natural stream waters have been appropriated or obstructed in such a manner that the waters are insufficient to irrigate the land. The natural stream flow can then be diverted in an amount equal to the stored water for irrigation of the land. Under the 1971 Amendments, water may be diverted for industrial and municipal puurposes as well. However, applications for permits to divert the stream water must be filed in the form of secondary permits, and maps, and other information must show the ditches. The 1971 Amendments require that the accompanying maps show other means of conveyance through which the natural flow of the stream is to be conveyed, the lands to be irrigated or the place of the industrial or municipal use, and the point at which the stored water will be discharged into the stream. (Hadoulias-Florida)
W77-08158

WINKLE V MITERA (RIPARIAN RIGHTS OF AN ISLAND OWNER),
241 NW2d 329-34 (Neb 1976). 1 map.

Descriptors: *Judicial decisions, *Land subsidence, *Nebraska, Rivers, Legislation, Legal aspects, Law enforcement, Legal review, Water law, Submergence, Subsidence, Ownership of beds, Boundaries(Property), Islands, Adverse possession, Accretion(Legal aspects), Navigable rivers, Riparian rights, Navigable waters, Adverse possession.

The defendants appealed the decision of the District Court, quieting title in favor of the plaintiff to a portion of land adjoining the island in question, which had been submerged at one time, but was now reappearing. The Supreme Court of Nebraska noted that under Nebraska law once land has eroded, original title is obliterated. Nebraska law also dictates that ownership of an island includes all the land from the island to the center of the river channel. Consequently, when the disputed land finally reemerged, ownership vested in the plaintiff's predecessor in title, as owner of the island. The court refused to recognize the defendant's claim to title from the tax foreclosure sale, since no notice of the sale was given to the plaintiff's predecessor. The court also refused to recognize title by adverse possession, because the defendants failed to claim open and exclusive possession. The Supreme Court therefore affirmed the District Court's judgement in favor of the plaintiff. (Hadoulias-Florida)

COASTAL ZONE LEGISLATION: LOUISIANA LANDMARKS, LABYRINTHS AND LOGROLLING,
Louisiana State Univ., Baton Rouge. Center for Wetland Resources.
J. R. Van Lopik.
In: The Present and Future of Coasts: Proceedings of the First Annual Conference, November 1975, Arlington, Virginia, Hayden B.P., ed., The Coastal Society, Bethesda, Maryland, p. 37-48. 5 ref.

Descriptors: *Louisiana, *Legislation, *Wetlands, *Management, Regulation, Coordination, Governments, Administrative agencies, Marshes, Coastal marshes, Salt marshes, Tidal marshes, Bayous, Ecosystems, Petroleum, Estuaries, *Estuarine environment.
Identifiers: Coastal zones, *Coastal zone management, *Coastal Zone Management Act of 1972, Marshlands, Estuarine ecology, Marine resources.

More coastal marshlands are found along the coastline of Louisiana than along the entire eastern seaboard of the United States. In 1971 the governor established an advisory commission to investigate the problem of coastal zone management, which at that time was fragmented among twenty-six state agencies in addition to the Corps of Engineers. This commission returned 40 recommendations which form the foundation of work being done on a coastal zone management bill under the federal Coastal Zone Management Act of 1972. Whether the bill is to be passed by the state legislature will require compromise between environmentalists, who want considerable detail as to decision-making guidelines, and legislators, who believe that inordinate detail will preclude any chance of passage. The problems to be considered in formulating a management plan include: the complexity of the problems of ecosystem function, multiple use considerations, and institutional arrangements; economic impacts and management costs; and coordination and control problems among the local, state, and federal agencies. The major areas of concern are the need for additional knowledge regarding the coastal zone, and for increased communication of the knowledge possessed by state agencies and by universities. (Sloan-Florida)
W77-08186

FINAL REPORT OF COMMITTEE VII (FINAL RECOMMENDATIONS OF THE INTERNATIONAL CONFERENCE ON WATER LAW AND ADMINISTRATION),
In: Proceedings of the International Conference on Water Law and Administration, International Association for Water Law, February 8-14, 1976, Caracas, Venezuela; Published by the Commission for the National Water Resources Development Plan (COPLANRH), Caracas, Venezuela, 1976. 14 p.

Descriptors: *International law, *Water users, *Water resources development, *Water management(Applied), International waters, Water utilization, Water supply, Water sources, Water rights, Water resources, Water policy, Water law, Water control, Water allocation(Policy), Education, Research and development, Research priorities, Basins, Governments, Legislation, Law of the Sea, Compensation, Groundwater basins, Groundwater resources, Groundwater.
Identifiers: Expropriation.

The committee report includes recommendations at two levels--national and international. In its recommendations at the national level it suggests nine principles for governments to consider regarding ownership, use, and protection of water resources. The committee also recommends principles in connection with institutional aspects and research. Guidelines concerning water policy, groundwater resources and planning are also discussed. Various legal and institutional criteria aimed at providing effective instruments for water management are listed. Among these criteria is the recommendation that compensation for acquired water rights not necessarily be paid since a change in the legal regime of water resources does not constitute a case of expropriation. The committee recommends government action in the legal regulation of water and the human environment, as well as in education, research and training in water law and administration. At the international level suggested actions include assistance to developing countries with respect to the utilization of water resources, systematized international water resource rules, and principles to be used when basins are internationally shared. (Rieck-Florida)

NEW WATER LEGISLATION--DRAFTING FOR DEVELOPMENT, EFFICIENT ALLOCATION AND ENVIRONMENTAL PROTECTION,
Wyoming Univ., Laramie. Coll. of Law.
F. J. Trelease.
In: Proceedings of the International Conference on Global Water Law Systems, International Association for Water Law, September 1-9, 1975, Valencia Spain; published by Colorado State University, Ft. Collins, Colo. 80523, p 1154-1184, 1976. 31 p, 49 ref.

Descriptors: *Legislation, *Water policy, *Water rights, Water law, Permits, Administration, Planning, Research, Water pollution, Water resources, Water shortage, Water supply, Legal aspects, Regulation, Institutions, Water management(Applied), Priorities, Preferences(Water rights).
Identifiers: *Comparative law, *Phillipines, *Swaziland.

New water laws must be drafted to meet the needs of a rapidly changing world. These new laws must be designed not only to facilitate efficient allocation of resources and protection of the environment, but must also consider social and national goals. The scope of this paper is that part of water law which governs the activities of persons who withdraw and use water for beneficial purposes—the law of water rights. Prior to drafting the author of new water laws should consult local officials who are familiar with the problems, constraints and objectives of the particular area. All water laws should define the scope of the law, and the uses and users of the water resources. Common problems which may arise include: implementing preferences and permits; preserving and register-

ing existing rights; allocating priorities; and implementing administrative controls. The author analyzes various methods of allocating water rights including, temporal priority, equal sharing enforced by proportionate reduction, statutory lists of preferences, administrative discretion, and sale or auctions of water. The author concludes that temporal priority is the preferred method because it cultivates security in the ownership of property rights. The author uses a comparison of the systems of controlling water rights in the Philippines and Swaziland to illustrate his conclusion. (Hadoulias-Florida)

UNIVERSITY PUBLIC SERVICE PROGRAMS AS THEY RELATE TO WATER RESOURCES MANAGEMENT IN WISCONSIN,
Wisconsin Univ. Extension, Madison. Inland Lake Demonstration Project.
S. M. Born, M. T. Beatty, and D. A. Yanggen.
August 1972. 10 p, 1 tab, 15 ref.

Descriptors: *Water resources development, *Water management(Applied), *Natural resources, *Planning, *Land use, *Institutions, *Education, *Wisconsin.
Identifiers: *Water Resources Act of 1965, *Inland Lake Demonstration Project, *Shoreline Management Program, Upper Great Lakes Regional Commission.

The historical and current role of the University of Wisconsin in public policy dealing with water resource management is analyzed. The University has helped shape and define the mission of restructured state agencies, aided general acceptance of planned comprehensive approaches to solving natural resource problems, educated constituents regarding new programs, and, through administrative and legislative efforts, increased the number of environmentally oriented programs by local government. The University should be the research and education arm of government and its policies. The role the University and its Extension Division can play in water related public policy is described in regard to the Water Resources Act of 1965. Within the Act, the University became heavily involved in the educational effort to inform the public of the Shoreline Management Program. Also shown is how applied research is integrally tied to demonstration projects in the analysis of the University's role in the Inland Lake Demonstration Project sponsored by the Upper Great Lakes Regional Commission. Detailed descriptions of current University programs in the water resource area are given, including University Extension, County Extension programs, Public information and public policy programs, University involvement in regional planning for water resources management, and specific University organizations such as the Water Resources Center, the Institute for Environmental Studies, Water Resources Management Program, and various inter-departmental involvement. (Gentry-NC)

IMPROVING INSTITUTIONAL ARRANGEMENTS FOR WATER DEVELOPMENT IN THE STATE OF WASHINGTON: DEVELOPMENTAL AND ENVIRONMENTAL TRADE-OFFS AND CONSTRAINTS,
Washington Univ., Seattle. Inst. of Governmental Research.
R. H. Pealy.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-267 919, Price codes: A09 in paper copy, A01 in microfiche. Completion Report, June 1976, 177 p. OWRT A-057-WASH(1), 14-31-0001-3848.

Descriptors: *Institutions, *Water resource development, *Washington, *Institutional constraints, Organizations, State governments, Networks, Environment, Decision making.

The networks of institutional arrangements in this study consist of federal, state, local, and regional organizations, including the processes they use in planning and developing the functions of irrigation, water supply, electricity generation, navigation, flood control, soil conservation, forest conservation, fish and wildlife conservation and outdoor recreation. The networks are also expected to trade off the values of water development with the values of environmental protection and growth. Each of the networks was originally designed to reach certain objectives: comprehensive, multipurpose, long-range planning and development of river basins; economic efficiency; engineering or technical efficiency; administrative efficiency; and political consensus. The objective of environmental protection was recently added, and, to a limited degree, growth control. The networks have achieved only a moderate degree of success in achieving the objectives. The decision-makers have been using a fragmented model which has made it difficult to set priorities, and to establish the consequences of actions and the decision-making by many groups. It would not be politically feasible, because of certain ideological barriers in the setting in which the networks operate, to use a centralized model for future network design purposes. Rather the principles of the non-structural solution, project smallness and decentralization are likely to be acceptable and effective. Some new organizational structures are suggested, however.

WATER SUPPLY AND CONTROL DEVELOPMENTS SUMMARIZED, (ARIZONA).
From the State Capitals, (Bethune Jones, Asbury Park, N.J.), Water Supply Report No. 6, p 1-2, June 1, 1977.

Descriptors: *Water law, *Water allocation(Policy), Groundwater, Water management(Applied), *Arizona, *Legislation.
Identifiers: *Groundwater law, *Groundwater legislation.

A plan to solve immediate probles with ground water transfer and to set up a commission to develop a state water management plan was recently announced by Arizona state legislative leaders. The bill is designed to meet immediate needs but sets up a process for more comprehensive water management for the state in the future. If approved, existing ground water pumping operations in critical areas would be allowed to continue with a certificate of exemption from the State Land Department. A recent state Supreme Court ruling prohibited the pumping of groundwater from one parcel to another, thereby threatening several Tucson area mining operations and necessitating a change in Arizona's groundwater law. The bill sets up a 23-member commission to devise a water management plan in a two-year time period. (Eberle-NWWA)

EPA FOCUSES ON MUNICIPAL ENFORCEMENT,
P. S. Ward.
Journal Water Pollution Control Federation, Vol 48, No 9, p 2114-16, September 1976.

Descriptors: *Municipal wastes, *Administrative agencies, *Environmental control, *Water permits, *Sanitary engineering, Waste disposal, Legal aspects, Permits, Water law, Environmental engineering, Environment, Waste water disposal, Waste water treatment, Wastes, Sewage treatment, Control, Regulation, State governments, Federal government, Sewage, Municipal water, Water quality.
Identifiers: *Administrative regulations, *Permit compliance process, *Municipal enforcement.

The Environmental Protection Agency's (EPA) Water Enforcement and Water Program Operations Offices have presented a draft report on the municipal enforcement at EPA. The report, analyzing the interaction between and EPA and state municipal waste facilities programs, advocates an immediate strenthening of the agency's management control over the municipal compliance process. Among the report's major recommendations made in response to the discovered ineffectiveness of the compliance process are: to dramatically increase the rate of EPA and state response to identified violations; to improve tracking procedures and documentation of response and follow-up activity; to make compliance schedules more closely related to the construction grant process; and to clarify EPA priorities with respect to the resolution of operational problems. At EPA request, the Committee of Ten (an advisory group to EPA) had its subcommittee also present its own reort on municipal enforcement. The report focuses on regulatory reponse to permit noncompliance and advocates a regulatory policy that is neither so severe as to encourage a detrimental backlash nor so lax as to be ineffectual. This report goes beyond the EPA report is stressing the need for extensive integration of many programs that will in the long run influence municipal compliance. (Anderson-Florida)

COASTAL ENERGY IMPACT PROGRAM.
National Oceanic and Atmospheric Administrations, Washington, D.C.
Federal Register, Vol 42, No 3, p 1164-87, January 5, 1977.

Descriptors: *Coastal structures, *Coastal engineering, *Energy, *Management, Administrative agencies, Federal government, State government, Local governments, Economic impact, Regulations, Control, Planning, Comprehensive planning, Long-term planning, Area redevelopment, Estimated costs, Financial feasibility, Regional development.
Identifiers: *Coastal Zone Management Act of 1972, Coastal zones, Coastal energy impact fund, Coastal Energy Impact Program, Outer Continental Shelf, Coastal energy activity, Coastal waters, Administrative regulations.

The National Oceanic and Atmospheric Administration has established interim-final regulations defining the procedures by which coastal states and local governments can qualify for impact assistance under the Coastal Energy Impact Program. The program is aimed at meeting state and local needs resulting from coastal energy activity and Outer Continental Shelf (OCS) energy activity. To be eligible for assistance, a coastal state must be receiving a grant under section 305 of the Coastal Zone Management Act, must have an approved coastal zone management plan under section 306 of the Act, or must be making satisfactory progress toward the development of a management program. Each year a list of coastal energy activities is compiled which forms the basis for allotments among the coastal states. Calculations are then made regarding the increased employment and population likely to result from construction or expansion of the energy facilities on the list. Such calculations will produce a 'need factor' for the various states. Allotments will then be made to the states who will have responsibility for distribution among their local governmental units. Identifiers: *Navigability tests, *Public trust doctrine, *Water rights(Non-riparians), *Navigational servitude.

The issues of public rights in, and use of, the waters within Pennsylvania are important to the economic, social and environmental development of the state. The origins of public rights in surface waters stem from English law and early federal jurisdiction over navigable water ways. Waters which are navigable in fact are declared public rather than private. A review of both federal and state standards reveals a wide variation as to what constitutes navigable waters, and ultimately to what are private or public, waters. In Pennsylvania, the beds of navigable rivers and lakes are held in trust for the public. The public, therefore, has a right of unencumbered use of these waters. Between the high and low water marks, the public has a right of servitude or easement. The conflict regarding the use of Pennsylvania's private but navigable lakes has not yet been resolved. Pennsylvania approaches public rights to lakes and streams on an ad hoc basis leaving behind the rubric of navigability. Definitive statement of the public's right in surface waters awaits judicial resolution or legislative action. (Morse-Florida)

REMEMBERING MAINE: OFFSHORE FEDERALISM IN THE UNITED STATES AND CANADA,
Toronto Univ. (Ontario). Faculty of Law.
G. S. Swan.
California Western International Law Journal, Vol 6, No 2, p 296-322 (1976).

Descriptors: *Federal jurisdiction, *Oceans, *International waters, *Federal-sstate water rights conflicts, Federal government, Judicial decisions, State jurisdiction, Water rights, Jurisdiction, Legal aspects, Governmental interrelations, Political aspects, Coordination, Continental shelf, Proprietary power, Regions, *United States, *Canada, Australia.
Identifiers: *Seabeds.

The danger of international rivalries over marginal sea area exploitation renders persuasive an energetic federal government role in the marginal sea area. There continues to be a state-federal/provincial-federal issue concerning rights connected to marginal seabeds in both the United States and Canada. The United States Supreme Court has held that national external sovereignty is the critical factor in deciding controversies over seabeds in favor of the federal government. The court stated that federal authority over marginal seabeds hinges on the federal defense/foreign relations capacity, with national rights being paramount. The Canadian Supreme Court's decisions resemble the opinions of the United States Supreme Court in empowering the Dominion Parliament to impose laws having extra-territorial operation. Possible future jurisdictional problems in Canada may be resolved through the use of politicolegal strategies relied upon in both Australia and the United States. The underlying concept of these strategies is one of cooperation between the states and the federal government to establish a single administrative regime rather than to divide the territorial seabed into areas. (Rieck-Florida)

STATES' RIGHTS IN THE OUTER CONTINENTAL SHELF DENIED BY THE UNITED STATES SUPREME COURT,
A. W. Anderson.
University of Miami (Florida) Law Review, Vol 30, No 1, p 203-15 (1975).

Descriptors: *Submerged lands, *Maine, *United States, *Continental shelf, *Federal-state water rights conflicts, Legal aspects, Legal review, Federal government, Boundary disputes, Judicial decisions, Federal jurisdiction, State jurisdiction, Ownership of beds, Water law, Governmental interrelations, Governments, Legislation, Submerged Lands Act.
Identifiers: Territorial sea(Jurisdiction), Coastal waters, *Outer continental shelf.

In response to Maine's issuance of a permit for oil and gas exploration of the outer continental shelf off its coast, the United States sought a declaration that Maine and 12 other states had no rights in the shelf. The U. S. Supreme Court agreed that national sovereignty required exclusive national ownership of the seabed and subsoil from the 3 mile territorial sea to the outer continental shelf. Other states had claimed state ownership of submerged lands on the basis of sovereignty and the exercise of dominion prior to admission to the United States. Those claims were defeated, but Congress, in response, quit claimed the 3 mile territorial sea to the states. Maine asserted the same historical claim to ownership in the instant case. The Supreme Court, rejecting the argument that Congress had abrogated the federal paramount rights doctrine in quit claiming the territorial sea relied on the necessity of exclusive national sovereignty. The court thus confuses dominion over mineral resources and property rights with sovereignty in the international arena. Congress has properly recognized that the right to conduct foreign affairs does not require exclusive federal control over the domestic allocation of benefits and burdens of submerged lands. THE ENVIRONMENTAL PROBLEM OF THE OCEANS: AN INTERNATIONAL STEPCHILD OF NATIONAL EGOTISM,
N. E. Abrams.
Environmental Affairs, Vol 5, No 1, p 3-32 (Winter 1976).

Descriptors: *United Nations, *Environmental effects, *International commissions, *Oceans, *Political aspects, *Political constraints, International waters, International law, Regulation, United States, Water, Water rights, Economic impact, Economics, Economic justification, Competition, Governments, Governmental interrelations.
Identifiers: *Law of the sea, *Law of the Sea Conference.

Protection of the ecological balance of the world's oceans is difficult to accomplish since international agreements regarding the seas are primarily concerned with defining political and economic rights of the participating nations. The author attempts to show that international conventions are generally inadequate, and more importantly, that the practice of treating environmental responsibility for the oceans according to traditional notions of state sovereignty is a serious error. Focusing on the 1975 United Nations Law of the Sea Conference as the most comprehensive attempt to date to codify the rights and obligations of individual states with respect to the sea and to each other's maritime interests, the author demonstrates the devastating effects of regional politics and the lack of international sensitivity. The author suggests that the problems of preservation of the marine environment be treated separately from the problems of re-writing the law of the sea for maximum achievement of ecological goals. AQUACULTURE: PROBLEMS OF IMPLEMENTATION UNDER EXISTING LAW,
British Columbia Univ., Vancouver. Faculty of Law.
R. C. McCutcheon.
University of British Columbia Law Review, Vol 10, p 289-319 (1976). 139 ref.

Descriptors: *Aquiculture, *Navigable waters, *Riparian rights, *Commerical fishing, International law, Governments, Economic impact, Legal aspects, Water rights, Ownership of beds, Water law, Canada, Flow, Fisheries, International waters, Non-navigable waters, Stream-beds, Tidal waters, Pipelines, *Canada.
Identifiers: *British Columbia, Coastal waters.

The oceanographic and topographical characteristics of the British Columbian coastline make it a prime area for aquaculture. However, entrepreneurs are forwarned of inherent problems. Aquaculture facilities are by necessity constructed in navigable waters and pose harmful obstacles to navigators and possible liability to aquaculturists. Adequate warning systems are imperative. Facilities built upon non-tidal waters may conflict with reparian rights. The aquaculturist would probably be required to compensate the riparian owner or obtain a lease from him. Additionally aquaculture may conflict with fishing. In non-tidal areas, water lot leases would be required but in tidal waters the government possesses the power to control fishing. The aquaculturist would be left the task of convincing the government of the true public value of his activities. The construction of aquaculture facilities would restrict other possible uses of public waters. Once again the aquaculturist would be forced to prove his endeavors are worth the cost. A final problem to be faced by the aquaculturist is the damage that could be done to his stock by the construction of submarine pipelines and cables in his underwater area. (Moorhouse-Florida)

SHOULD RIVERS HAVE RUNNING. TOWARD EXTENSION OF THE RESERVED RIGHTS DOCTRINE TO INCLUDE MINIMUM STREAM FLOWS,
Idaho Water Resource Board, Boise.
S. W. Reed.
Idaho Law Review, Vol 12, No 2, p 153-67 (1976).

Descriptors: *Idaho, *Reservation doctrine, *Appropriation, *Beneficial use, Legal aspects, Prior appropriation, Water law, Water rights, Diversion, Unappropriated water, Federal reservations, Aquatic lide, Aquatic animals, Fish, Aquatic plants, Ecosystems, Biological communities, Rivers, Streams, Aquatic environment, Indian reservations.
Identifiers: *Standing(Legal), Reserved rights doctrine, Indian water theory.

Following the notion of standing for natural objects, standing for rivers and the natural creatures living in them is advocated herein. Western water law (prior appropriation of water for beneficial use determines right) is compared with Indian concepts of water rights. The Indians did not believe in ownership of water because it was an integral part of the ecosystem in which all forms of life had equal rights. Recently the Idaho legislature recognized non-economic uses of streams when it provided for recreation uses. The recognition was, however, still phrased in terms of human benefit. Protection of life dependent on stream flow is the true issue, since pollution and diversion destroy aquatic life not people. The reserved rights doctrine may provide the medium for legal recognition of these rights. It maintains that all federal reservations have a right to use of water from included and adjacent streams and rivers to make those reservations productive. Prior appropriation for beneficial use need not be shown. Similarly, the rights of animate and inanimate objects to an adequate instream flow of water should be implied from the ecosystem itself without need for economic justification. (Moorhouse-Florida)

Identifiers: *Western United States, *Winters doctrine, *Aboriginal water rights, *Indian water rights.

Various historical factors resulted in three different approaches to water law in the evolution of legal systems in the Western states, as opposed to the uniform adherence to the English common law doctrine of riparian rights in the East. Because the Western states each created and enforced their own systems, a pattern of reliance on state law developed, and the role of federal law was ignored for many years. In 1908, however, the Supreme Court held in Winters v. U. S. that there is a right in the federal sovereign to reserve water on Indian reservations. This principle, known as the Winters doctrine, was affirmed in subsequent decisions and eventually expanded to uphold claims asserted by the United States to waters on other federal lands. As the doctrine has developed judicially, with no statute dealing directly with the subject, the states have opposed its development in many areas. The result has been confusion, conflict, and controversy between federal and state interests and disagreement among legal scholars. The author suggests an administrative scheme which bring all users of the water in contested areas into a single forum having jurisdiction over the water and the parties. (Sloan-Florida)

WATER FOR FOOD - OR FOR MORE IMPORTANT PURPOSES. (REALLOCATION OF IRRIGATION WATER TO CITIES AND INDUSTRIES),
Wyoming Univ., Laramie. Coll. of Law.
F. J. Trelease.
In: Proceedings of the International Conference on Water Law and Administration, International Association for Water Law, February 8-14, 1976, Caracas, Venezuela; Published by the Commission for the National Water Resources Development Plan (COPLANARH), Caracas, Venezuela, Vol. 15, 1976. 22 p, 21 ref.

Descriptors: *Irrigation effects, *Water utilization, *Preferences(Water rights), *Irrigation water, *Water allocation(Policy), Appropriation, Food abundance, Water law, Foods, Productivity, Cost allocation, Environmental effects, Social aspects, Beneficial use, Water distribution(Applied), Water management(Applied), Legislation, Agriculture, Industrial water, International law, Cost repayment, Compensation.

Irrigation water, which had previously been allocated for agricultural uses, is presently being reallocated to supply city and industrial water needs. Although the reallocations are 'logical and necessary', the author suggests that the reallocations should be reconsidered because they cause economic dislocations and food crises. The author discusses and analyzes various state, national and international laws which govern reallocations and preferential use of water. The indirect effects of these laws include: (1) declining food production; (2) forced transfers which generate insecurity in farmers; (3) great social costs, such as displaced agricultural workers and disruptions in rural life and values; and (4) failure to consider all alternative solutions. The author concluded that the use and reallocation of water should be practical and functional. The correct approach is to weigh all the social and economic costs and benefits, and to insure that all losses to harmed parties include full compensation. Finally, the crucial question should be whether the particular transfer is the best solution to that problem. (Hadoulias-Florida)

EMERGING LEGAL CONCEPTS IN THE HARMONIZATION OF WATER RESOURCES DEVELOPMENT AND ENVIRONMENTAL PROTECTION,
Fordham Univ., N.Y. School of Law.
L. A. Teclaff.
In: Proceedings of the International Conference on Water Law and Administration, International Association for Water Law, February 8-14, 1976, Caracas, Venezuela; Published by the Commission for the National Water Resources Development Plan (COPLANARH), Caracas, Venezuela, p. 1023-1046, 1976. 52 ref.

Descriptors: *United Nations, *Environmental effects, *International commissions, *Environmental control, Foreign countries, Governments, Governmental interrelations, Legal aspects, Federal government, Administrative agencies, Regulation, Social aspects, Standards, Water policy, Administration, Project planning, Benefits, Cost allocation, Cost-benefit analysis, Resources.

Identifiers: *National Environmental Policy Act, *Stockholm Conference of the Human Environment, *United Nations Environment Programme, Administrative regulations, Environmental impact statement.

Recently environmental protection has moved from a conflict between development and conservation to active protection of environmental concerns by ensuring their adequate representation in development considerations. In the United States this theory is evidenced by the impact statement called for by the National Environmental Policy Act of 1969. Such statements must be filed by federal agencies before the initiation of any project which significantly affects the environment. The statement is a detailed examination of any impact on the environment, as well as any irreversible commitments to resources. The purpose is to allow more informed decision-making. The Council on Environmental Quality has developed guidelines for agencies to use which ensure that environmental considerations get due weight. The weakness of the process lies in the area of review. Agencies are generally left on their own in deciding whether the project should proceed. Court review is possible, but on an ad hoc basis only. The United Nations has recognized that one nation's development can seriously affect the ecology of a fellow nation and proposed a similar system. Nations should report proposed development to other nations with an analysis of environmental impact and resource commitment. The United Nations Environment Programme has been developed to issue guidelines. As in the United States, compliance is conditioned on good faith as no true final arbiter can be established. REPORT ON WATER RESOURCES PROBLEMS OF WESTERN COLLIER COUNTY, FLORIDA AS AFFECTED BY THE GAC CORPORATION'S CANAL SYSTEM IN ITS GOLDEN GATE DEVELOPMENT PROJECT,
Florida Univ., Gainesville. Coll. of Law.
F. E. Maloney.
Available from Eastern Water Law Center, University of Florida, Gainesville, Florida 32611. Price $1.40. In: Phase 1 Golden Gate Estates Redevelopment Study Collier Co., Florida, p M-1 to M-28 (June 1975).

Descriptors: *Florida, *Flood control, *Saline water intrusion, *Legal aspects, Surface drainage, Comprehensive planning, Zoning, Canals, Eminent domain, Local governments, Non-structural alternatives, Wildlife conservation, Waste water disposal, Planning, Water zoning, Constitutional law, Coastal marshes, Groundwater, State governments.
Identifiers: *Coastal waters, Citizen suits, Administrative regulations.

The land and water management of western Collier County in its present form will be destructive of the environment of nearby bays and forests, in addition to being inadequate for flood control. In order to preserve the ecological integrity of the area re-planning is necessary, including returning to use as wetlands those areas best suited for that purpose. This action would deter harm to the coastal areas of the county, and would alleviate the substantial danger of salt water intrusion inland. Such action would, however, return a substantial portion of the Golden Gates Estates area to a non-developable condition, and the resulting rise in ground water level would impair the developers' contracts for sewage facilities. Nevertheless, the regulation would be a reasonable approach to a legitimate end. Moreover, alternative waste disposal methods are available. Sufficient public purpose exists to use eminent domain to acquire the land needed for return to its natural state, both in flood-prevention and protection of fish and wildlife. Methods of implementation for the stated goals are discussed, for example, state, county, and federal regulations, and citizens' suits in the federal courts. (Molloy-Florida)

RESTLESS RIVER: INTERNATIONAL LAW AND THE BEHAVIOR OF THE RIO GRANDE,
Texas Univ. at Austin. Dept. of Geography.
J. E. Mueller.
Texas Western Press, El Paso, 1975. 155 p, 13 map, 9 photo, 15 tab. $5.00.

Descriptors: *Boundaries(Property), *Mexico, *Rio Grande River, *International Boundary and Water Commission, Federal government, Rivers, Running waters, International Joint Commission, International law, Legal aspects, International waters, Treaties, Accretion(Legal aspects), Avulsion, Boundary disputes, Bank erosion, Banks, Fluvial sediments, Meanders, River flow, Estuaries.
Identifiers: Dam effects, Reliction.

The history of the Rio Grande as the international boundary between Mexico and the United States is divided into five distinct segments. The first era, the pre-boundary stage existed while Colonial powers rearranged their North American holdings. It alerted Mexico to the need for a Northern Boundary. The second era lasted from 1848 to 1884 and was characterized by a fixed line boundary between the two countries. Era three, lasting from 1884 to 1905 utilized the Rio Grande as the exclusive boundary. This proved totally unsatisfactory as the scant vegetation and low clay content alonf the banks provided little resistance to highly variable water discharges. The result was a highly erratic and wandering river leading to untold boundary disputes. The fourth era lasted from 1905 to 1970 and was known as the mildly-variable line era since large dams built along the river tamed its flow. The last era arises from a 1970 treaty. Severe restrictions on water discharge and an agreement to restore a channel to its boundary course after a shift, guarantees that the river as a boundary will become fixed in succeeding decades. Identifiers: *Federal Water Pollution Control Act Amendments of 1972(Amendments of 1972), *American Frozen Food Institute, *Potato Processors of Idaho, Pollution control guidelines, Effluent limitations, Administrative regulations, Congressional hearings on Water Pollution Control Act of 1972.

Petitioners-representatives of the potato processing industry sought a review of an order of the Environmental Protection Agency (EPA) with respect to the issuance of guidelines and effluent limitations for the industry. Petitioners alleged that the Administrator of the EPA had violated the Federal Water Pollution Control Act (FWPCA) Amendments of 1972, and abused his discretion. The court ruled that it had jurisdiction of the case, and that the Administrator's interpretations were valid. It was ruled permissible for the Administrator to establish guidelines and effluent limitations on the same day and in the same document provided advance notice of the proposed action was given to the industry. In this case it was. The Administrator was not required to set guidelines and limitations for individual point sources of pollutant discharges, but rather was permitted to establish them by categories and sub-categories of industry. The Administrator was permitted to use two Canadian plants as 'exemplary plants' for establishing guidelines and limitations provided that the technology used there was also available to industries in this country. The Administrator's addition of fecal coli to the list of controlled pollutants without notice to the industry was held violative of the Administrative Procedures Act; that single point was remanded for further consideration. LIABILITY FOR DAMAGES TO ADJACENT LAND OR BUILDING CAUSED BY DREDGING,
D. Ytreberg.
62 ALR 3d 526-34 (1975).

Descriptors: *Dredging, *Damages, *Negligence, *Adjacent landowners, Legal aspects, Legal review, Water law, Accidents, Hazards, Risks, Common law, Permits, Public rights, State governments, Riparian land, Governments, Social aspects, Judicial decisions.
Identifiers: *Strict liability, *Absolute liability, Liability, Ultra hazardous activity, Inherently dangerous activity.

In response to damages resulting from dredging operations, land owners have sought recovery on several legal theories, including the common-law right to lateral support from adjacent property, ex-

traordinarily risky operations imposing strict liability and simple negligence. Courts have deemed the common-law right to lateral support from adjacent property inapplicable to adjacent lands underwater. Courts have based their refusal to apply such a doctrine on the fact that the underwater land is in the ownership of the state holding it in trust for the people. Anyone who dredges in relation to such land does so by statutory authorization, and thus there is no liability for any resulting damages. Only one court has held that dredging is an inherently dangerous or extraordinarily risky activity. This theory will probably remain closed to litigants. The most common theory of recovery for dredging damage has been simple negligence. In such an action the plaintiff must prove both that the dredging proximately caused his damage, and that the dredger breached the standard of care common to all dredgers in the community. Plaintiffs have been successful in approximately half the cases. (Moorhouse-Florida)

RUSSO V. NEW YORK DEPT. OF ENVIRONMENTAL CONSERVATION (LIMITS OF STATE REGULATIONS RESTRICTING ALTERATION OF WETLANDS).
391 NYS2d 11-12 (Sup. Ct. 1977).

Descriptors: *New York, *Wetlands, *Eminent domain, *Conservation, Salt marshes, Tidal marshes, Preservation protection, Real property, Property values, Constitutional law, Legislation, Water law, Legal aspects, State governments, State jurisdiction.
Identifiers: *New York Tidal Wetlands Act.

When New York's Tidal Wetlands Act went into effect in 1973, it placed a moratorium against alteration wetlands. Plaintiff was co-owner of real property in a tidal salt marsh which was affected by the moratorium. He applied to the State Department of Environmental Conservation for a permit to construct a one-family home and it was denied. Plaintiff alleged in this appeal from the denial that the act as applied deprived him of all reasonable use and enjoyment of his property so as to constitute a taking of it without compensation. The court held that while the State has the power to temporarily restrict the use of land, the duration cannot be unreasonable; and where there is no indication as to when the moratorium will end, the constitutionality of its provisions is subject to renewed inquiry. (Jones-Florida)
W77-08388

HIBISCUS HARBOR, INC. V. STATE (METES AND BOUNDS DESCRIPTION FAVORED OVER LOW WATER MARK IN DETERMINING OUTCOME OF BOUNDARY DISPUTE).
391 NYS2d 510-13 (Sup. Ct. 1977).

Descriptors: *New York, *Boundaries(Property), *Islands, *Boundary disputes, Judicial decisions, Water law, Lakes, Low water mark, Legal aspects, Maps, Surveys, Water levels, Mapping, Water level fluctuations, Water table, Measurement, State governments, Real property.
Identifiers: Property, *Property interests, *Metes and bounds.

Plaintiff, the purported property owner, brought action to determine title to island property. Defendants include owners of cottages on the disputed tract who claim title by adverse possession, and the state. Plaintiff contended that it had title to the island based on two Letters Patent, which are fully described in metes and bounds and are further supported by field notes describing the parcel with a map. The plaintiff argued that the descriptions could only be interpreted to include title to the island, or in the alternative that its title extended to the low water level of the lake which would be located east of the island, thus encompassing the island. The court held that it was impossible to determine what the level of the lake was at the time of the Letters Patents. Since the natural level of the lake could be varied by man, the court declined to fix a location for the low water line. Instead, by relying on a more recent survey which coincided exactly with the metes and bounds of the Letters Patent the court found that the plaintiff did not own the disputed property. The court declined to decide defendants' claim of adverse possession. (Petruff-Florida)
W77-08389

AUBERT V TOWN OF FRUITA (SENIOR DIRECT FLOW RIGHTS FAVORED IN DISPUTE OVER DAM).
559 P2d 232-35 (Colo Sup Ct 1977).

Descriptors: *Colorado, *Dams, *Flow control, *Prior appropriation, Water rights, Domestic water, Streams, Water law, Reservoir storage, Water control, Control, Flow, Water storage, Reservoirs, Legal aspects, Competing uses, Riparian rights, Judicial decisions.
Identifiers: *Estoppel, *Direct flow rights.

Plaintiff owners sought an injunction directing defendant town to cease violating their senior direct water flow rights. The lower court granted the injunction and the defendant town appealed. The defendant's sole argument on appeal is the alleged err of the trial court in rejecting the defendant's affirmative defenses of estoppel, laches, and waiver. The lower court found that the defendant, utilizing its right to store water for domestic use, built an on-channel reservoir and dam in 1935 and enlarged it in 1959, 1962, and 1967. The enlarged dam blocks the entire flow on the west fork of a creek. The plaintiffs hold direct flow rights downstream on this creek which are senior to defendant's rights. The trial court found that since 1959 the plaintiffs and their predecessors had protested this interference with their direct flow rights. The lower court held that this evidence was sufficient to keep the defendant from asserting estoppel. The state supreme court affirmed and in dicta set out estoppel principles to be used in the context of a water law case. (Petruff-Florida)

BANK OF AMERICA NATIONAL TRUST AND SAVING ASSOCIATION V STATE WATER RESOURCES CONTROL BOARD (CONDITION PLACED ON WATER PERMIT DEFEATED FOR LACK OF EVIDENCE OF NECESSITY).
116 Cal Rptr 770-80 (Ct App 1974).

Descriptors: *California, *Appropriation, *Public access, *Reservoirs, *Diversion, Real property, Recreation, Fishing, Water management(Applied), Municipal water, Irrigation, Water permits, Land development, Competing uses, Water law, Legal aspects, Rivers, Streams.

Appellant was a corporate trustee of land being developed for a labor union training center. It filed several applications with respondent water board for authorization to appropriate water from a river and unnamed streams running through the property. The board granted the applications, attaching, however, a condition that the reservoirs created by the diversions were to be kept open to the public for recreational use. The intention was to compensate the public for diminished recreational value of the river and effects on fishing resulting from the diversions. The court on appeal examined the record for substantial evidence to support the imposition of the condition and found it lacking. The court looked to the fact that the fish and game commission and appellant had agreed upon detailed conditions regulating the amount and periods of diversion to assure fish protection; and it looked to the lack of evidence of impairment of recreational facilities. The condition was ordered deleted and the matter remanded to the board to reconsider its approval of the applications for water appropriation. (Jones-Florida)

ANDERSON V YEAROUS (RIGHTS OF DOMINANT OWNERS TO UNOBSTRUCTED USE OF DRAINAGE EASEMENTS).
249 NW2d 855-65 (Iowa 1977).

Descriptors: *Easements, *Surface runoff, *Iowa, *Flooding, *Ditches, Surface waters, Water rights, Legal aspects, Flow system, Floods, Floodwater, Floodways, Drainage, Drainage water, Drainage systems, Right-of-way, Water conveyances, Levees, Judicial decisions.
Identifiers: *Dominant tracts, *Servient tracts, *Dominant owners, *Servient owners, *Prescriptive rights, Waterflow, Nuisance, Injunction.

Plaintiff owner of dominant tract (land benefitted by adjacent tract) depended on drainage ditch built by his predecessor to carry water runoff across the property of defendant owner of servient tract (land burdened by adjacent tract). Defendants' predecessor dug a trench to carry the water from plaintiff's higher land across defendants' lower land to a nearby river. Thereafter, plaintiff and defendant bought the two adjacent tracts. Defendants erected a levee to stop the water flow from plaintiff's land causing water to back up and flood plaintiff's crops. Plaintiff sued in equity asking for a permanent injunction against defendants to prevent further obstruction of the water flow, and for damage to his crops. The court took notice that the drainage ditch had been in use for 30 years before defendants' erected their levee. At the time defendants bought their tract, they had notice of plaintiff's easement (right-of-way). The court held that plaintiff had a prescriptive easement (legal right resulting from continued use). Also, it held that although the ditch began as an artificial waterway, it had ripened into a natural waterway and therefore defendants' levee unreasonably obstructed a 30 year flowage system and constituted an enjoinable nuisance. (Denker-Florida)
W77-08392

WATER RIGHTS GENERALLY; APPROPRIATION.
Idaho Code Ann secs 42-101 thru -112 (1948), as amended, (Supp 1976).

Descriptors: *Idaho, *Appropriation, *Beneficial use, *Preferences(Water rights), *Water allocation(Policy), Priorities, Prior appropriation, Legal aspects, Water law, Water rights, Administration, Allotments, Water control, Water permits, Water measurement, Water loss, Diversion, Alteration of flow, Water management(Applied), Diversion loss, returns, Irrigation, Irrigation ditches.
Identifiers: *Licenses, *Groundwater management.

All the waters of Idaho when flowing in their natural channels, are the property of the state, and thus under its control. However, the beneficial use of diverted public waters is not considered a property right, but rather an appurtenance to the land--a right which the state may only deny upon the failure to pay ordinary assessments for delivery of the water. The right to the use of unappropriated waters must comply with the license procedure provided for in this title, and must be for some beneficial purpose. The 'first in time is the first in right' doctrine governs priority among appropriators utilizing the waters of running streams, as well as seepage, waste or spring waters. Prior appropriated waters may be diverted into the channel of another stream, and then reclaimed with an allowance for loss by evaporation and seepage. This exchange of water must be approved by the department of water resources and agreed upon by the persons involved in the exchange. Although a change in the point of diversion is permitted, a change in the course of a ditch used for conveying and selling waters for irrigation purposes is prohibited if it interfers with those purposes. AMERICAN PETROLEUM INSTITUTE V ENVIRONMENTAL PROTECTION AGENCY (CHALLENGE TO EPA STANDARDS FOR REFINERIES UNDER THE FWPCA AMENDMENTS OF 1972).
540 F2d 1023-39 (10th Cir 1976).

Descriptors: *Federal government, *Permits, *Industrial production, Water pollution, Administrative agencies, Pollution abatement, Legislation, Regulation, Water pollution sources, Water pollution control, Oil industry, Oil wastes, Judicial decisions, Water policy, Water quality standards, Legal aspects.
Identifiers: *Federal Water Pollution Control Act (FWPCA) Amendments of 1972.

Petitioner refineries and organizations requested review of Environmental Protection Agency (EPA) regulations published pursuant to the Federal Water Pollution Control Act (FWPCA) Amendments of 1972. The establishment of effluent limitation was challenged for lack of authority, noncompliance with the act, and on the factual ground that the record does not sustain the action of the EPA. Since the statute demands preventive action, and factual certainty regarding future technologies is impossible, the court considered only whether the record supporting the promulgated standards was adequately adduced and rationally applied. The court observed that permits can be issued by the EPA or a complying state, thus the regulatons were a reasonable exercise of a congressionally delegated power. The general standards were found to be presumptively applicable unless rebutted by a permit applicant. Variances were considered a rule-making prerogative, although there was no statutory provision for variances to the 1977 standard. In reviewing the factual record, the court upheld limitations for existing sources except for stormwater runoff, and upheld new source limitations, but found no reasonable basis for the 1983 existing source limitations. (Molloy-Florida)
W77-08394

APPROPRIATION OF WATER FOR POWER (HYDROELECTRIC POWER PROJECTS).
Ore Rev Stat secs 543.110 thru .320 (1973).

Descriptors: *Hydroelectric power licensing, *Oregon, *Appropriation, *Electric power production, *Permits, Administrative agencies, State governments, Local governments, Bodies of water, Federal government, Electric powerplants, Electric power industry, Social aspects, Management, Water demand, Economic impact, Water allocation(Policy), Water management(Applied), Water supply, Water users, Hydroelectric power, Hydroelectric plants.
Identifiers: Oregon Water Resources Board, Certification, Licenses, Administrative regulations, Oregon statutes.

Oregon has enacted regulations to be followed by those wishing to appropriate water for the production of electricity. Such regulations do not apply to hydroelectric projects constructed by the federal government. All individuals seeking to appropriate water must first submit an application to the State Water Resources Board. All interested parties will be notified of the application and a public hearing will be scheduled. At the hearing the board will rule upon the appropriateness of granting the water use license. Factors considered include the maximum economic development of the water involved, the amount of water available for appropriation, and all other state formulated water resources policies. Licenses issued shall not exceed fifty years in duration. Licensees are expected to follow all regulations established by the State Engineer as well as maintain their projects in good order and repair. The State Engineer is authorized to waive all licensing procedures for projects of less than 100 horsepower. The State Engineer may also grant a preliminary permit for a period not exceeding two years. The terms and conditions of such a preliminary permit are to be established by the State Engineer. The State Engineer may, in his discretion, cancel a permit. (Moorhouse-Florida)
W77-08395

IRRIGATION AND IRRIGATION DISTRICTS.
Kan Stat Ann secs 42-106 thru -358 (1972).

Descriptors: *Kansas, *Irrigation, *Irrigation districts, *Distribution systems, Irrigation operation and maintenance, Irrigation practices, Irrigation systems, Irrigation water, Water rights, State governments, Local governments, Legislation, Water contracts, Irrigation ditches, Embankments, Irrigation canals, Irrigation engineering, Water distribution(Applied), Irrigated land, Eminent domain.
Identifiers: *Kansas irrigation districts, Kansas statutes.

Irrigation districts may be established in Kansas by a petition of three-fourths of the landowners within a proposed district. Such petition is submitted to the board of county commissioners which creates the district. Irrigation districts may utilize existing water channels to supply water or cut new ditches. Right-of-way for new channels can be obtained through the power of eminent domain. Once acquired, the right-of-way remains unless there is a period of non-use for two consecutive years. Irrigation districts as well as other canal companies are charged with keeping their dams, locks and gates, embankments and all other equipment in good order and repair. Such entities are liable for damages resulting from faulty equipment. If purchasers of water from any irrigation company consider the rates for such water to be unreasonable or unjust, complaints may be filed with the state corporation commission. The commission shall hear testimony and determine the validity of the complant. Provisions are also made for the drilling of individual artesian wells and the recording of rights in relation thereto. (Moorhouse-Florida)
W77-08396

ARTESIAN WELLS.
Idaho Code Ann secs 42-1601 thru -1605 (1948).

Descriptors: *Idaho, *Artesian wells, *Well permits, *Well regulations, Water wells, Artesian heads, Public rights, Mechanical control, Mechanical equipment, Water conservation, Water control, Water policy, Water permits, Water storage, Water structure, Water loss, Water management(Applied).
Identifiers: Public nuisance, Nuisance(Legal aspects), Groundwater management.

Artesian wells which are uncapped or which are not equipped with approved devices to control the flow of water from such wells are declared to be a public nuisance in the state of Idaho. However, if the waters of artesian wells are reservoired and controlled so as to prevent waste, the commissioner of reclamation may except such wells from being declared a nuisance. Owners, occupants and possessors of land upon which artesian wells are located may not lawfully permit the continuance of waste or nuisance resulting from such wells. However, domestic users may insert small stop and waste corks in the piping of the wells and use the water taken therefrom for domestic purposes. Persons installing or proposing to install mechaical capping devices on an artesian well must apply to the commissioner for approval of the control device. Artesian wells are defined to include any artificial hole made in the ground through which water naturally flows from subterranean sources to the surface of the ground for any length of time. (Josepher-Florida)
W77-08397

RIPARIAN OWNER'S RIGHT TO NEW LAND CREATED BY RELICTION OR BY ACCRETION INFLUENCED BY ARTIFICIAL CONDITION NOT PRODUCED BY SUCH OWNER.
63 ALR3d 249-303 (1975).

Descriptors: *California, *Riparian rights, *Accretion(Legal aspects), *Artificial use, Legal aspects, Judicial decisions, Riparian land, Water law, Natural flow doctrine, Avulsion, Alteration of flow, Obstruction to flow, Relative rights, Water rights, Bodies of water.
Identifiers: *Reliction.

Cases are herein annotated where the actions of man have served as an artificial catalyst for the natural processes of accretion or reliction. This includes accretion which is a direct result of action of waters, even though the course of such waters has been influenced by some artificial means, but does not include changes wrought by avulsion. The claimant riparian owner must have no direct part in causing the accretion. The primary problem is disagreement as to how and where the accretion occurred so the court generally reconstructs the movements of the water body from the original surveys to the filing of the suit. Cases involving litigation between private parties, and between public entities and private parties, are included. While most jurisdictions support the proposition that alluvial deposits belong to the owner of the land, California courts have awarded the accreted land to the state or its grantees rather than to the upland owner. Consequently, California cases stand apart from the general weight of authority. (Rieck-Florida)
W77-08398

UNITED STATES V 3,727-91 ACRES OF LAND IN PIKE COUNTY, STATE OF MISSOURI (COMPENSATION ALLOWED DRAINAGE DISTRICT FOR CONDEMNED PROPERTY).
416 F Supp 525-29 (E D Mo 1976).

Descriptors: *Missouri, *Condemnation value, *Condemnation, *Drainage districts, Judicial decisions, Water law, Legal aspects, Value, Compensation, Economic impact, Governments, Levee districts, Governmental interrelation, Levees, Ditches, United States, Real property.
Identifiers: Property interests, Condemned property, Nominal damages.

Defendant drainage district, owner of property condemned by the United States, sought compensation for the taking of its lands. The district was the owner of 214 acres of levees and ditches constructed to protect real property in the area from floods. The levees were 53 to 54 years old at the date of taking and in poor condition. Various opinions on the proper market value of the property were presented to the court. The government argued that the District was entitled to only nominal damages on the grounds that the District existed to serve a public function, and since there was no necessity of providing substitute levees and ditches the government had actually relieved the District's maintenance burden. The court agreed, finding this condemnation similar to that of public streets, which absent a showing of need for substitute facilities is non-compensable. The court continued, assuming arguendo the inapplicability of the former theory, to question of proper valuation. Findng none of the testimony sufficiently credible to establish market value, the court used reproduction cost less depreciation as a means of determining compensable value. Based on testimony that the useful life of such levees was 50 years, at the time of taking the levees were fully depreciated and again the District was entitled only to nominal damages. Judgment was entered for $1.00. (Moorhouse-Florida)
W77-08399

STATE V CORPS OF ENGINEERS (COST/BENEFIT ANALYSIS UNDER NEPA AND THE FLOOD CONTROL ACT).
411 F Supp 1261-76 (ND Ala 1976).

Descriptors: *Channels, *Cost-benefit analysis, *Alternative planning, *Environmental effects, *Alabama, State governments, Federal government, Administrative agencies, Flood control, Damages, Creeks, Recreation, Excavations, Construction, Fish, Wildlife, Flood plain zoning, Diversion structures, Insurance, Interest rates, Judicial decisions, Governmental interrelations.
Identifiers: *Environmental impact statement, Injunctive relief, National Environmental Policy Act, Crop insurance, *Tombigbee River Valley Water Management District.

Plaintiff state attorney general sought to enjoin defendant federal agency from continuing a stream channelizaton project. The project was planned to provide flood control for urban areas and agricultural lands along the creek. The plaintiff contends that the defendant's decision to implement the project was arbitrary and capricious because (1) the cost-benefit analysis did not include a consideration of environmental losses such as destruction of recreational activities, and (2) a lack of consideration was given to alternative proposals, such as flood plain zoning, crop insurance, or other flood control structures, which would have minimized environmental harm. The United States District Court for the Northern District of Alabama issued a preliminary injunction. The court held that environmental factors which can be quantified in economic terms must be included in the cost-benefit analysis of an environmental impact statement. The court further held that sufficient consideration of alternatives was required. (Capehart-Florida)

OHIO LIQUID DISPOSAL, INC V DAWE (DEFINING 'WATERS OF THE STATE' WITHIN WATER POLLUTION CONTROL STATUTE).
347 NE2d 541-46 (Ohio Ct App 1975).

Descriptors: *Ohio, *Subsurface waters, *Waste disposal wells, *Well permits, *Liquid wastes, *Judicial decisions, Industrial wastes, Environmental sanitation, Pollutants, Waste disposal, Administrative agencies, Industrial water, Environmental effects, Legislation, Ecology, Water law, Regulation, Water quality control, State jurisdiction, Permits, Legal aspects, Well regulations.

Plaintiff corporation collects liquid industrial waste by-products. The plaintiff sought a permit from the Chief of the Division of Oil and Gas for the state of Ohio to inject these liquids into an existing stratigraphic well. The Chief initially approved the permit after determining that no unreasonable risks to oil and gas resources would arise from waste contamination. The Water Pollution Board (WPB), in violation of applicable statutes, refused to grant the permit without a prior hearing. The plaintiff appealed the decision to the Common Court of Pleas. The court noted that the Ohio Statutes do not allow injections of industrial wastes into 'waters of the state'. The court determined, however, that the stratigraphic wells were not 'waters of the state', and therefore ordered that the permit be granted. The Court of Appeals affirmed, and ascertained as well, that state supervision was not necessarily terminated because the Chief can still impose such conditions on the permit as may be necessary to protect the environment. The WPB was also estopped from asserting error that the plaintiff, by mandamus, should have forced them to give prior notice before refusing the permit. (Hadoulias-Florida)
W77-08401

INTERSTATE STREAM COMMISSION (CREATION, MEMBERSHIP, GENERAL POWERS).
New Mexico Stat. Ann. secs 75-34-1 thru -3, 75-34-10 thru -12 (1968).

Descriptors: *Water districts, *Irrigation districts, *New Mexico, *Interstate commissions, *Interstate rivers, Water resource development, Equitable apportionment, Governments, State governments, Political aspects, Water policy, Condemnation, Water law, Water conservation, Water control, Water management(Applied), Legislation, Irrigation, State jurisdiction.
Identifiers: New Mexico Interstate Stream Commission.

The New Mexico Interstate Stream Commission consists of nine members, eight appointed by the governor for a term of six years, and the ninth member is the state engineer. Each appointed member shall be a representative of a major irrigation section. The members of the commission shall serve without compensation, but may receive reimbursement for expenses incurred while actually engaged in the performance of their duties. The commission has the power to negotiate compacts with other states for the purpose of settling controversies, or providing for equitable distribution of waters in interstate stream systems. The commission has various investigative and development functions centering around the water systems of the state, interstate or otherwise. The commission may acquire, when deemed proper, by condemnation, purchase or exchange any land, rights, water rights or easements which are necessary for construction or operation of works authorized to be maintained by the commission. The cost of any such construction shall be met with the proceeds of revenue bonds authorized or by a grant from the federal government. The purpose of the statute is to meet a state-wide need for conservation, protection, and development of the water resources. (Welch-Florida)
W77-08402

CITY OF YORK V. PENNSYLVANIA DEPARTMENT OF ENVIRONMENTAL RESOURCES (DELEGATION OF AUTHORITY UNDER THE PENNSYLVANIA WASTE MANAGEMENT ACT).
364 A.2d 978-980 (Pa. Commonwealth 1976).

Descriptors: *Waste disposal, *Governmental interrelations, *Administrative decisions, *Pennsylvania, Sites, Local governments, State governments, Comprehensive planning, Administration, Planning, Judicial decisions, Legislation, Wastes, Management, Municipal wastes, Solid wastes, New York.
Identifiers: Waste disposal sites, *New York City.

Plaintiff city challenged the authority of defendant Department of Environmental Resources to compel implementation of a regional solid waste management plan. Plaintiff and other cities submitted a plan to the defendant Department. The plan called for the creation of a solid waste refuse authority, and the vesting in it of responsibility to purchase and operate waste disposal sites. Subsequently, the plaintiff refused to implement certain portions of the plan which required delegation of powers to the authority. The Department issued orders seeking to compel compliance with the official plan, and plaintiffs contended that defendant Department lacks such authority under the Waste Management Act. Adopting a liberal construction of the Act, designed to curtail health hazards and environmmental pollution by inadequate disposal practices, the court concluded that to leave implementation to the discretion of cities would frustrate the Act's objectives. Provisions were included in the Act for compelling compliance with sections calling for submission of an officially adopted plan. The court found that abandonment of official plans after approval would reduce the Act to an elaborate and expensive charade, rendering fruitless the comprehensive planning contemplated by the legislature. (Molloy-Florida)
W77-08403

WATER RESOURCES COMMISSION V. CONNECTICUT SAND AND STONE CORPORATION (JUDICIAL REVIEW OF ADMINISTRATIVE FACTUAL DETERMINATION).
364 A.2d 208-12 (Conn. 1975).

Descriptors: *Connecticut, *Sands, *Water pollution control, *Administrative decisions, Adjudication procedure, Decision making, Legislation, State governments, Dredging, Excavation, Gravels, Sediments, Pollutants, Pollution abatement, Legal aspects, Water quality, Water quality control.
Identifiers: *Injunctive relief, Evidence.

Plaintiff Water Resources Commission sought injunctions compelling defendant polluter's compliance with orders to abate pollution. The Water Resources Commission is charged with enforcing statutes regulating, controlling and eliminating pollution of the waters of the state. The Commission determined that defendant was causing pollution, and ordered abatement of operations involving sandwashing and the dredging of sand and gravel. Defendant did not request a hearing, which was a prerequisite for judicial review. At trial for injunctions, defendant attempted to introduce factual evidence relating to its pollution and was not permitted to do so. The court held that failure to request an administrative hearing barred further factual determinations. The injunction was found to be mandated by statute and was therefore not dependant on the court's equity powers and rules. The contention that defendant may have stopped pollution was also judged irrelevant since the review was closed to factual determinations. The possibility of recurrence also indicates that the injunctions were proper since defendant's operations were seasonal in nature. (Molloy-Florida)
W77-08404

APPROPRIATION OF WATER.
Cal Water Code Ann secs 1200 thru 1271, 1375 thru 1485 (West 1971), as amended, (Supp 1976).

Descriptors: *California, *Appropriation, *Beneficial use, *Preferences(Water rights), *Priorities, Water law, Legal aspects, Consumptive use, Domestic water, Municipal water, Irrigation water, State governments, Administrative agencies, Permits, Control, Legislation, Regulation, Governments, Social aspects, Reservoir storage, Public benefits.
Identifiers: *Licenses, *Administrative regulations, California Water Plan.

California has statutorily provided that any unappropriated water may be appropriated for some useful or beneficial purpose. An administrative board has been created to issue permits and generally oversee the water appropriation system. Any person may apply for a water appropriation permit provided he supplies the board with information concerning the amount of water desired and the uses to which it will be put. The board will consider and investigate all applications and determine whether a permit should or should not be granted in light of the public interest. The public is determined by reference to the California Water Plan (a long range outlook on water use in the state). An applicant who is rejected may appeal to a court of competent jurisdiction within a specified time. Permits granted remain valid so long as the water appropriated is used for a useful and beneficial purpose. If such water ceases to be used in the required manner for a period of three years, it reverts and is regarded as unappropriated public water. The board retains discretion to extend time periods when necessary. The statute explicitly grants municipalities and other public corporations priority in the acquisition of unappropriated water. (Moorhouse-Florida)
W77-08405

WATER DISTRICTS AND COMMISSIONERS.
Wyo. Stat. Ann. secs. 41-61 thru 41-75 (1959), as amended (Supp. 1971).

Descriptors: *Wyoming, *Water districts, Streams, Reservoirs, *Ditches, Legislation, Administration, *Legal aspects, Regulation, Governments, Institutions, Stream stabilization, Stream erosion, Stream improvement, Streamflow, Reservoir operation, Water control, Water allocation(Policy), Water distribution(Applied), Water management(Applied), State governments, Water policy, Competing uses, Administrative agencies, Administrative decisions, Economic efficiency, Water rights.
Identifiers: Headgates.

The Wyoming Board of Control shall divide the state's stream systems into units called water districts in order to secure the best protection to the claimants for water, and the most economical supervision for the state. A water commissioner shall be appointed to divide, regulate and control the use of the water of all streams within his district, including regulating headgates to prevent waste. The Commissioner has the right to regulate the distribution of water among various users under any partnership or incorporated reservoir, or any partnership or incorporated ditch, and under the new amendments, any ditch held by joint owners not incorporated and not in partnership, where rights have been adjudicated in accordance with existing decrees. The amendments no longer require the Commissioner to take an oath, or file a bond. But should personal interests and prejudice arise, the Commissioner shall be disqualified and a substitute commissioner appointed to act in the matter in which the conflict of interest exists. All water commissioners, when on duty, shall make reports upon the request of the division superintendent. (Hadoulias-Florida)
W77-08406

GREAT SALT LAKE MANAGEMENT AND DEVELOPMENT.
Utah Code Ann. secs. 65-8a-1 thru -10 (Supp. 1975).

Descriptors: *Utah, *Great Salt Lake, *Administrative agencies, Legislation, Water conservation, Administration, Governments, State governments, Local governments, Legal aspects, Regulation, Water law, Institutions, Water policy, Water resources, Recreation, Flood control, Wildlife conservation, Wildlife management, Industrial production, Conservation, Adoption of practices, Administrative decisions, Administrative costs, Allotments, Comprehensive planning, Decision making, Project planning.

The Utah state legislature recognizes that the Great Salt Lake is a unique natural resource which requires a coordinated institutional arrangement utilizing existing county, state, and federal divisions and agencies in order to protect a balanced use of the resources. An appropriate institutional arrangement is necessary in order to establish and coordinate programs for the development of recreation areas, flood control, wildlife resources, industrial uses, and conservation of the Great Salt Lake. Therefore, a special division is created within the department of natural resources, and a Great Salt Lake board appointed. The twelve-member board shall have the power to establish policy and promulgate rules and regulations consistent with this Act. The division shall have the general responsibility for directing activities and implementing all plans regarding the lake. Other duties include fostering future water development, preparing comprehensive plans, supervising the lake flood plain, regulating waste dischargers, maintaining and creating recreational and wildlife areas, employing other assistants and advisers, handling fund disbursement and receipts, and performing all other acts reasonably necessary to carry out the purposes and provisions of the Act, thereby insuring proper management of Great Salt Lake. A POSTSCRIPT TO THE MUTUAL PRESCRIPTION DOCTRINE--CITY OF LOS ANGELES V CITY OF SAN FERNANDO,
J. N. Murdock.
Land and Water Law Review, Vol 11, p 131-146 (1976). 16 p, 57 ref.

Descriptors: *California, *Prescriptive rights, *Overdraft, *Water allocation(Policy), *Proration, Water rights, Groundwater, Legal aspects, Pumping, Water supply, Withdrawal, Water resources development, Water utilization, Cities, Watersheds(Basins), Water demand, Water requirements, Judicial decisions, Safe yield, Hydrologic data, Forecasting.

In 1949, the California Supreme Court established the mutual prescription doctrine in City of Pasadena v. City of Alhambra. This doctrine resulted in overdevelopment of California groundwater basins since it rewarded those users who extracted more than their allocation by giving them prescriptive rights against other users in proportion to the actual amount taken rather than the amount allotted. Therefore, it was in every user's best interest to overpump to keep from losing water. In 1975, the court reexamined the problem and adopted a new formula for allocation of groundwater in an overdrafted basin. The court established a stringent standard for notice of adverse use and held that the exemption of municipalities from prescription was applicable to prescription of groundwater. The author suggests that this decision may remove the incentive for overdevelopment of California's groundwater basins. He warns other states against applying a pro rata solution to overdrafting in light of the California experience since such a solution is likely to cause long term disruption due to the subsequent uncertainty of ownership of water rights. (Capehart-Florida)

ALLOCATING BURIED TREASURE: FEDERAL LITIGATION INVOLVING INTERSTATE GROUND WATER,
W. P. Pendley.
Land and Water Law Review, Vol 11, p 103-130 (1976). 28 p, 114 ref.

Descriptors: *Water management(Applied), *Groundwater, *Aquifer management, *State jurisdiction, *Equitable appointment, Prior appropriation, Reservation doctrine, Surface waters, Interstate rivers, Interstate compacts, Beneficial use, Federal government, State governments, Judicial decisions, Legal aspects, Riparian rights, Irrigation, Surface-groundwater relationships, Groundwater resources, Groundwater basins, Reasonable use, Water utilization.

Although groundwater is a water source which must be increasingly utilized in the future, no law has yet been developed for interstate groundwater rights and allocation. An examination of federal court decisions involving interstate surface waters is made here to determine their applicability to groundwater situations. The major problem is a jurisdictional one since a complaining state must meet a heavy burden of proof by showing that the threatened groundwater use poses serious danger. The cost of obtaining such evidence may well be prohibitive. A further requirement of showing real and substantial, rather than potential, harm could mean that litigation would be too late to prevent damage to groundwater basins. The development of a doctrine of equitable apportionment of groundwater must take into account the correlation between ground and surface water. The courts have not yet recognized such a correlation. Although the interstate compact may be the most desirable solution to problems of interstate groundwater allocation, the most probable response is interstate litigation. (Capehart-Florida)

FLOOD MANAGEMENT: WHO BENEFITS AND WHO PAYS,
Massachusetts University, Amherst. Dept. of Food and Resource Economics.
J. H. Foster.
Water Resources Bulletin, Vol. 12, No. 5, October 1976, p. 1029-1039, 1 tab, 3 ref. OWRT B-028-MASS(7), 14-31-0001-3896.

Descriptors: *Cost-benefit analysis, Alternative costs, *Flood protection, *Flood control, *Alternative planning, Flood plain insurance, Land use, Flood plain zoning, Planning, Management, Floodproofing.
Identifiers: *Flood management.

The distribution of costs and benefits among groups in society of alternative flood management actions is examined in terms of their final incidence or resting place--their influence on real estate values. The alternatives examined include structures, disaster relief, floodproofing, watershed land treatment, floodplain zoning, and flood insurance. The impact of each alternative on the amount of flood disability cost paid by the landowner is examined and variations among alternatives are used to explain the past political success of structures and reliefs as compared to zoning, floodproofing, and insurance. (Lefferts-Massachusetts)

FLOOD PLAINS FOR OPEN SPACE AND RECREATION.
Bureau of Outdoor Recreation, Washington, D. C.
For sale by Supt of Documents, US Govt Printing Office Washington, D.C. 20402. Price $1.10 (single copy). Outdoor Recreation Action, No 39, p 3-16. 24 photo. (1976).

Descriptors: *Recreation, *Flood control, *Rivers, *Flood plains, Land use, Reservoir operation, Recreation facilities, Reservoirs, Parks, Dams, Flood damage, Water policy, River basin development, Floodways, Flood protection, Flood plain insurance, Non-structural alternatives, Watershed management.
Identifiers: *Water Resources Development Act, *Land and Water Conservation Fund Program.

The flood plain is nature's arrangement for periodic flood storage and discharge. Exceptional flooding conditions will eventually cause a stream to reclaim its flood plain regardless of what structures man has placed there. Extensive flood

damages to residential and business areas throughout the United States, in the early 1970s resulted in a National Forum on 'The Future of the Flood Plain' held in 1975. Participants in the Forum, including the Bureau of Outdoor Recreation, the US Army Corps of Engineers, The League of Women Voters, and the National Association of Counties, made 50 or more recommendations on flood plain management. Among these recommendations were: a call for a statement of national policy, with criteria for state and local governments to use in planning; identification of critical areas and long-term management plans; expansion of technical assistance in flood plain management; passage of flood plain zoning and standards; and purchase of flood plains when necessary. In many areas of the United States, programs have been implemented which combine flood control projects with outdoor recreation, utilizing non-structural alternatives to development of the flood plain, such as parks, bikeways, golf courses, and playgrounds The article describes typical programs in various states. U.S. ENVIRONMENTAL PROTECTION AGENCY ENVIRONMENTAL RESEARCH OUTLOOK FY 1976 THROUGH 1980 (REPORT TO CONGRESS).
Environmental Protection Agency, Washington, D.C. Office of Research and Development.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-250 523, Price codes: A08 in paper copy, A01 in microfiche. Report EPA-600/9-76-003, February 1976. 158 p, 2 fig, 18 photo, 7 tab, 1 append.

Descriptors: *Federal government, *Comprehensive planning, *Administrative agencies, *Environmental effects, Future planning(Projected), *Research and development, *Research priorities, Waste water treatment, Industrial production, Planning, Water pollution sources, Pollution abatement, Governmental interrelations, Industrial wastes, Public health, Water pollution control, Water quality control.

The Office of Research and Development (ORD) was created to conduct a comprehensive and integrated research program for the Environmental Protection Agency (EPA). In a report on the first five year Research Plan, ORD describes research, priorities and trends for the fiscal years 1976-1980. The report covers ORD's five major programs: Health and Ecological Effects, Industrial Processes, Public Sector Activities, Monitoring and Technical Support, and Energy/Environment. Research for developing and improving criteria for pollution control in freshwater systems, and the assessment of progress in marine and estuarine systems is emphasized. The setting of standards for industrial pollution control requires examination of all media, air, water and land, in order to avoid merely transferring pollution impacts from one medium to another. Increased attention will be given to methods to improve the performance and reduce the cost of waste water treatment systems. Priority is placed on the Health and Industrial Processes programs. Monitoring of pollution sources and agreements with other federal agencies are also described. Increased pollution sources and agreements with other federal agencies are also described. Increased pollution control technology is needed in the industrial arena if the 1985 water quality goals are to be achieved. (Molloy-Florida)

ENVIRONMENTAL PROTECTION THROUGH THE COMMON LAW,
Calgary Univ. (Alberta). Faculty of Environmental Design.
P. S. Elder.
Western Ontario L Rev, Vol 12, p 107-71 (1973). 391 ref.

Descriptors: *Common law, *Pollution abatement, *Water pollution control, *Legal aspects, *Negligence, *Trespass, Hazards, Water law, Penalties(Legal), Remedies, Riparian land, Riparian rights, Water rights, Prescriptive rights, Industries, Control, Governments, Legal review, Judicial decisions.
Identifiers: *Nuisance(Legal aspects), *Injunctions(Prohibitory), Absolute liability, Evidence, Intentional torts, Standing(Legal), Statute of limitations.

The explosion of ecological publications and the extensive media coverage has convinced everyone that an environmental crisis exists. Government and industry both have attempted to alleviate the problem and both have been, for the most part, unsuccessful. One avenue of pollution abatement that has been little used is the ordinary common law. Private persons can maintain actions against polluters based upon trespass, negligence and ultrahazardous activities. However, the conservative drawbacks of the common law often make such attempts fruitless. The procedural drawbacks of expert witnesses, funds, time, problems of proof and the requirement of a private property interest should be analyzed and radically redesigned. Substantively, the causes of action themselves should be liberalized. A suit in nuisance should be permitted for an interference with a private right despite the fact that the individual has suffered no particular, direct, and substantial damage. The law of riparian rights should allow an injunction enjoining any pollution whatever without requiring any proof of actual damage to property. Defendants should be barred from claiming any prescriptive right to pollute even though their action may have existed for the requisite period of time. In the absence of extraordinary circumstances, an injunction against pollution should be issued immediately, ignoring the balancing of conveniences. (Moorhouse-Florida)

TRUE-TEMPERATURE DETERMINATION OF GEOTHERMAL RESERVOIRS,
Texas Instruments, Inc., Dallas, Tex.
D. J. Jin.
Geoexploration, Vol 15, No 1, p 1-9, January, 1977. 16 ref.

Descriptors: *Geothermal studies, *Thermal water, *Water temperature, *Resistivity, Electrical studies, Electronic equipment, Porous media, Saline water, Electrolytes.
Identifiers: *Geothermal reservoirs, *Temperature measurement.

Dwindling supplies of hydrocarbon resources and the many advantages of utilizing terrestrial heat for power generation have sparked intense new interest in geothermal reservoir development. Several techniques are curently being used to determine the extent of geothermal fields, and the electrical resistivity method has proved to be one of the most effective. It is also possible to measure the temperature of geothermal reservoirs via resistivity surveys. The following formula explicitly gives the temperature of a geothermal reservoir: t sub h = t sub c + (1/alpha) ((rho sub c/rho sub h)-1). T sub h and rho sub h are, respectively, the temperature and resistivity of the hot portion of the earth, i.e., the reservoir; t sub c and rho sub c are, respectively, the temperature and resistivity of the cold (surface) portion of the earth, and alpha is the temperature coefficient of resistivity of the ground water in the area under question. Rho sub c and rho sub h are calculated from resistivity survey field data while alpha is determined by laboratory measurements. Experimentation is still necessary, however, before this formula can be assumed valid for geothermal fields of very high temperatures (300 C and up). (Eberle-NWWA)

PROCEEDINGS OF THE NASA EARTH RESOURCES SURVEY SYMPOSIUM, JUNE 1975, VOLUME I-A, TECHNICAL SESSION PRESENTATIONS, AGRICULTURE-ENVIRONMENT.
National Aeronautics and Space Administration, Houston, Tex. Lyndon B. Johnson Space Center.
Available from the National Technical Information Service, Springfeild, VA 22161 as N76-17588, Price codes: A23 in paper copy, A01 in microfiche. Report No. NASA TM X-58168. Symposium held June 9-12, 1975, Houston, Texas, September 1975 (3 Vol.). 595 p. Smistad, O., Coordinator.

Descriptors: *Conferences, *Remote sensing, *Agriculture, *Environment, Satellites(Artificial), Land use, Water quality, Mapping, Range management, Land management, Marshes, Wetlands, Data processing, Monitoring, Forests, Vegetation, Revegetation, Resources, Land resources.
Identifiers: *LANDSAT, Skylab.

The reported symposium combined with utilization and results of data from NASA programs involving LANDSAT, the Skylab Earth resources experiment package, and aircraft, as well as information from other data acquisition programs. The primary emphasis was on the practical applications of Earth resources survey technology, which is of interest to a large number of potential users. Also featured were scientific and technological exploration and research investigations with potential promising applications. Technical sessions were structured to provide governmental and private organizations with a comprehensive picture of various applications in the management and implementation of remote-sensing data use in their own programs. Volume I-A contained technical papers related to agriculture and environment. (See W77-08409 thru W77-08438) (Humphreys-ISWS)

WATER RESOURCES DATA FOR INDIANA, WATER YEAR 1975,
Geological Survey, Indianapolis, Ind. Water Resources Div.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-251 859, Price codes: A16 in paper copy, A01 in microfiche.
Water-Data Report IN-75-1, March 1976. 355 p, 3 fig, 22 ref.

Descriptors: *Indiana, *Hydrologic data, *Surface waters, *Groundwater, *Water quality, Gaging stations, Streamflow, Flow rates, Sediment transport, Water analysis, Chemical analysis, Lakes, Reervoirs, Water wells, Water levels, Sampling, Sites.
Identifiers: Annual State report(Ind).

Water resources data for the 1975 water year for Indiana consist of records of stage, discharge, and water quality of streams; stage, contents, and water quality of lakes and reservoirs; and water levels in wells. This report contains discharge records for 182 gaging stations; and water levels for 15 observation wells. Partial-record stations include 104 crest stage, 52 low flow, and 20 low and high flow. Additional water data were collected at various sites, not part of the systematic data-collection program, and are published as miscellaneous measurements. These data represent that part of the National Water Data System operated by the U.S. Geological Survey and cooperating State and Federal agencies in Indiana. (Woodard-USGS)
W77-08162

SELECTED WATER-LEVEL RECORDS FOR WESTERN OKLAHOMA, 1950-1975,
Geological Survey, Oklahoma City, Okla. Water Resources Div.
R. L. Goemaat.
Open-File report 77-73, January 1977. 94 p, 1 fig, 1 tab.

Descriptors: *Groundwater, *Water wells, *Water levels, *Water level fluctuations, *Oklahoma, Basic data collections, Irrigation, Observation wells, Aquifers, Groundwater availability.
Identifiers: Western Oklahoma.

Ground-water-level measurements and water level changes are presented for about 900 wells in 19 counties of western Oklahoma where ground water is heavily used for irrigation. Measurements made in major aquifers of the area including the Ogalalla Formation, rush Springs Sandstone, Blaine Gypsum, Cimarron terrace, and Tillman terrace. The data are subdivided by counties. (Woodard-USGS)
W77-08163

GROUND-WATER DATA FOR 1974-75 IN JOSHUA TREE NATIONAL MONUMENT, CALIFORNIA,
Geological Survey, Menlo Park, calif. Water Resources Div.
D. J. Downing.
Open-File report 77-80, January 1977. 34 p, 2 fig, 4 tab, 3 ref.

Descriptors: *Groundwater, *Water levels, *Water quality, *Water wells, *Water yield, Pumping, Basic data collections, Observation wells, California, National Parks.
Identifiers: *Joshua Tree National Monument(Calif).

This report, prepared at the request of the National Park Service, is part of a continuing inventory by the U.S. Geological Survey of general geohydrologic conditions at Joshua Tree National Monument, California. Tables of data for 1974-75 includes chemical analyses of ground water from selected wells and pumpage by Kaiser Steel Corporation from Pinto Basin. The table for yearly pumpage totals by Kaiser Steel Corporation includes years 1960-75. Water-level measurements are included for 22 observation wells. (Woodard-USGS)

SUBSURFACE-TEMPERATURE DATA FOR SOME WELLS IN WESTERN UTAH,
Geological Survey, Salt Lake City, Utah. Water Resources Div.
F. E. Rush.
Open-File Report 77-132, January 1977. 84 p, 1 fig, 1 tab.

Descriptors: *Subsurface investigations, *Geothermal studies, *Wells, *Utah, *Temperature, Measurement, Methodology, Depth, Data collections, Sites.
Identifiers: *Electronic thermometer.

This hydrothermal reconnaissance of the State of Utah contains temperature-profile data for 30 wells. Most of the wells were small-diameter geothermal-exploration wells. Some were stock, domestic, or irrigation wells. Temperatures were measured using thermistor, 4-conductor cable, and a digital multimeter. Meter readings were in ohms, but were converted to temperature by a calibration graph. The electronic thermometer is capable of an accuracy to 0.01 deg C, and the highest temperature measured was 107.80 deg C in the only well to have measurements of 100 deg C or higher. Because of variations in field conditions, the temperature data in many wells probably is accurate only to 0.1 deg C. Depths below land surface were measured using a sheave and attached counter. GROUND-WATER BASIC DATA FOR RAMSEY COUNTY, NORTH DAKOTA,
Geological Survey, Bismarck, N. Dak. Water Resources Div.
R. D. Hutchinson.
North Dakota County Ground-Water Studies 26--Part II, and North Dakota Geological Survey Bulletin 71--Part II, Bismarck, N.D., 1977. 344 p, 2 fig, 1 plate, 5 tab, 25 ref, append.

Descriptors: *Hydrologic data, *Groundwater resources, *Aquifer characteristics, *Well data, *Water quality, Water levels, Hydrogeology, Drillers logs, Test wells, Water yield, Chemical analysis, North Dakota.
Identifiers: *Ramsey County(N Dak).

This report contains basic data for 1,145 wells and test holes in Ramsey County, North Dakota. Included are 452 logs of test holes and wells, 209 chemical analyses of water samples, and water-level measurements in 73 observation wells. The purpose of the investigation was to provide detailed geologic and hydrologic information needed for the orderly development of water supplies for municipal, domestic, livestock, irrigation, industrial, and similar uses. Specifically, the objectives were to: (1) determine the location, extent, and nature of the major aquifers and confining beds; (2) evaluate the occurrence and movement of ground water, including the sources of recharge and discharge; (3) estimate the potential yields of wells; (4) evaluate the quality of the ground water; and (5) estimate the water use. (Woodard-USGS)
W77-08177

DATA FOR CALIBRATING UNSTEADY-FLOW SEDIMENT-TRANSPORT MODELS, EAST FORK RIVER, WYOMING, 1975,
Geological Survey, Lakewood, Colo. Water Resources Div.
H. A. Mahoney, E. D. Andrews, W. W. Emmett, L. B. Leopold, and R. H. Meade.
Open-File Report 76-22, December 1976. 293 p, 12 fig, 39 tab, 10 ref.

Descriptors: *Sediment transport, *Unsteady flow, *Alluvial channels, *Channel morphology, *Mathematical models, Data collections, Evaluation, Bed load, Particle size, Cross-sections, Stage-discharge relations, Streamflow, Flow rates, Sediment yield, *Wyoming.
Identifiers: *East Fork River(Wyo).

In 1975, data to calibrate a one-dimensional unsteady-flow and sediment-transport routing model were collected on a reach of the East Fork River of western Wyoming. The reach, 3.1 miles in length, was immediately upstream from a previously established bedload sampling station. Nineteen channel cross sections were sounded at regular intervals during the spring-runoff period. Four stage recorders provided continuous records of water-surface elevations. Samples of bed material at most of the cross sections were obtaind prior to high water. Streamflow and sediment-discharge measurements were collected at four of the sections. The physiography and hydrology of the contributing watershed, the study reach, and the equipment and techniques used in data collection are described. The bulk of the report is a presentation of data for late May to early June 1975, for which concurrent water discharge data, bedload transport and size data, and cross-section depth measurements were collected. In addition, some data collected in 1973 and 1974 and before and after the calibration period in 1975 are included. (Woodard-USGS)
W77-08180

SELECTED HYDROLOGIC DATA, UINTA BASIN AREA, UTAH AND COLORADO,
Geological Survey, Salt Lake City, Utah. Water Resources Div.
J. W. Hood, J. C. Mundorff, and D. Price.
Utah Basic-Data Release No 26, Salt Lake City, 1976. 321 p, 9 fig, 2 plates, 15 tab, 19 ref.

Descriptors: *Hydrologic data, *Utah, *Colorado, *Water resources, *Water quality, Basic data collections, Surface waters, Groundwater, Observation wells, Well data, Aquifers, Water levels, Streamflow, Flow rates, Chemical analysis.
Identifiers: *Uinta Basin area (Utah and Colo).

The Uinta Basin area in northeastern Utah and northwestern Colorado covers an area of slightly more than 10,000 sq mi. More than 95 percent of the basin is in Utah, thus most of the data in this report apply to Utah. Selected data are consolidated from available records of water wells, springs, petroleum-test wells, and streams. Included are well logs, laboratory analyses of grain-size distribution and hydrologic properties of

aquifer samples, water levels in observation wells, stream discharge, and water-quality records for all types of water sources. (Woodard-USGS)
W77-08183

WATER RESOURCES DATA FOR ILLINOIS, WATER YEAR 1975,
Geological Survey, Champaign, Ill. Water Resources Div.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-254 434, Price codes: A12 in paper copy, A01 in microfiche. Water-Data Report IL-75-1, April 1976. 408 p, 4 fig, 4 tab, 29 ref.

Descriptors: *Illinois, *Hydrologic data, *Surface waters, *Groundwater, *Water quality, Gaging stations, Streamflow, Flow rates, Sediment transport, Water analysis, Chemical analysis, Lakes, Reservoirs, Water wells, Water levels, Sampling, Sites.

Water resources data for the 1975 water year for Illinois consist of records of stage, discharge, and water quality of wells. This report contains discharge records for 174 gaging stations; stage only records for 5 gaging stations; stage and contents for 3 lakes and reservoirs; stage only for 5 lake stations; water quality for 41 gaging stations; and water levels for 3 observation wells. Also included are data for 148 crest-stage partial-record stations and 251 flood-profile stations. Additional water data were collected at various sites, not part of the systematic data collection program, and are published as miscellaneous measurements. These data represent that part of the National Water Data System operated by the U.S. Geological Suurvey and cooperating State and Federal agencies in Illinois. (Woodard-USGS)
W77-08184

WATER RESOURCES DATA FOR NEVADA, WATER YEAR 1975,
Geological Survey, Carson City. Nev. Water Resources Div.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-254 431, Price codes: A14 in paper copy, A01 in microfiche. Water-Data Report NV-75-1, March 1976. 292 p, 8 fig, 4 tab, 35 ref.

Descriptors: *Nevada, *Hydrologic data, *Surface waters, *Groundwater, *Water quality, Gaging stations, Streamflow, Flow rates, Sediment transport, Water analysis, Chemical analysis, Lakes, Reservoirs, Water wells, Water levels, Sampling, Sites.

Water resources data for the 1975 water year for Nevada Consists of records of discharge and water quality of streams; stage, contents, and water quality of lakes and reservoirs; and water levels in wells. This report contains discharge records for 120 gaging stations; stage and contents for 21 lakes and reservoirs; water-quality data for continuing-record stations at 23 stream sites and for partial-record stations at 5 stream sites and 2 lake sites; and water levels for 62 observation wells. Also included are 121 crest-stage partial-record stations and 13 low-flow partial-record stations. Additional water data were collected at various sites, not part of the systematic data collection program, and are published as miscellaneous measurements. These data represent that part of the National Water Data System operated by the U.S. Geological Survey and cooperating State and Federal agencies in Nevada. (Woodard-USGS)

A COMPUTERIZED INFORMATION SYSTEM RELATING TO ARIZONA'S WATER RESOURCES,
Arizona Univ., Tucson. Office of Arid Lands Studies.
K. E. Foster.
In: 1973 Proceedings Institute of Environmental Sciences, p. 341-344. 2 fig, 1 tab, 20 ref. OWRT A-031-ARIZ(4), 14-31-0001-5003.

Descriptors: Data storage and retrieval, Hydrologic data, Data processing, *Arizona, Information exchange, Administrative agencies, State government, Local governments, *Information retrieval.
Identifiers: *Information systems.

Water in Arizona is a vital natural resource, that in some portions of the State, is diminishing from groundwater storage at a rapid rate as increased pumping for agricultural, municipal and mining purposes accelerate. Currently in Arizona there exists six State agencies, seven federal agencies, and countless local irrigation districts and city water departments which have specific statutory responsibilities or administrative needs for inventorying, conserving, developing, managing, operating, protecting, and/or monitoring the water resources and related facilities of the State. These divergent information sources plus many university sources suggest the strong need for a system that can make information from a variety of sources accessible to the many different user groups in Arizona a central objective.

Descriptors: *Mapping, *Vegetation, *Remot sensing, *Natural resources, Land use, Area Satellites(Artificial), Distribution pattern Forests, Classification, Surveys.
Identifiers: *LANDSAT, *Unesco, Physio nomic.

The United Nations Education, Scientific and Cu tural Organization (UNESCO) has recent published a vegetation classification system. Th system, based on the physiognomy of the veget tion, is designed to provide a comprehensiv framework for the preparation of vegetation ma of any part of the world at scales of 1:1,000,000 less. The utility of the system lies in the fact th optimal agricultural land uses are always related

the natural vegetation. The system is designed for use with maps covering large areas. The large map area, however, poses a severe problem in uniform data collection, especially if large-scale imagery is employed as a mapping base. Since LANDSAT images have a basic utilization scale of 1:1,000,000, identical to that of the projected maps, they would serve as a uniform base for all parts of the world if they contained the information necessary to delimit vegetation formations. To determine if the information content of the imagery is sufficient to permit mapping according to the Unesco classification, a series of test sites was examined. These sites included examples from the humid tropics, arid and semi-arid subtropics, and temperate zones. In every case, the feasibility of this application of LANDSAT imagery was verified. The imagery may, therefore, be used as a mapping base for the preparation of vegetation maps on the millionth scale. (See also W77-08408) (Humphreys-ISWS)

OPERATIONAL CONSIDERATIONS FOR THE APPLICATION OF REMOTELY SENSED FOREST DATA FROM LANDSAT OR OTHER AIRBORNE PLATFORMS,
Saint Regis Paper Co., Jacksonville, Fla. Southern Timberlands Div.
G. R. Barker, and T. P. Fethe.
In: Proceedings of the NASA Earth Resources Survey Symposium, June 1975, Technical Session Presentations, Agriculture-Environment, Volume I-A. Report No. NASA TM X-58168. Symposium held June 9-12, 1975, Houston, Texas, p 115-133, September 1975, 6 fig, 2 tab, 10 ref.

Descriptors: *Forest management, *Pulp and paper industry, *Remote sensing, *Lumbering, *Southeast U.S., Mapping, Forests, Trees, Pine trees, On-site investigations, Analytical techniques, Data processing, Sampling, Surveys, Photogrammetry, Land use, Satellites(Artificial), Aerial photography.
Identifiers: LANDSAT.

The forest data base requirements necessary to manage efficiently a large, timber based forest industry of the 1970's have transcended by a considerable margin those data required two decades ago. These data demands have grown, both in quantitative terms and in the level of precision acceptable to successfully undertake the multiple decision making processes required. From the traditional generation of area/volume and frequency tables used in immediate planning for harvest and cultural activity, data are now subjected to the rigors of long-range planning manipulations, as these data represent the major input to such planning models. To be effective in such planning activity, the data must be provided in a timely manner. Concurrent with the increase in data demand and the speed of preparation, has been the ever increasing difficulty in securing and reducing these data within the timetables demanded. Remote sensing techniques at all levels seemed to offer the most promising prospect in satisfying the data requirements and in alleviating the difficult task of collecting the data. After a thorough review of the technology of remote sensing and the state of the art of interpretation, it was realized that the best hope for a practical, implementable scheme was to approach the problem in three phases, all interrelated, but independent enough to allow for the progressive modular development of a multilevel sampling system. At each stage, operational feasibility will be evaluated so that necessary revisions can be integrated into the system as needed. (See also W77-08408) (Humphreys-ISWS)

J. D. Nichols.
In: Proceedings of the NASA Earth Resources Survey Symposium, June 1975, Technical Session Presentations, Agriculture-Environment, Volume I-A. Report No. NASA TM X-58168. Symposium held June 9-12, 1975, Houston, Texas, p 159-166, September 1975. 3 tab.

Descriptors: *Forest management, *California, *Remote sensing, *Forest fires, *Mapping, Analytical techniques, Analysis, Satellites(Artificial), Data processing, Trees, Grasses, Brush, Fuels, Vegetation, Classification.
Identifiers: LANDSAT, *Wildland fuels.

LANDSAT digital MSS data were successfully used to map and evaluate the wildland fuels of the Santa Monica Mountains in Southern California. A mixed classification scheme was used where training areas of known vegetation types were entered, and the maximum likelihood classifier run, followed by an evaluation of the results and an unsupervised retraining of the classifier using an image of the probability of misclassification. Estimation of maturity class and crown closure percents of the major cover types were assigned to each computer class by associating the photo interpretation of 159 large-scale photo samples, with the resultant computer classes using analysis of variance and analysis of categorized data. The result of the computer classification and statistical analysis was then transformed from the LANDSAT Coordinate California State Plane Coordinate system for use in a digital format in the FIRESCOPE data retrieval and fire modeling system. COMPUTER ANALYSIS AND MAPPING OF GYPSY MOTH DEFOLIATION LEVELS IN PENNSYLVANIA USING LANDSAT-1 DIGITAL DATA,
National Aeronautics and Space Administration, Greenbelt, Md. Goddard Space Flight Center.
D. L. Williams.
In: Proceedings of the NASA Earth Resources Survey Symposium, June 1975, Technical Session Presentations, Agriculture-Environment, Volume I-A. Report No. NASA TM X-58168. Symposium held June 9-12, 1975, Houston, Texas, p 167-181, September 1975. 3 fig, 1 tab, 22 ref.

Descriptors: *Forest management, *Pennsylvania, *Mapping, *Remote sensing, Insects, Data processing, Surveys, Forests, Entomology, Spatial distribution, Satellites(Artificial), Foliar, Leaves.
Identifiers: *Defoliation, LANDSAT, *Gypsy moths defoliation.

The purpose of this study was to investigate the effectiveness of using LANDSAT-1 multispectral digital data and imagery, supplemented by ground truth and aerial photography, as a new method of surveying gypsy moth (Porthetria dispar (L.) (Lepidoptera; Lymantriidae) defoliation, which has greatly increased in Pennsylvania in recent years. Since the acreage and severity of gypsy moth defoliation reaches a peak from mid-June through the first few days of July, the July 8, 1973, LANDSAT-1 scene was chosen for analysis. Results indicated that LANDSAT-1 data can be used to discriminate between defoliated and healthy vegetation in Pennsylvania, and that digital processing methods can be used to map the extent and degree of defoliation. THE USE OF SKYLAB DATA TO STUDY THE EARLY DETECTION OF INSECT INFESTATIONS AND DENSITY AND DISTRIBUTION OF HOST PLANTS,
Agricultural Research Service, Weslaco, Tex. Southern Region Citrus Insects Research.
W. G. Hart, S. J. Ingle, and M. R. Davis.
In: Proceedings of the NASA Earth Resources Survey Symposium, June 1975, Technical Session Presentations, Agriculture-Environment, Volume I-A. Report No. NASA TM X-58168. Symposium held June 9-12, 1975, Houston, Texas, p 203-219, September 1975. 8 fig, 5 ref.

Descriptors: *Vegetation, *Plant groupings, *Texas, *Remote sensing, Insects, Infection, Classification, Spatial distribution, Citrus fruits, Satellites(Artificial), Aerial photography, Instrumentation, Agriculture, Mapping, Photography.
Identifiers: *Insect infestations, *Host plants, Skylab.

A study of the detection of insect infestations and the density and distribution of host plants was undertaken, using Skylab data, aerial photography, and ground truth, simultaneously. Additional ground truth and aerial photography was acquired between Skylab passes. For the evaluation of S-190B data, two 100 square-mile areas within the task site were selected. Area 1, of high density citrus, was located northwest of Mission, Texas. Area 2, located 20 miles north of Weslaco, Texas, contained different varieties of citrus, winter vegetables, sugarcane, irrigated pastures, and brush-covered land. Skylab S-190A data was also evaluated for similar information over the entire Rio Grande Valley and adjacent areas of Mexico. Satellite data such as that obtained from Skylab S-190B offers promise for detection of some insect pests and the distribution of host plants of various insect pests. With comparative observations of film types and seasonal influences on reflectance characteristics, many crop varieties can be identified with Skylab S-190B data. Vegetative patterns in border areas can be detected with Skylab S-190A and S-190B data. This information can be useful in detection avenues of entry of pest species and areas of stress that require greater vigilance in stopping the spread of destructive species. The influence of some environmental factors on crops thay may be confused with pest injury or related factors can be detected and identified with Skylab S-190B data. Descriptors: *Ecosystems, *Monitoring, *Remote sensing, *Colorado, *California, *Nevada, Mapping, Satellites(Artificial), Water resources, Natural resources, Vegetation, Land use, Costs, Soils, Evaluation, Sampling, Topography, Management, Census, Spatial distribution, Data processing, Aerial photography.
Identifiers: LANDSAT, Skylab.

The paper presented comparative statistics on the capability of LANDSAT-1 and three of the Skylab remote sensing systems (S-190A, S-190B, and S-192) for the recognitiion and inventory of analogous natural vegetations and landscape features that are important in resource allocation and management. Investigations were conducted in two analogous regions presenting vegetational zonation from salt desert to alpine conditions above timberline. The visual interpretation mode was emphasized. An hierarchical legend system was used as the basic classification of all land surface features. Given adequate ground truth and a knowledge of what to expect ecologically within each region, it was possible to map and identify many features to the fourth hierarchical (frist floristic) level in the classification system. Fourth level decisions were, however, strongly based on recognizing associated features and convergence of evidence. Identifications at second and third levels (physiognomic and structural criteria) were generally photo-identifiability with the difference sensor systems, and mapping and interpretation tests were made, both in monocular and stero interpretation, with all systems except the S-192. Significant advantage was found in the use of stereo from space when image analysis is by visual or visual-machine-aided interactive systems. Some cost factors in mapping from space were identified. The various image types were compared, and an operational system was postulated. (See also W77-08408) (Humphreys-ISWS)

Preprint BNL 20665, November 1975. 22 p, 16 fig, 8 ref.

Descriptors: *Monitoring, *Instrumentation, *Estuaries, Equipment, Sampling, Data collections, Environment, Coasts, Tidal waters, Temperature, Water temperature, Conductivity, Currents(Water), Velocity, Telemetry, Automation, Oceanography.
Identifiers: *Data acquisition systems, Remote sampling systems.

A real time data acquisition and monitoring system was developed for coastal oceanographic parameter measurements. This system continuously measures profiles of temperature, conductivity, current velocity, and direction as a function of depth at a number of fixed offshore locations. The data acquisition, monitoring, and control system features make this system generally suitable for unattended area monitoring applications. (Sims - ISWS)

A GUIDE TO THE USE OF HISARS -- A HYDROLOGIC INFORMATION STORAGE AND RETRIEVAL SYSTEM,
Idaho Univ., Moscow. Dept. of Agricultural Engineering.
M. Molnau.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-268 226, Price codes: A05 in paper copy, A01 in microfiche. Agricultural Experiment Station, Miscellaneous Series, No. 32, December 1975. 82 p, 19 ref. OWRT A-045-IDA(1).

Descriptors: *Hydrologic data, *Data collections, *Data storage and retrieval, Publications, *Information retrieval, *Computer programs.
Identifiers: *HISARS manual.

The HISARS (Hydrologic Information Storage and Retrieval System) was developed out of a need to have a large body of hydrologic data available for ease of access. In this system the data are stored on a magnetic disk pack and the data retrieved by the Indexed Sequential Access Method (ISAM). This manual is organized into three sections; the ACCESS facilities, the PROCESS facilities, the COPY facilities. The ACCESS facilities allow a user to obtain listings of data in a standard format. These are described in detail. The PROCESS facilities allow routine types of analyses on the data. These are described in detail. The PROCESS facilities allow routine types of analyses on the data. These are relatively standard types of programs. The COPY facility allows the user to copy data from the disk pack and store it on a private tape or data set where it will be used as input to a user written program.

THE EUTAW-MCSHAN AQUIFER IN MISSISSIPPI,
Geological Survey, Jackson, Miss. Water Resources Div.
E. H. Boswell.
Water-Resources Investigations 76-134 (open-file report), March 1977. 2 sheets, 17 fig, 3 tab, 20 ref.

Descriptors: *Groundwater resources, *Aquifer characteristics, *Hydrogeology, *Water quality, *Mississippi, Water supply, Water wells, Water yield, Water level fluctuations, Chemical analysis, *Maps.
Identifiers: *Eutaw Formation(Miss), *McShan Formation(Miss), Cretaceous aquifers.

This report, the fifth in a series of 'atlas-type' reports, summarizes the large amount of unpublished data available for the Eutlaw-McShan aquifer in Mississippi. The Eutaw-McShan aquifer, of Cretaceous age, consists of the interconnected irregular sand beds in the Eutaw and McShan Formations. The aquifer contains fresh water in an area of about 8,000 sq mi in northeastern Mississippi. Water produced from the aquifer by 59 water systems and several industries in 1975 averaged about 24 mgd. Water levels have declined about 200 feet below levels of the early 1900's at Tupelo and West Point and it is estimated that the aquifer is developed to near its potential yield at those places. The aquifer is used extensively in areas where the dissolved-solids concentration of the water is more than 500 mg/liter and in some places where the concentration exceeds 1,000 mg/liter. The most common water-quality problems are excessive chloride and fluoride. (Woodard-USGS)

Descriptors: *Surface runoff, *Hardness(Water), *Phosphates, *Dissolved solids, *Florida, Regional analysis, River basins, Water quality, *Maps, Chemical analysis.
Identifiers: *Northwest Florida, *Orthophosphates.

Historical water-quality data collected from January 1965 to September 1970 were used to prepare maps showing the generalized distribution of dissolved solids, hardness, and orthophosphate in streams and lakes in the Northwest Florida Water Management District. The regional concentration patterns shown on the maps are generalized and local variations may be expected. The dissolved-solids concentrations generally range from 10 to 150 milligrams per liter. Higher concentrations are found in the coastal area on tide affected streams. The concentrations of hardness as CaCO3 generally range from 5 to 140 milligrams per liter. The concentrations of dissolved orthophosphate generally range from 0 to 0.75 milligrams per liter. These maps provide information to those concerned with water resources management and establish a basis for comparing future water-quality data. (Woodard-USGS)

WATER-RESOURCES INVESTIGATIONS IN SOUTH DAKOTA, 1976.
Geological Survey, Huron, S.D. Water Resources Div.
Water-Resources Investigations in South Dakota Folder, 1976. 1 sheet.

Descriptors: *Hydrologic data, *Surface waters, *Groundwater, *Water quality, *South Dakota,

Data collections, Programs, Sites, *Maps, Publications.

This folder contains a brief description of the water-resources investigations in South Dakota in which the U.S. Geological Survey participates and a list of selected references. The principal map shows the location of hydrologic-data stations and the extent of the hydrologic investigations. Small maps give a broad picture of variations in some of the hydrologic characteristics pertaining to South Dakota's water resources. Surface-water data-collection sites include 212 streamflow stations, 9 lake and reservoir stations, and 36 water-quality stations. Ground-water sites include 424 observation wells. Water-quality data are collected at 29 of these wells. (Woodard-USGS)
W77-08468

FLOODS OF NOVEMBER 12, 1974, IN THE CHARLOTTE AMALIE AREA, ST. THOMAS, U.S. VIRGIN ISLANDS,
Geological Survey, Miami, Fla. Water Resources Div.; and Geological Survey, San Juan (Puerto Rico). Water Resources Div.
W. J. Haire, and K. G. Johnson.
Water-Resources Investigations 91-76 (open-file report), 1977. 3 sheets, 6 fig, 3 plates, 1 tab, 3 ref.

Descriptors: *Floods, *Flood profiles, *Virgin Islands, *Flood recurrence interval, Flood stages, Hydrologic data, Evaluation, Land use, Planning, *Maps.
Identifiers: *St Thomas Island, 60-year flood, Inundated areas.

The flood on St. Thomas, U.S. Virgin Islands, of November 12, 1974, was the largest recorded flood in the area from Fort Christian through Charlotte Amalie and Frenchtown to the end of Crown Bay. This flood has a recurrence interval of about 60 years. With the exception of a few narrow beaches, very little flooding occurred outside of the Charlotte Amalie area. The flood boundaries are controlled to a large extent by the prevailing channel and flood-plain conditions. Inundation from future floods may be affected by changes in channel conditions, alteration of waterway openings at roads, changes in runoff characteristics of the stream caused by increased urbanization, and other cultural developments. The areas inundated by the 1974 flood are shown on 2 maps. (Woodard-USGS)

MAPS SHOWING GROUND-WATER CONDITIONS IN THE PUERCO-ZUNI AREA, APACHE AND NAVAJO COUNTIES, ARIZONA--1975,
Geological Survey, Flagstaff, Ariz. Water Resources Div.
L. J. Mann.
Water-Resources Investigations 77-5 (open-file report), January 1977. 3 sheets, 8 ref.

Descriptors: *Groundwater resources, *Water wells, *Water levels, *Water quality, *Arizona, Water table, Mapping, Contours, Profiles, *Maps.
Identifiers: *Apache and Navajo Counties(Ariz), *Puerco-Zuni area(Ariz).

This 3-sheet atlas describes ground-water conditions in the Puerco-Zuni area of northeastern Arizona which includes about 2,800 sq mi. The main source of water is ground water in the several aquifers that are made up of one or more formations. Maps show ground-water conditions in the Coconino aquifer; in the Moenkopi and Chinle Formations; and in the Bidahochi aquifer and the alluvium. Information on the maps includes depth to water, altitude of the water level, and chemical quality of the water; scale 1:125,000. (Woodard-USGS)

TIME OF TRAVEL OF SOLUTES IN THE EAST FORK TRINITY RIVER, NOVEMBER 1975; AND ELM FORK TRINITY RIVER, DECEMBER 1975; TRINITY RIVER BASIN, TEXAS,
Geological Survey, Fort Worth, Tex. Water Resources Div.
D. R. Myers, and R. M. Slade, Jr.
Open-file report 76-683, November 1976. 3 sheets, 2 fig, 2 tab, 4 ref.

Descriptors: *Travel time, *Solutes, *Rivers, *Tracking techniques, *Fluorescent dye, *Texas, Forecasting, Path of pollutants, Data collections, Sampling, Sites, Hydrographs, *Maps.
Identifiers: *East Fork Trinity River(Tex), *Elm Fork Trinity River(Tex).

In Texas, the time of travel of solutes in the East Fork Trinity River and the Elm Fork Trinity River was determined in 1975 by injecting a fluorescent dye (Rhodamine WT, 20-percent solution) that could be detected by fluorometric analysis of water samples collected at selected downstream sites. Plots of dye concentration versus time were made for each injection and sampling site. The graphs were then used to determine arrival times of the leading edge, the peak, and the trailing edge of the dye cloud. The study in November 1975 was conducted on the East Fork Trinity River from just below the Rockwall-Forney Dam at Lake Ray Hubbard to the confluence with the Trinity River, a distance of 27.0 miles. The study in December 1975 was conducted on the Elm Fork Trinity River from just below the dam at Lewisville Lake to the Spur 482 crossing, a distance of 25.7 miles. (Woodard-USGS)

ACTIVITIES OF THE WATER RESOURCES DIVISION IN CALIFORNIA.
Geological Survey, Menlo Park, Calif. Water Resources Div.
California District report, 1977. 20 p, 1 map.

Descriptors: *California, *Water resources, *Programs, *Data collections, Surface waters, Groundwater, Water yield, Water quality, Sediment transport, Projects, Publications.
Identifiers: *US Geological Survey(Calif), 1977 projects, 1976 reports, Cooperating agencies.

This report summarizes the scheduled 1977 activities of the Water Resources Division, U.S. Geological Survey, in California. Reports issued by the Geological Survey on studies completed in 1976 are also listed. Most of these activities are conducted in cooperation with other Federal, State, county, or local public agencies. These cooperating agencies are listed. The investigations of the water resources of California by the Division fall into three broad categories: (1) Hydrologic-data network, (2) resource appraisal studies, and (3) research. The collection of basic data through the hydrologic-data network is concerned with the location, quantity, quality, movement, and occurrence of the water resource. The records appear in annual or regular publications of basic data. Appraisal studies of water-resources conditions on an areal basis or directed to a specific water problem are a significant phase of the program. Research studies are underway to determine fundamental principles and to improve methodology as applied to hydraulics, hydrology, and related fields of science. (Woodard-USGS)

WATER RESOURCES DATA FOR CONNECTICUT, WATER YEAR 1975,
Geological Survey, Hartford, Conn. Water Resources Div.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-254 435, Price codes: A17 in paper copy, A01 in microfiche. Water-Data Report CT-75-1, April 1976. 366 p, 3 fig, 4 tab, 34 ref.

Descriptors: *Connecticut, *Hydrologic data, *Surface waters, *Groundwater, *Water quality, Gaging stations, Streamflow, Flow rates, Sediment transport, Water analysis, Chemical analysis, Lakes, Reservoirs, Water wells, Water levels, Sampling, Sites, Estuaries, Tidal waters.
Identifiers: Annual State report(Conn).

Water resources data for the 1975 water year for Connecticut consist of records of stage, discharge, and water quality of streams; contents and water quality of lakes and reservoirs; and water levels and water quality in wells. This report contains discharge records for 56 gaging stations; tidal volume for 1 gaging station; stage only records for 3 tidal-gaging stations; contents for 36 lakes and reservoirs; water quality for 16 gaging stations, 39 partial-record flow stations, 3 lakes, 12 tidal stations, and 4 wells; and water levels for 27 observation wells. Also included are 65 crest-stage partial-record stations and 55 low-flow partial-record stations. Additional water data were collected at various sites, not part of the systematic data collection program, and are published as miscellaneous measurements. These data represent that part of the National Water Data System operated by the U.S. Geological Survey and cooperating State and Federal agencies in Connecticut. (Woodard-USGS)

WATER RESOURCES DATA FOR NEW YORK, WATER YEAR 1975.
Geological Survey, Albany, N.Y. Water Resources Div.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-256 669, Price codes: A10 in paper copy, A01 in microfiche. Water-Data Report NY-75-1, June 1976. 735 p, 8 fig, 4 tab, 29 ref.

Descriptors: *New York, *Hydrologic data, *Surface waters, *Groundwater, *Water quality, Gaging stations, Streamflow, Flow rates, Sediment transport, Water analysis, Chemical analysis, Lakes, Reservoirs, Water wells, Water levels, Sampling, Sites, Tidal streams.
Identifiers: Annual State report(NY).

Water resources data for the 1975 water year for New York State include records of surface water, water quality, and ground water. The surface-water section contains discharge data for 209 gaging stations, stage-content data for 39 lake and reservoir stations, and stage-only data for 31 stations (6 of which are tidal stations). Also included are discharge data for 174 partial-record stations (86 crest-stage and 88 low-flow stations) and 199 miscellaneous sites. The water-quality section contains chemical, temperature, and suspended-sediment data on surface water for 151 stations, 81 partial-record stations, and 113 miscellaneous sites, as well as chemical data for 233 groundwater miscellaneous sites and 10 precipitation-quality stations. Water-level data are included for 42 long-term observation wells. (Woodard-USGS)

CONSTRUCTION AND MAINTENANCE COSTS OF SEWER SYSTEMS (BAU- UND BETRIEBSKOSTEN VON KANALISATIONSANLAGEN),
H. Haendel.
Berichte der Abwassertechnischen Vereinigung, e.V., No 29, p 205-219, 1976. 9 tab.

Descriptors: *Sewers, *Construction costs, *Maintenance costs, *Operating costs, Topography, Soil types, Population, Density, Groundwater, Construction materials, Climates, Piping, Earthworks, Cost analysis.

Construction, operating, and maintenance costs of sewer systems are discussed. The construction costs are influenced by such factors as topographic conditions, population density, type of ground, groundwater level, weather conditions, type and price of the pipes and other installations. Charts are presented for the determination of the specific costs of earthworks and piping. The high construction costs fully justify the use of high-quality, more or less expensive pipes to increase the life of the sewer system. (Takacs-FIRL)

DESIGN AND OPERATION OF RAIN RETENTION BASINS (ENTWURF UND BETRIEB VON REGENRUCKHALTEBECKEN),
E. Malpricht.
Berichte der Abwassertechnischen Vereinigung e. V., No 29, p 147-162, 1976. 12 fig, 6 ref.

Descriptors: *Water storage, *Basins, *Design criteria, *Storm runoff, *Model studies, Sewers, Canals, Construction, Canal construction, Engineering, Flow, Operations.
Identifiers: *Rain retention basins.

Design calculations and operation of rain retention basins are described. The value of the design rainfall frequency can be reduced for canals having a small slope within the sewer system. The feed canal should be as high as possible to prevent settling. The longitudinal slope of the retention basin should not be greater than 0.5%; the transversal slope should be 3-5%. The dry-weather runoff can pass through the retention basin. The calculation of rainwater retention basins according to Specification A 117 is described. (Takacs-FIRL)

THE EFFECT OF AERATION OF WATER JET SPREADING,
Connecticut Univ., Storrs. Inst. of Water Resources.
A. H. Hsia.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-267 717, Price codes: A12 in paper copy, A01 in microfiche. Ph.D. Dissertation, 1977. 236 p, 4 tab, 77 fig, 56 ref, 3 append. OWRT A-050-CONN(5). 14-31-0001-3507.

Descriptors: *Jets, *Aeration, *Hydrodynamics, *Flow characteristics, *Turbulent flow, Discharge(Water), Cooling water, Thermal pollution.
Identifiers: *Aerated turbulent jet flow, *Water jet behavior, *Axisymmetric jets, *Planar aerated jets, *Jet trajectory.

Theoretical and experimental studies were made on jet characteristics when a large number of small air bubbles (.050 to .080 in. dia) were injected into the submerged water jet to form a two phase flow. In the experimental studies for both axisymmetric and planar aerated jets, initial jet velocity was varied from 1.39 to 9.23 ft/sec, initial air to mixture void fraction from 0 to .495, initial temperature difference between the jet and its ambient from 0 to 34.2 C, and for the aerated planar jet tests, submergence from 4.9 to 14.9 in. Respective influences from these parameters on jet behavior were investigated. The dependent variables measured included jet trajectory, local jet diameter or thickness for a planar jet, and centerline temperature decay. The theoretical analyses for both axisymmetric and planar aerated jets were based on a separated-flow model in which fundamental equations characterizing each phase of the air-water mixture were included. The system of dif-

ferential equations was solved numerically and yielded predictions in agreement with the experimental data. Aeration was an effective means for bringing the jet to the free water surface, and the extent of aeration influence on jet path was a function of both initial velocity and void fraction. The discharge submergence was influential in determining planar jet dividing streamline path. Faster centerline temperature decay due to aeration was only detected in vertical axisymmetric jets. ALTERNATIVE MEASURES OF RIVER CHANNEL SHAPE AND THEIR SIGNIFICANCE,
Papua and New Guinea Univ., Port Moresby (New Guinea). Dept. of Geography.
G. Pickup.
Journal of Hydrology (New Zealand), Vol. 15, No. 1, p 9-16, 1976. 3 fig, 11 ref.

Descriptors: *Rivers, *Shape, *Open channels, Channels, Hydraulics, Dimensions, Size, Width, Water levels, Depth, River beds, Foreign research, Foreign countries.
Identifiers: *New Guinea, Hydraulic geometry.

The width/depth ratio is not always the best measure of river channel shape because it is measured only at the bankfull stage. Therefore, the width/depth ratio is insensitive to some types of shape difference and as a result may not reflect the effect of variations in sediment characteristics. Two alternative measures were proposed: bed width, and the exponent x in the equation Wi = c(D to the x power), where Wi is width at stage D. In Cumberland Basin stream channels, bed width increases with mean size of the bed material, while x decreases, reflecting shape adjustment to increasing bed-load transportation. (Humphreys-ISWS)

A FINITE ELEMENT MODEL TO DETERMINE THE EFFECT OF LAND-USE CHANGES ON FLOOD HYDROGRAPHS,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Civil Engineering.
B. B. Ross.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-268 246, Price codes: A07 in paper copy, A01 in microfiche. MS Thesis, November 1975. 117 p, 10 tab, 20 fig, 48 ref, 4 append. OWRT A-062-VA(1).

Descriptors: *Land use, Floods, Hydrograph analysis, *Finite element analysis, Computer models, Model studies, Channel flow, Overland flow, *Mathematical models, *Virginia, Watersheds(Basins).
Identifiers: Finite element model, Galerkin's residual method, *South River watershed(Va).

The finite element theory, in conjunction with Galerkin's residual method, was used to mathematically route overland and channel flow. This numrical procedure was applied to the kinematic equations of one-dimensional transient flow in open channels. A one-dimensional finite element scheme was used to simulate overland flow over the watershed and open channel flow in the main stream, after a finite element grid had been devised for both the watershed and the streams. Rainfall excess, the major input parameter, was obtained as a function of rainfall, depending on soil properties and existing land-use conditions across the watershed. The model was tested and calibrated on a natural watershed. The nature of the finite element procedure allowed changes in land-use to be easily incorporated into the model. The effect of several arbitrary land-use changes upon the response of the river under flood conditions was observed. The effect of changes in the number and size of the elements in the watershed and the streams was also observed along with changes in the size of the time increment.

PUMPED STORAGE POTENTIAL OF THE HELLS CANYON AREA,
Idaho Univ., Moscow. Dept. of Civil Engineering.
L. D. Coupe.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-267 722, Price codes: A07 in paper copy, A01 in microfiche. Master of Science Thesis, April 1977. 132 p, 35 fig, 7 tab, 28 ref, append. OWRT B-037-IDA(1). 14-31-0001-5070.

Descriptors: *Pumped storage, Electric power, *Hydroelectric plants, *Reservoir operations, Water level fluctuations, Economics, Feasibility, Feasibility studies, Social values, *Environmental effects, Peak discharge, Nuclear powerplants, National recreation areas, Idaho, Oregon, *Sites.
Identifiers: *Hells Canyon, Hells Canyon Dam, Snake River, Barber Flat, Bear Creek.

The potential for pumped storage hydroelectric development of the Hells Canyon area is reviewed, with conclusions drawn from preliminary investigation. Background information covers the concept and application of pumped storage, Hells Canyon's physical characteristics and history and its status as a National Recreation Area. Of eighteen potential storage sites noted, the three most promising are analyzed in detail. For each, preliminary designs have been developed as well as computer analyses of the reservoir water level fluctuations that would result from such operations. Each is also analyzed for economic feasibility. Conclusions are that pumped storage in the area is too expensive to be competititve now, but it may be more feasible in the future. Possible major environmental and social effects are noted; the sites are compared, and one (Barber Flat, Idaho) is recommended for further consideration. Alternative uses of pumped storage in Hells Canyon are (1) to relieve Hells Canyon Dam of objectionable peaking, (2) to cool a nuclear power plant. For the latter, Bear Creek No. 1 is recommended for further study.

KELLY CARE EXTENDS SERVICE LIFE,
Drilco, Houston, Tex.
D. W. Brinegar.
Oil and Gas Journal, Vol. 75, No. 18, p 267-278, May 2, 1977. 5 fig, 4 tab, 5 ref.

Descriptors: *Rotary drilling, *Drilling equipment, *Maintenance, Fatigue(Mechanics), Failures(Mechanics).
Identifiers: *Drill kellys, Drive assemblies.

Kellys, the transmission link between the surface power of the rig and the drill bit, are meeting increasing demands as drilling and drilling technology evolve. The Kelly's ability to perform over a long period depends largely on control of normal wear and keeping clearance between Kelly flats and the drive roller assembly at a minimum. Aside from thread damage, Kellys fail as a result of becoming crooked or bent, from fatigue at certain

key points, or from excessive rounding of drive corners. Proper attention to handling and to the relationship between normal wear or both Kelly and drive assembly will do much to help prolong kelly life. Reversing ends and remilling are two methods of repairing a worn kelly, provided that the repairs are done before excessive and irreversible damage is sustained. (Eberle-NWWA)

AIR, MIST AND FOAM DRILLING, A LOOK AT THE LATEST TECHNIQUES, PART 2,
R. A. Hook, L. W. Cooper, and B. R. Payne.
World Oil, Vol. 184, No. 6, p 83-90, May, 1977. 3 fig, 4 ref.

Descriptors: *Rotary drilling, *Drilling equipment, *Drilling fluids, Foaming, Wells, Oil wells, Burning, Aeration.
Identifiers: *Air-rotary drilling, *Mist and foam drilling, *Aerated fluid drilling, Drill collars, Air-percussion hammers, Drill string wear, Stuck pipe, Downhole fires and explosions.

The single most important factor in air and mist drilling is the volume of air used. 2000 to 2400 cubic feet per minute (through 41/2 inch drill pipe in a 7 7/8 inch hole) is adequate for most air drilling situations. Mist drilling requires 30 to 40% more air, with pressures of 200-400 psig as compared to 100-300 psig for air alone. When a water-bearing formation is encountered, air drilling becomes impossible and a mist of water plus soap must be employed. Should the volume of water entering the bore become too great, even mist may have to be abandoned and aerated drilling mud utilized instead. Hole deviation can become a serious problem in any drilling operation, but can be minimized in air/mist drilling with the use of square drill collars, stabilizers, and reamers. All help prevent bending and binding of the drill string. Air-percussion hammers are also helpful in maintaining a straight hole, because they require relatively little bit weight. Proper care and drilling technique can make air/mist drilling an economical method, but constant, close supervision is essential for preventing such problems as stuck drill strings and expensive fishing operations. (Eberle-NWWA)

RESEARCH INTO THE IMPACT ON ELECTRICAL EQUIPMENT FROM VARIABLE SPEED OPERATION OF PUMPED-STORAGE PLANTS,
General Electric Co., Schenectady, N.Y. Electronic Power Conditioning and Control Lab.
T. A. Lipo.
Final Report (SRD-77-063), April 8, 1977. 172 p, 99 fig, 24 tab, 3 append. Bur Reclam 6-07-DR-50090.

Descriptors: *Electrical equipment, *Pumped storage, *Operation, *Performance, *Power system operation, *Electrical design, *Electric generator, *Power transformers, Electric switches, Electric relays, Switch gear, *Electric converters.
Identifiers: *Variable speed operation(Pumped - storage plants).

Work was conducted to determine the effect of operating electrical equipment of pumped-storage plants over a variable frequency range of 30 to 81 Hz. The motivating factor behind the study was the desire to improve pumped-storage hydro efficiency. The reversible Francis type pump-turbine represents a compromise design to achieve a best overall efficiency at constant speed for a particular head. The variable speed concept would allow speed to change with head variations while maintaining optimum pump-turbine efficiency over the entire head range. The electrical equipment considered includes the generator/motor, excitation equipment, switchgear and bus, metering, surge protection, relaying, and power transformer. Converter harmonics and the converter effect on system power factor are analyzed for the generator/motor. A simulation study was conducted on a hybrid computer to identify potential system problems which arise from variable speed operation. (Bur Reclam)

SEWAGE PUMPING STATION BUILT TO HANDLE FUTURE SYSTEM DEMANDS,
Topeka Water Pollution Control Dept. Kans.
J. D. Glidewell, Jr.
Water and Sewage Works, Vol 124, No 4, p 105-106, April, 1977.

Descriptors: *Pumping plants, *Pumps, *Design criteria, Planning, Engineering structures, Cities, Sewage treatment, Automatic controls, Maintenance, Performance, Operations, Waste water treatment, Kansas.
Identifiers: Topeka(KS).

A pumping station of 'concentric cylinder' design was constructed in Topeka, Kansas. The automated station, with computer monitoring, houses variable speed pump and motor combinations which are designed to meet normal growth demands. The system included a 44 foot deep, 22 foot diameter center wet well for sewage which first passes through bar screens. Two variable speed solids-handling pumps have a 21 mgd capacity, and the third has a 14 mgd rating. A 50 mgd design capacity was built into the system. The pumps have mixed-flow sewage-type closed impellers to aid handling of large solids and stringy materials. (Collins-FIRL)

ANALYSES OF WATER, CORE MATERIAL, AND ELUTRIATE SAMPLES COLLECTED NEAR NEW ORLEANS, LOUISIANA (LAKE PONTCHARTRAIN, LOUISIANA, AND VICINITY HURRICANE PROTECTION PROJECT),
Geological Survey, Baton Rouge, La. Water Resources Div.
H. L. Leone, Jr.
Open-File Report 76-758, October 1976. 22 p, 4 fig, 11 tab, 7 ref.

Descriptors: *Flood protection, *Levees, *Design criteria, *Core drilling, *Water quality control, Water analysis, Sediments, Chemical analysis, Construction, Planning, Hurricanes, Tides, Estuaries, Floods.
Identifiers: *Lake Pontchartrain area(La), Preconstruction data.

When a hurricane approaches the New Orleans, Louisiana area, the accompanying tides and heavy rainfall increase the level of water in Lake Borgne, Mississippi Sound, and Lake Pontchartrain and pose a major threat of water damage to the populated areas. During Hurricane Betsy (1965), for example, the level of Lake Pontchartrain rose as much as 13 feet. Nineteen core-material-sampling sites were chosen by the U.S. Army Corps of Engineers as possible borrow areas for fill material to be used in levee construction for flood protection around Lake Pontchartrain. Twenty-three receiving-water sites were also selected to represent the water that will contact the proposed levees. Selected nutrients, metals, pesticides, and other organic constituents were analyzed from bed-material and native-water samples as well as upon elutriate samples of specific core material-receiving water systems. The results of these analyses are presented without interpretation. (Woodard-USGS)

CHANNELIZATION: ENVIRONMENTAL, GEOMORPHIC AND ENGINEERING ASPECTS,
North Carolina Univ. at Charlotte. Dept. of Geography and Earth Science.
E. A. Keller.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-268 051, Price codes: A06 in paper copy, A01 in microfiche.
Reprint of paper to appear in: Geomorphology and Engineering, 1976 ed. by D. R. Coates. Dowden, Hutchinson & Ross, Inc., 52 p. 21 fig., 24 ref. OWRT B-089-NC (1).

Descriptors: *Channel improvement, *Geomorphology, *Hydrology, *Channel morphology, *Design, *Design criteria, Channel design, Streams, Channel erosion, Fluvial sediment, Urban hydrology, Bank erosion, Alluvial channels, Shape, Slopes, Width.
Identifiers: Channelization, Fluvial processes, Rural streams, Urban streams.

The behavior of alluvial streams is not well understood. Therefore, until more information concerning relations between fluvial processes channel form and biologic systems in streams is available for application to channel design it is recommended that channelization should be minimized and the minimum control provided to obtain the desired (or modified) objectives. Several concepts of fluvial geomorphology and fluvial hydrology that are now or eventually may be useful in designing channels are: (1) streams are open systems in which channel form and process evolve in harmony; (2) convergence and divergence of flow is associated with scour and deposition of sediment; (3) geomorphic thresholds or feedback in open systems may be inherent in the processes of erosion and in change of channel pattern; and (4) relations between erosion, deposition and sediment concentration have an important role in determining the morphologic stability of a stream channel. Engineering trends in channelization are away from the uniform straight channel with uniform channel cross section and gradient and are moving toward construction of more natural appearing streams. CHEMICAL AND VEGETATIVE STABILIZATION OF SOILS,
Bureau of Reclamation, Denver, Colo. Engineering and Research Center.
W. R. Morrison, and L. R. Simmons.
Report No. REC-ERC-76-13, January 1977. 161 p, 50 fig, 27 tab, 293 ref.

Descriptors: Soil erosion, Soil stability, *Soil stabilization, Soil surfaces, Soil treatment, *Chemical sealants, Vegetation establishment, *Erosion control, Asphalts, *Slope protection, Roads, Revegetation.
Identifiers: Wellton-Mohawk Canal, Fort Thompson Substation, Mt. Elbert Pumped-Storage Powerplant, Mulches, Polyvinyl acetate.

A study was conducted on various chemical and vegetative methods of soil stabilization for possible use in the USBR's construction and O and M programs. Three main items of work accomplished under the study are summarized: (1) Laboratory Studies. -- (a) Screening tests conducted on 30 liquid soil stabilizing materials. Based on the results, tentative performance requirements were

developed for water-based soil stabilizers. (b) Special studies conducted on materials and methods to waterproof problem soils, to arrest erosion occurring on slopes, and to bind gravel together for riprap applications. (2) Field Applications. -- Discussions on where various chemical and vegetative methods have been used in new construction, rehabilitation, or O and M work. (3) State-of-the-Art Survey. -- A survey on chemical stabilization of soils, and revegetation methods and materials for erosion control. Results indicate that through chemical and vegetative stabilization of disturbed soils, sediment production can be reduced, fertile top soil preserved, and a more environmentally acceptable condition achieved after construction is completed. AN EARTHQUAKE RISK MODEL THAT INCORPORATES LOCAL NEAR SURFACE SITE CONDITIONS,
California Univ., Los Angeles. School of Engineering and Applied Science.
R. T. Eguchi.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-268 050, Price codes: A07 in paper copy, A01 in microfiche. Report UCLA-ENG-7547, June 1975. 117 p, 15 fig, 4 tab, 42 ref. (California Water Resources Center Project UCAL-WRC-W-339). OWRT B-159-CAL(2).

Descriptors: *Earthquakes, *Earthquake engineering, *Model studies, *California, *Risks, *Sites, Attenuation, Estimating, Forecasting, Velocity, Methodology.
Identifiers: *Los Angeles(Calif), *Modified Mercalli Intensity, *Particle velocity.

An earthquake risk model that incorporates local near surface site conditions was developed and applied to the Los Angeles area. In the model, the occurrence of earthquakes in time, magnitude and space are represented by probability distributions which have been developed by others. However, the particular joint distribution of the three was developed here. The estimation of risk is expressed in terms of two ground motion indices, Modified Mercalli Intensity and maximum particle velocity. Special emphasis is given to establishing the effect of local site geology on the estimation of risk. Local site factors for intensity have been adopted from the work estimation of risk. Local site factors for intensity have been adopted from the work of others, while site factors for maximum particle velocity were developed. The site factors for maximum particle velocity required the establishment of a near surface model, which was developed. 1971 San Fernando earthquake data are utilized to develop attenuation relationships for maximum particle velocity and Modified Mercalli Intensity. The effects of including and excluding aftershocks on the probabilities were observed. Five examples are presented, three in terms of Modified Mercalli Intensity and two in terms of maximum particle velocity. Comparisons are made among the examples. A general discussion of the limitations and merits of the methods used is presented. (Snyder-California, Davis)

POST-TENSIONED SEWER RIVER CROSSING.
New Zealand Engineering, Vol. 32, No. 2, p 42, February, 1977.

Descriptors: *Sewers, *Construction, *Engineering structures, Hydraulic structures, Pipelines, Pumping plants, Equipment, Excavation, Design criteria, Flow, Monitoring.
Identifiers: Hutt River(New Zealand).

A major part of the main sewer drainage of the Hutt Valley, New Zealand, was recently duplicated. This project included an on-grade sewer crossing of the Hutt River at Silverstream. Previous sewers crossing the river were true siphons or pumping mains, which entailed continuous operating costs and potential pollution hazards. The availability of bedrock close to the stream bed surface was confirmed. Because of a fault zone in the area, it was decided to make the 165 meters long crossing and the manholes monolithic by post tensioning. A tidy slab with a reinforced shear key was poured on the excavated rock surface. The pipe structure was post-tensioned with eighteen multistrand cables with five vertical anchors stressed to 70 t to anchor the crossing to the bedrock. Sewage flow is carried by two 1065 millimeters diameter pipes. Design capacity is 10,900 cubic meters/hour. Overflow pipes and service ducts were included in the construction, with a river level recording channel and a modified Parshall flume to monitor total sewage flows of the Upper Hutt basin. (Collins-FIRL)

RESEARCH ON CEMENTS FOR GEOTHERMAL AND DEEP OIL WELLS,
Colorado School of Mines, Golden.
G. L. Kalousek, and S. Y. Chaw.
Society of Petroleum Engineers Journal, Vol. 16, No. 6, p 307-309, December, 1976. 1 fig, 2 ref.

Descriptors: *Cements, *Thermal properties, *Deep wells, Laboratory tests, *Oil wells, Geothermal studies.
Identifiers: *Calcium silicate cements.

Strength problems frequently occur in cements used in hot wells, and appear to become worse as temperature and bottom-hole pressure increase. This study investigated the relationship between cement strength versus Ca0/Si02 ratios and the amount of A1203 in cement mixtures. The optimum composition for cement among the substances tested in the study was a proportion of 5 Ca0 : 6 Si02 plus 7% A1203, yielding a tobermorite binder stable to 250 degrees C. A 2 Ca0 : 3 Si02 composition with additions of 5% A1203 also yielded an apparently stable product when autoclaved at 300 degrees C for 10 days. Alumina available to the binder and depending on the amount had a spectrum of effects ranging from highly beneficial to highly deleterious. Particular attention is directed to the need of differentiation between stable and meta-stable products in future research. (Eberle-NWWA)

CEMENTING OIL AND GAS WELLS, PART 2 - CASING INSPECTION AND PIPE HANDLING METHODS, INCLUDING THREAD MAKE-UP CONTROL,
Completion Technology Co., Houston, Tex.
G. O. Suman, Jr., and R. C. Ellis.
World Oil, Vol. 184, No. 5, p 69-76, April, 1977. 8 fig, 4 tab, 20 ref.

Descriptors: *Well casings, *Steel pipes, *Damages, *Inspection, Cement grouting, Nondestructive testing, Oil wells, Electronic equipment, Joints(Connections), Specifications.
Identifiers: *Well casing make-up, Torque, Axial load, Power tongs, Pipe threads, Pipe thread compounds, Rig floor leak tests, Casing landing practices.

Higher equipment and service costs emphasize the need for strict attention to casing quality control and handling before cementing. Many casing probelms are directly related to conditions prior to cementing. Many casing problems are directly related to conditions prior to cementing such as: metallurgical flaws, damage in transit or on location, improper make-up, or poor Sunning practices. Casing inspection can be performed by various visual and electronic means. Although fairly tight quality control is maintained at the mill, well site testing of tubular goods is suggested as a way of detecting transport and handling damage. The contractor himself can minimize handling damage by transporting casing only when thread protectors are in place, and by making sure that all equipment used in running casing is appropriate for the job and in good working order. Torque should not be the exclusive criterion for testing proper joint make-up. Make-up position should be visually inspected as a double check. (See also W77-08328) (Eberle-NWWA)
W77-08327

CEMENTING OIL AND GAS WELLS, PART 3,
Completion Technology Co., Houston, Tex.
G. O. Suman, Jr., and R. C. Ellis.
World Oil, Vol. 184, No. 6, p 48-57, May, 1977. 11 fig, 5 tab, 36 ref.

Descriptors: *Cements, *Cement grouting, *Drilling fluids, *Additives, Bentonite, Portland cements, Pozzolans, Slurries, Strength of materials, Oil wells.
Identifiers: *Cement classifications(API), Thickening time, Lost circulation, Specialty cements.

Cement slurry composition can be tailored to meet the demands of nearly every modern well completion by carefully selecting the correct class of cement, the proper additives, and judging the correct volume of water to be mixed in. Important factors to be considered in well cementing are depth and downhole temperature, potential for fluid loss, time parameters, and of course, cost. Additives can be used to both increase and retard setting time, to change viscosity and permeability, vary density, reduce friction, control lost circulation, introduce gelling properties, and to ensure the cement will perform well in hostile completion environments. This article lists types and classes of cement and additives, details their chemical action, and suggests application to specific drilling situations. Properties of set cement are presented both in the text and in graphic form, and space is devoted to a brief discussion of special cements. (See also W77-08327) (Eberle-NWWA)
W77-08328

CONCRETE BUCKET DISTRIBUTES CRUSHED BEDDING EVENLY ON SEWER JOB.
Highway and Heavy Construction, Vol. 120, No. 4, p 32-33, April, 1977.

Descriptors: *Sewers, *Concrete construction, Construction materials, Excavation, Concrete, Conveyance structures, Conduits, Piping, Clay pipes, Plastics.
Identifiers: Concrete bucket.

A bottom-dump concrete bucket was used to distribute granular bedding for a sanitary sewer line. The work was done quickly and easily in otherwise inaccessible areas. Excavation of sandy, red clay soil in Dothan, Alabama, was done with an hydraulic backhoe with a 1 1/2 cubic yard bucket. Clay and PVC pipe were used for the project which required 23,000 linear feet of sewer line and 14,000 linear feet of water pipe. The terrain ranged rom open prairie to wooded with a creek. An eighteen-foot deep cut was planned near the creek. A right work area was created because many old trees could not be removed. A track loader with a bucket was used to carry granular material from the stockpile to the concrete bucket. The concrete bucket was attached to the backhoe bucket and lowered into a trench after backhoe excavation. The bucket dropped an even 12 inches of crushed bedding into the trench. After pipe connections were made, backfill operation was begun. A compactor was used to consolidate the upper 12 inches

of backfill to a 100% modified Proctor. (Collins-FIRL)

BETTER PROTECTION FOR CASING AND TOOL JOINTS,
Reed Tool Co., Houston, Tex.
A. E. Gooch.
Drilling-DCW, Vol. 38, No. 8, p 93-96, May, 1977. 1 fig, 3 ref.

Descriptors: *Rotary drilling, *Well casings, *Drilling equipment, Steel pipes, Joints(Connections).
Identifiers: *Tool joint hard facings, *Casing wear.

Casing wear, a problem that has plagued rotary drillers for decades, is caused by friction between casing and the hard-faced surfaces on the outside diameter of tool joints. Casing wear can contribute to many serious and costly well problems, however, drill string wear would pose equally costly problems if hard-facing were not used on the joints. The dilemma now seems to have been solved by a two-step surfacing process. 14-20 mesh sintered tungsten carbide pelletized surfacing is first applied to the OD of the tool joint, then a thin layer of alloy steel is applied over the tungsten carbide. The result is a bearing-type hard surface that significantly reduces abrasion and galling of casing, yet wears very little itself. In tests against various ferrous and nonferrous facing, this dual combination showed much better performance than commonly available joint wear protection materials. (Eberle-NWWA)
W77-08315

RESIN-COATED GRAVEL IS USED TO HELP CONTROL SAND,
Maurer Eng. Inc., Houston, Tex.
A. R. Sinclair, and J. W. Graham.
Oil and Gas Journal, Vol. 75, No. 16, p 58-60, April 18, 1977. 5 fig, 2 ref.

Descriptors: *Gravels, *Resins, *Well filters, Oil wells.
Identifiers: *Gravel packing, *Phenolic resins, Sand control.

High strength-high permeability gravel packs can now be obtained with a special resin-coated gravel. Regular sand or gravel is thinly coated with thermosetting phenolic resins which sets up in formations with temperature above 130 degrees F. Not only does the material remain highly porous, but the resin coating bears part of any load placed on the sand. The special gravel handles like any ordinary dry gravel in field use; long-term strength after setting up seems satisfactory. In several experimental applications, the resin-coated material significantly improved the performance of oil wells which chronically pumped sand. Occasional failures occurred when insufficient material was placed in the well or when parts of the formation remained untreated. (Eberle-NWWA)

IT'S YOUR LOSS,
R. B. McDannald.
Water Well Journal, Vol. 31, No. 5, p 34-35, May, 1977. 9 tab.

Descriptors: *Pumps, *Fluid friction, Pumping, Flow characteristics, Plastic pipes, Pipes.
Identifiers: *Friction loss, Submersible pumps.

Unless a well or pump contractor pays close attention to the piping in a new water system, he runs the risk that friction loss will drastically reduce the output of an otherwise adequate pump. The following relationships should always be kept in mind when designing an individual water system: (1) the longer the pipe coming from the pump, the greater the friction loss (2) the smaller the pipe, the greater the friction loss (3) the greater the flow, the greater the friction loss (4) deposit build-up on the indside walls of the pipe can increase friction loss two or three times (5) tees, ells, and check valves contribute to friction loss (6) generally, plastic pipe has less friction loss than metal pipe of equivalent size, and also less chance of deposit build-up. Friction loss charts are an invaluable aid to the contractor. In addition, many pump manufacturers list friction loss for check valves in their pump specifications. (Eberle-NWWA)

POLYETHYLENE SEWER FORCE MAIN TAKES VARYING PRESSURES.
Water and Sewage Works, Vol 124, No 4, p 108-110, April, 1977. 1 fig.

Descriptors: *Sewers, *Construction, *Plastics, Planning, Pipes, Physical properties, Construction materials, Pumps, Costs, Hydraulic structures.

A 16,640-foot, 14-inch polyethylene sewer force main has been constructed in Ruston, Louisiana. This is part of the first of a three stage project to rehabilitate the city's treatment system. The force main is subjected to pressures of up to 100 psi. The pipe was formed by butt fusing of the joints to provide resistance to railway vibration; it is also elastic and able to withstand deflection. The Driscopipe 1000 chosen has a high molecular weight and is suited for sewer use due to its stress crack resistance, stiffness, and toughness. Variable speed pumps will be used to minimize shock wave production when pressure is increased or dropped. A pressure profile was used and pipe thicknesses were chosen to match pressure at various points along the line. This resulted in a material and cost savings of nearly 15%. Hydraulic backfilling of the ditches eliminated the need for a man in the ditch after pipe laying. (Collins-FIRL)
W77-08549

THE PROTECTION AND REPAIR OF UNDERGROUND PIPELINES FOR WATER AND SEWAGE,
M. S. Leng.
Water Services, Vol 82, No 973, p 168, 171, March, 1977.

Descriptors: *Pipelines, Metal pipes, Concrete pipes, Oxidation, Corrosion, Conveyance structures, Resins, Linings, *Sewers, Chemical reactions, Corrosion control, Physical properties, Chemical properties, Hydraulic structures.

The protection and repair of underground pipelines of ferrous metals, asbestos cement, and various concretes is very important. Metal pipes are subject to various chemical reactions, such as oxidation, which causes them to revert to their original ores, and corrosion from the elements in raw sewage. Coatings of various types and cathodic protection are used to protect ferrous metal pipes. Various polymer resins are used for cement and concrete pipes. These pipes require protection primarily from sulfuric acid, acidic water and groundwater, and chemicals from industrial sources. Special equipment is available for sealing defective joints. Pipe repairs may be needed to stop excessive infiltration, protect pipes from interior chemical attack, correct damage already done, or to strengthen pipelines. Repair is expensive, but reconstruction is much more costly. (Collins-FIRL)
W77-08551

PLAIN-END PIPE 'COLLARS' PROBLEM SEWER CONNECTIONS,
W. S. Foster.
The American City and County, Vol. 92, No. 4, p 76, April, 1977.

Descriptors: *Piping, *Sewers, *Joints(Connections), Clay pipes, Plastics, Infiltration, Costs, Physical properties, Chemical properties, Construction materials.
Identifiers: Plain-end pipes.

Plain-end pipe, which has a factory-applied polyvinyl chloride or fiber-glass-reinforced polyester plastic collar, may permit reductions of installation costs in sewer collection systems. The collar is molded to provide a double bead and ensure an infiltration-tight seal; the spigot end is provided with a flexible molded band, generally of urethane rubber. The bells of flared-end pipes represented the most common site of breakage in the past. Trench excavation and pipe bedding had to be very carefully executed to provide safe and proper support for these pipes. Clay pipe has many desirable properties, but the cold mastic or cement mortar previously used to join them were not sufficiently resistant to movement or infiltration. Jointing systems for clay pipes are now improved. Many suppliers of bell-and-spigot type pipes expect to offer plain-end pipe in the future, and some suppliers of plain-end pipe are listed. (Collins-FIRL)
W77-08553

IDEAS APLENTY-BUT STILL SEWERS FACE CASH NEGLECT.
Surveyor, Vol. 149, No. 4425, p 14-15, April, 1977.

Descriptors: *Sewers, *Maintenance, *Repair, *Construction, Economics, Planning, Costs, Construction materials, Tunneling, Flow, Measurement, Polymers, Corrosion control, Cleaning, Inspection.

Proposals from Great Britain's Water Research Centre conference on Opportunities for Innovations in Sewerage are reported. The lack of progress towards innovation in the British sewerage industry was blamed not upon a lack of

ideas, but on shortages in funding. British sewer systems are greatly in need of repair. A four-point plan was outlined for improvements, involving: identification of work priorities; use of existing techniques to increase sewer life; development of new technology where applicable; and increasing the efficiency and cost-effectiveness of full reconstruction techniques. The five sections of the conference focused upon planning and design, construction and records, flow measurement and control, inflow and infiltration and maintenance and renovation. New synthetic materials for sewerage were suggested as replacements for traditional ones. These plastics provide high reliability and durability in drainage systems, rising mains, and gravity and trunk sewers. It was recommended that upgrading of sewerage systems be implemented, using available and new technologies, in order to counteract the effects of years of neglect on these systems. (Collins-FIRL)
W77-08554

PERFORATED, VITRIFIED CLAY PIPE USED IN PEORIA FACILITIES,
Water and Wastes Engineering, Vol. 14, No. 4, p 85, April, 1977.

Descriptors: *Clay pipe, *Treatment facilities, Pumping plants, Excavation, Lagoons, *Sludge treatment, Drying, Evaporation, Dewatering, Sludge disposal, Soil amendments, *Waste water treatment, *Pipes.

East Peroria, Illinois, had used 54,000 feet of 4 inch, perforated vitrified clay pipe (VCP) in constructing eight sludge lagoons and a supernatant pumping station. The lagoon acreage was decreased by two feet. Eight foot dikes were built around each lagoon. Trenches 2 feet deep and 1 foot wide were dug 60 feet apart. The trench base was a 6 inch bed of well-graded gravel and the pipe was covered by 6 inches of gravel and 16 inches of well-graded sand. The lagoons were convered with pea gravel. They will be charged sequentially; the maximum accumulation of sludge in each lagoon will be 2 feet. A 1 year period will elapse before the organic soil is sufficiently dry to be scraped off and stored in an adjacent area. Experimental lagoons were used to determine the spacing and depth of pipe placement. It was found that a 2 foot depth would protect pipes from damage when machinery removed the organic soil. Influent is pumped into the lagoons and the supernatant is pumped to the river upstream from the plant. The influent is treated, and the clean water is discharged into the river. The system handles nearly 30 mdg, but is expected to treat 154 mdg after completion. There is no odor problem. The 5% solids which remain after lagoon treatment is called an organic soil stabilizer. It will be produced at an annual rate of 9 to 10,000 dry tons. (Collins-FIRL)

MARINE LIFE PROTECTOR,
E. Daidola, and J. C. Daidola.
U.S. Patent No. 3,996,138, 10 p, 6 fig, 18 ref; Official Gazette of the United States Patent Office, Vol 953, no 1, p 284, December 7, 1976.

Descriptors: *Patents, *Intakes, Structures, Orifices, Engineering structures, Protection, Aquatic life.

A device for protecting marine life from water intake ducts is presented. The intake duct enters the marine life protector which is characterized as an inner body of water separated from the main outer body of water by means of barrier walls. Through one or more of these barrier walls, input ducts are arranged which pass through the barrier walls having their longitudinal axes other than parallel to the free surface of the water bodies so that the input and exit orifices of the ducts are at different water levels. At least one of these orifices may be covered with a grating or screening or other additional protective means. (Sinha-OEIS)

SUBJECT INDEX

ABORIGINAL WATER RIGHTS
The Winters Doctrine and How It Grew: Federal Reservation of Rights to Use of Water,
W77-08375 6E

ABSOLUTE LIABILITY
From Good Husbandry to Reasonable Use: Illinois Surface Water Drainage Law Evolves in Subdivision Case,
W77-08353 4A

Liability for Damages to Adjacent Land or Building Caused by Dredging,
W77-08387 6E

ABSORPTION
Organochlorine Residues in New Zealand Birds and Mammals 2. Polychlorinated Biphenyls,
W77-08210 5C

Biochemical Transformation and Detoxification of Mercury in Aquatic Environment,
W77-08289 5C

Measurement of the Attenuation of Electromagnetic Radiation by Water in the Visible Region of the Spectrum,
W77-08293 1A

Mercury Accumulation in Trout of Southern Missouri,
W77-08304 5C

ACCIDENTS
Canadian Pacific (Bermuda) Limited V United States (No Duty to Survey or Dredge Channel at Any Particular Time).
W77-08152 6E

ACCRETION (LEGAL ASPECTS)
State v. Matzen (Use of Historical Maps to Settle Claims to Accretion Lands).
W77-08139 6E

Riparian Owner's Right to New Land Created by Reliction or by Accretion Influenced by Artificial Condition Not Produced by Such Owner.
W77-08398 6E

ACHNANTHES-MINUTISSIMA
The Productivity of Fouling Organism Associations in Lake Zelenetskoe, (In Russian),
W77-08323 5C

ACID PRECIPITATION
The Utility of Paleolimnological Analyses of Lake Sediments for Evaluating Acid Precipitation Effects on Dilute Lakes,
W77-08103 5A

ACIDITY
Root Growth, Strength, and Chemical Properties of a Hobson Fragipan,
W77-08285 2G

ACIDS
Fulvic Acid-Metal Ion Interactions in Water,
W77-08102 5A

ACTIVATED CARBON
What Lies Ahead for PAC,
W77-08541 5D

ACTIVATED SLUDGE
Effect of Acclimation to Lime-Sulfide Effluent from Unhairing Cattlehides on the Composition of Activated Sludge,
W77-08279 5D

Bacterial Growth Kinetics in the Completely Mixed Activated Sludge Treatment of Fellmongery Effluent,
W77-08281 5D

Process Design of Single-Sludge Activated Sludge Systems Using Nitrate Respiration,
W77-08336 5D

Full Scale Operation of Plug Flow Activated Sludge Systems,
W77-08451 5D

Improved Galvanic Dissolved Oxygen Sensor for Activated Sludge,
W77-08539 5A

Use of Oxygen in Activated Sludge Plants (Utilizzazione dell'ossigeno allo stato puro negli impianti a fanghi attivi),
W77-08545 5D

High Capacity Waste Water Treatment System,
W77-08566 5D

Oxygen System Activated Sludge Process.
W77-08575 5D

ADDITIVES
Cementing Oil and Gas Wells, Part 3,
W77-08328 8F

ADJACENT LANDOWNERS
Liability for Damages to Adjacent Land or Building Caused by Dredging,
W77-08387 6E

ADMINISTRATIVE AGENCIES
U.S. Environmental Protection Agency Environmental Research Outlook FY 1976 Through 1980 (Report to Congress).
W77-08120 6G

Toward Cleaner Water in the Pacific Northwest and Alaska--The National Water Permit Program.
W77-08121 5G

Snake River Land Co V State Board of Control (Beneficial Use of Water Held Sufficient Proof of Appropriation).
W77-08135 6E

EPA Focuses on Municipal Enforcement,
W77-08355 6E

Planning Challenges in the Management of Coastal Zone Water Resources,
W77-08376 6B

Ticket to Thermidor: A Commentary on the Proposed California Coastal Plan,
W77-08379 6B

Great Salt Lake Management and Development.
W77-08407 6E

ADMINISTRATIVE DECISIONS
Public Hearing Regarding 180-Day Notice to the Santa Fe Land Improvement Company of Violation of State and Federal Water Quality Standards for the Interstate Waters of the Kansas and Missouri Rivers, Held at Kansas City, Kansas on 13 July 1971.
W77-08381 5G

City of York V. Pennsylvania Department of Environmental Resources (Delegation of Authority Under the Pennsylvania Waste Management Act).
W77-08403 6E

Water Resources Commission V. Connecticut Sand and Stone Corporation (Judicial Review of Administrative Factual Determination).
W77-08404 6E

ADMINISTRATIVE REGULATIONS
Water Resource Policies and Authorities, Coastal Zone Management Program Implementation,
W77-08114 6E

Governmental Interest in Protecting Beach from Environmental Damage Through Overuse Outweighs Due Process Right to Bath Nude,
W77-08124 6E

Let's Have Achievable 'Safe' Drinking Water,
W77-08127 5G

EPA Focuses on Municipal Enforcement,
W77-08355 6E

Timber Products Processing Point Source Category Effluent Guidelines and Standards,
W77-08356 5G

Nonferrous Metals Manufacturing Point Source Category Pretreatment Standards.
W77-08357 5G

Effluent Guidelines and Standards for Fertilizer Manufacturing Point Source Category, Nitric Acid Subcategory.
W77-08360 5G

Proposed Effluent Guidelines and Standards for Iron and Steel Manufaturing,
W77-08370 5G

Effluent Guidelines and Standards for Canned and Preserved Fruits and Vegetables Point Source Category,
W77-08371 5G

Oil Spills and Spills of Hazardous Substances.
W77-08385 5G

Appropriation of Water.
W77-08405 6E

ADMIRALITY AND MARITIME JURISDICTION
Oil and Water--A New Look at the Uniformity Doctrine,
W77-08125 6E

ADOPTION OF PRACTICES
Computerized Planning System for Nuclear Power Plant Evaluation,
W77-08108 6B

ADSORPTION
Removing Explosives from Wastewater,
W77-08266 5D

Reduction of Mercury, Copper, Nickel, Cadmium, and Zinc Levels in Solution by Competitive Adsorption onto Peanut Hulls, and Raw and Aged Bark,
W77-08272 5D

Clay Adsorption Treatment of Non-Ionic Surfactants in Waste Water,
W77-08522 5D

Use of Oxygen in Activated Sludge Plants (Utilizzazione dell'ossigeno allo stato puro negli impianti a fanghi attivi),
W77-08545 5D

AERATED FLUID DRILLING
Air, Mist and Foam Drilling, A Look at the Latest Techniques, Part 2,
W77-08326 8C

AERATED TURBULENT JET FLOW
The Effect of Aeration of Water Jet Spreading,
W77-08197 8B

AERATION
The Effect of Aeration of Water Jet Spreading,
W77-08197 8B

Liquid Waste Treatment Apparatus,
W77-08263 5D

Occupational Characteristics and Biological Kinetic Constants of Extended Aeration Process,
W77-08270 5D

Oxygen Aeration at Newton Creek,
W77-08526 5D

Application of Corrugated Sheet Sprayers for Water Purification (Die Anwendung von Wellbahnrieslern in der Wasseraufbereitung),
W77-08543 5F

Mechanical Surface Aerator for Effluent Purification--Has the Liquid Scooped by the Curved Elements and Ejected into the Air Above,
W77-08558 5D

High Capacity Waste Water Treatment System,
W77-08566 5D

Aerators Control Lift Station Odor and Corrosion,
W77-08567 5G

Trends in Small Sewage Treatment Plants,
W77-08569 5D

Prospects Strong for Waste Water Oxygenation,
W77-08578 5D

Effluent Emphasis Underlines Environmental Effort at Enpocon,
W77-08579 5D

History and Development of the Oxidation Ditch,
W77-08587 5D

Plant Capacity to Increase,
W77-08597 5D

AEROBIC BACTERIA
Benthic Microbial Community Respiration of a Soft-Water Lake,
W77-08296 2H

AEROBIC CONDITIONS
Aerobic Digestion of Waste Activated Sludge at Low Temperatures,
W77-08527 5D

AEROBIC DIGESTION
Aerobic Digestion of Waste Activated Sludge at Low Temperatures,
W77-08527 5D

Aerobic Digestion of Sludges Precipitated from Waste Water by Lime Addition,
W77-08530 5D

AEROBIC SLUDGE *ANAEROBIC SLUDGE
Response of Oat and Spinach to Sewage Sludge Application in Soil,
W77-08495 5C

AEROBIC TREATMENT
Aerobic Digestion of Sludges Precipitated from Waste Water by Lime Addition,
W77-08530 5D

Aerobic Treatment of Liquid Wastes--With Oxygen Concentration Measured and Used to Control Pump Speed Used to Force Liquid Through Venturis.
W77-08557 5D

Sodium Bicarbonate Can Settle Many Waste Water Problem Upsets,
W77-08589 5D

AFRICA
The Operation of a Flood Warning Network: Its Use for Studying Flash Floods (Exploitation D'un Reseau D'alerte: Son Utilisation Pour L'etude Des Crues Brutales),
W77-08248 2E

Lake Naivasha and Lake Nakuru: An Ecological Comparison Between Two Bird Lakes in East Africa, (In Swedish),
W77-08324 2H

AGRICULTURAL CHEMICALS
Effluent Guidelines and Standards for Fertilizer Manufacturing Point Source Category, Nitric Acid Subcategory.
W77-08360 5G

AGRICULTURAL RUNOFF
Irrigated Agriculture: Nonpoint and Point Source Water Pollution,
W77-08116 5G

Diffuse Agricultural Pollution: The Economic Analysis of Alternative Controls,
W77-08329 5B

AGRICULTURAL WATER
An Analysis of Agricultural Water Requirements in the Tar-Neuse River Basin of North Carolina,
W77-08106 3F

Agricultural Water Demand in Wake County, North Carolina,
W77-08297 6D

AGRICULTURAL WATER DEMAND
An Analysis of Agricultural Water Requirements in the Tar-Neuse River Basin of North Carolina,
W77-08106 3F

Agricultural Water Demand in Wake County, North Carolina,
W77-08297 6D

AGRICULTURE
Proceedings of the NASA Earth Resources Survey Symposium, June 1975, Volume I-A, Technical Session Presentations, Agriculture-Environment.
W77-08408 7B

Agricultural Applications of Remote Sensing--A True Life Adventure,
W77-08424 3F

Practical Application of Remote Sensing in Agriculture,
W77-08425 3F

AIR POLLUTION SOURCES
Progress in MHI's Integrated Techniques for Environmental Protection,
W77-08533 5D

AIR-ROTARY DRILLING
Air, Mist and Foam Drilling, A Look at the Latest Techniques, Part 2,
W77-08326 8C

AIR TEMPERATURE
The Influence of Precipitation on Biochemical Oxygen Demand on Nine Streams in New Jersey,
W77-08203 5B

ALABAMA
A Simulation of an Irrigation Scheduling Model Which Incorporates Rainfall Predictions,
W77-08343 3F

State V Corps of Engineers (Cost/Benefit Analysis Under NEPA and the Flood Control Act).
W77-08400 6E

ALASKA
Toward Cleaner Water in the Pacific Northwest and Alaska--The National Water Permit Program.
W77-08121 5G

Combined Ice and Water Balances of Maclure Glacier, California, South Cascade Glacier, Washington, and Wolverine and Gulkana Glaciers, Alaska, 1967 Hydrologic Year,
W77-08473 2C

ALBERTA (CANADA)
Applications of Surface Resistivity Methods,
W77-08244 2F

ALGAL ASSAY
A Productivity Study of the Roanoke River Above Niagra Dam in Virginia,
W77-08333 5C

ALGAL GROWTH POTENTIAL
A Productivity Study of the Roanoke River Above Niagra Dam in Virginia,
W77-08333 5C

ALGAL TOXINS
Impact of Toxic Clones of Blue-Green Algae on Water Quality as Related to Aquatic Animals,
W77-08104 5C

Hypophthalmichthys Molitrix (Val.)) for Increasing Fish Productivity and Decreasing the Level of Eutrophication of Dnieper Reservoirs, (In Russian),
W77-08364 5C

The Ecological Significance of Antibiotic Substances Excreted by Algae in Waters, (In Polish),
W77-08463 5C

ALKALINITY
Is pH Pretreatment Necessary,
W77-08276 5D

Treatment of High Strength Acidic Waste Water with a Completely Mixed Anaerobic Filter,
W77-08524 5D

ALLUVIAL CHANNELS
Data for Calibrating Unsteady-Flow Sediment-Transport Models, East Fork River, Wyoming, 1975,
W77-08180 7C

Effects of Meandering in Alluvial Streams,
W77-08216 2E

ALLUVIAL STREAMS
Effects of Meandering in Alluvial Streams,
W77-08216 2E

ALTERNATE TERMINAL ELECTRON ACCEPTORS
Benthic Microbial Community Respiration of a Soft-Water Lake,
W77-08296 2H

ALTERNATIVE PLANNING
Water and Energy Systems: A Planning Model,
W77-08212 6A

Flood Management: Who Benefits and Who Pays,
W77-08303 6F

State V Corps of Engineers (Cost/Benefit Analysis Under NEPA and the Flood Control Act).
W77-08400 6E

ALTERNATIVE WATER USE
Digital-Model Analysis of the Effects of Water-Use Alternatives on Spring Discharges, Gooding and Jerome Counties, Idaho,
W77-08484 4B

ALUM PRECIPITATION
The Solubility of Particulate Phosphorus in the Effluent From Alum Treatment of Wastewater and Phosphorus Solutions,
W77-08500 5D

ALUMINUM
Closed-Loop System Separates Oil from Prewash Overflow,
W77-08271 5D

Fluoride Analysis of Water-Treatment-Plant Sludges,
W77-08342 5F

Nonferrous Metals Manufacturing Point Source Category Pretreatment Standards.
W77-08357 5G

ALUMINUM PHOSPHATE
Availability of Aluminum Phosphate Complexes to a Green Alga in Various Culture Media,
W77-08496 5D

AMERICAN FALLS RESERVOIR (IDAHO)
The Accumulation and Distribution of Organochlorines and Some Heavy Metals in American Falls Reservoir Fishes, Water and Sediment,
W77-08287 5B

AMERICAN FROZEN FOOD INSTITUTE
American Frozen Food v Train ('Guidelines' and 'Effluent Limitations' for the Potato Process Industry Pursuant to the Federal Water Pollution Control Act Amendments of 1972).
W77-08386 6E

AMMONIA
Treatment of Aqueous Condensates and Effluents from Coking Plants--With Alkali Salts of Weak Acids, to Expel Ammonia.
W77-08275 5D

AMMONIFICATION
A Method for Quantitative Determination of Ammonifying and Denitrifying Bacteria in Water with Applied Examples from Gravel-Pit Pools, (In Czech),
W77-08509 5A

AMMONIFYING BACTERIA
A Method for Quantitative Determination of Ammonifying and Denitrifying Bacteria in Water with Applied Examples from Gravel-Pit Pools, (In Czech),
W77-08509 5A

AMMONIUM COMPOUNDS
Effluent Guidelines and Standards for Fertilizer Manufacturing Point Source Category, Nitric Acid Subcategory.
W77-08360 5G

ANABAENA
Effects of pH and Inorganic Carbon Concentrations Upon Competition Between Anabaena flos-aquae and Selenastrum capricornutum,
W77-08200 5C

ANABAENA FLOS-AQUAE
Impact of Toxic Clones of Blue-Green Algae on Water Quality as Related to Aquatic Animals,
W77-08104 5C

ANAEROBIC BACTERIA
Benthic Microbial Community Respiration of a Soft-Water Lake,
W77-08296 2H

ANAEROBIC CONDITIONS
Treatment of High Strength Acidic Waste Water with a Completely Mixed Anaerobic Filter,
W77-08524 5D

ANAEROBIC DIGESTION
Sodium Bicarbonate Can Settle Many Waste Water Problem Upsets,
W77-08589 5D

Higher Gas Yields and Reduced Retention Times Obtained from Anaerobic Digester,
W77-08600 5D

ANALYTICAL TECHNIQUES
Determination of Pyridine in Farm Crops and Fish, (In Russian),
W77-08126 5A

Measurement of Flash Floods in the United States--State of the Art,
W77-08161 2E

Flash Floods in Spain (Les Crues Brutales En Espagne),
W77-08247 2E

Spectroanalytical Parameters of Fungal Metabolites: Oosporein and Desmethoxyviridiol,
W77-08449 2K

A Method for Quantitative Determination of Ammonifying and Denitrifying Bacteria in Water with Applied Examples from Gravel-Pit Pools, (In Czech),
W77-08509 5A

Confirmation of the Single-Step Membrane Filtration Procedure for Estimating Pseudomonas Aeruginosa Densities in Water,
W77-08518 5A

Enterovirus Types in Israel Sewage,
W77-08519 5A

Rapid Agar Pour-Plate Technique for Detection and Enumeration of Faecal Coliforms in Sewage,
W77-08520 5A

Improved Method for the Determination of Ethylenediaminetetraacetic Acid in Aqueous Environmental Samples by Gas-Liquid Chromatography,
W77-08521 5A

Determination of BOD After Freezing Water Samples (Bestimmung des BSB nach Einfrierung der Wasserproben),
W77-08546 5A

ANNUAL PEAK DISCHARGE
Annual Peak Discharges from Small Drainage Areas in Montana Through September 1976,
W77-08482 2E

ANTARCTIC
Resurvey of the 'Byrd' Station, Antarctica, Drill Hole,
W77-08227 2C

Radio-Echo Sounding: Reflections from Internal Layers in Ice Sheets,
W77-08230 2C

The Ecological Significance of Antibiotic Substances Excreted by Algae in Waters, (In Polish),
W77-08463 5C

ANTHRACITE MINING REFUSE
Reclamation of Anthracite Coal Refuse Using Treated Municipal Wastewater and Sludge,
W77-08189 5D

ANTIBIOTIC PROPERTIES (ALGAE)
The Ecological Significance of Antibiotic Substances Excreted by Algae in Waters, (In Polish),
W77-08463 5C

APACHE AND NAVAJO COUNTIES (ARIZ)
Maps Showing Ground-Water COnditions in the Puerco-Zuni Area, Apache and Navajo Counties, Arizona--1975,
W77-08471 7C

APHANIZOMENON FLOS-AQUAE
Impact of Toxic Clones of Blue-Green Algae on Water Quality as Related to Aquatic Animals,
W77-08104 5C

APPROPRIATION
Snake River Land Co V State Board of Control (Beneficial Use of Water Held Sufficient Proof of Appropriation).
W77-08135 6E

Should Rivers Have Running. Toward Extension of the Reserved Rights Doctrine to Include Minimum Stream Flows,
W77-08372 6E

Bank of America National Trust and Saving Association V State Water Resources Control Board (Condition Placed on Water Permit Defeated for Lack of Evidence of Necessity).
W77-08391 6E

Water Rights Generally; Appropriation.
W77-08393 6E

Appropriation of Water for Power (Hydroelectric Power Projects).
W77-08395 6E

Appropriation of Water.
W77-08405 6E

AQUATIC ALGAE
Lake Naivasha and Lake Nakuru: An Ecological Comparison Between Two Bird Lakes in East Africa, (In Swedish),
W77-08324 2H

AQUATIC MICROORGANISMS
Longitudinal Distribution of Selected Micronutrients in Northern San Francisco Bay During 1973,
W77-08487 5C

AQUATIC PLANTS
Lake Naivasha and Lake Nakuru: An Ecological Comparison Between Two Bird Lakes in East Africa, (In Swedish),
W77-08324 2H

AQUEOUS-PHASE OXIDATION
Involvement of Free Radicals in the Catalytic Oxidation of Phenol in Aqueous Solution,
W77-08201 5D

AQUICULTURE
27th Northwest Fish Culture Conference.
W77-08309 2I

Aquaculture: Problems of Implementation Under Existing Law,
W77-08369 6E

AQUIFER CHARACTERISTICS
Ground-Water Resources of Vanderburgh County, Indiana,
W77-08170 4B

Ground Water in the San Juan Metropolitan Area, Puerto Rico,
W77-08173 4B

Geohydrology of the Englishtown Formation in the Northern Coastal Plain of New Jersey,
W77-08175 2F

Geohydrology of the Albin and La Grange Areas, Southeastern Wyoming,
W77-08176 4B

Ground-Water Basic Data for Ramsey County, North Dakota,
W77-08177 7C

The Eutaw-McShan Aquifer in Mississippi,
W77-08466 7C

Historic Water-Level Changes and Pumpage from the Principal Aquifers of the Memphis Area, Tennessee: 1886-1975,
W77-08469 4B

Digital-Model Analysis of the Effects of Water-Use Alternatives on Spring Discharges, Gooding and Jerome Counties, Idaho,
W77-08484 4B

AQUIFER MANAGEMENT
Diagenesis of Middle and Upper Eocene Carbonate Shoreline Sequences, Central Florida.
W77-08208 2F

Allocating Buried Treasure: Federal Litigation Involving Interstate Ground Water,
W77-08491 6E

AQUIFERS
Diagenesis of Middle and Upper Eocene Carbonate Shoreline Sequences, Central Florida.
W77-08208 2F

Minimizing Costs in Well Field Design in Relation to Aquifer Models,
W77-08214 4B

Sanitary and Hygienic Characteristics of Subsurface Waters of the Tselinograd and Turgai Oblasts, (In Russian),
W77-08253 5B

Aquifer Modeling Helps Farmers.
W77-08317 2F

Groundwater Resources of Guam: Occurrence and Development,
W77-08448 4B

ARCTIC
Vertical Strain-Rate Measurements in an Arctic Ice Cap and Deductions from Them,
W77-08226 2C

A Further Comparison of Glacier Velocities Measured by Radio-Echo and Survey Methods,
W77-08228 2C

AREAL PRECIPITATION
Determining Areal Precipitation in the Basin and Range Province of Southern Arizona - Sonoita Creek Basin,
W77-08308 2B

ARID LANDS
Determination of Water-Resources Policies in Arid Lands,
W77-08453 6B

ARIZONA
PL 92-500: Phoenix V. the EPA,
W77-08128 5G

Farmers Investment Company V Bettwy (Doctrine of Reasonable Use as Applied to Groundwaters).
W77-08137 6E

Rainfall Infiltration Characteristics for a Semi-Arid Watershed Soil,
W77-08206 2G

A Computerized Information System Relating to Arizona's Water Resources,
W77-08307 7C

Determining Areal Precipitation in the Basin and Range Province of Southern Arizona - Sonoita Creek Basin,
W77-08308 2B

Water Supply and Control Developments Summarized, (Arizona).
W77-08313 6E

A Preliminary Analysis of the Energy and Water Requirements for Developing Geothermal Energy in Arizona,
W77-08351 4B

Practical Application of Remote Sensing in Agriculture,
W77-08425 3F

Maps Showing Ground-Water COnditions in the Puerco-Zuni Area, Apache and Navajo Counties, Arizona--1975,
W77-08471 7C

ARKANSAS
Population Dynamics and Species Diversity of Ichthyo-Parasitofauna of the Buffalo National River,
W77-08446 5C

ARSENIC
Arsenic in Water and Fish from Lakes Hartwell, Keowee, and Jocassee, South Carolina,
W77-08191 5A

ARTESIAN AQUIFERS
Digital-Computer Model of the Sandstone Aquifer in Southeastern Wisconsin,
W77-08478 2F

ARTESIAN WELLS
Artesian Wells.
W77-08397 6E

ARTIFICIAL SUBSTRATES
Invertebrate Colonization of Artificial Substrates in San Leandro Creek,
W77-08443 5A

ARTIFICIAL USE
Riparian Owner's Right to New Land Created by Reliction or by Accretion Influenced by Artificial Condition Not Produced by Such Owner.
W77-08398 6E

ASPHALT
Asphalt-Rubber Mixtures for Seepage Control,
W77-08195 4A

ATLANTIC COASTAL PLAIN
Geohydrology of the Englishtown Formation in the Northern Coastal Plain of New Jersey,
W77-08175 2F

ATLANTIC OCEAN
Relative Reflectance and Complex Refractive Index in the Infrared for Saline Environmental Waters,
W77-08215 2L

ATTENUATION COEFFICIENT (WATER)
Measurement of the Attenuation of Electromagnetic Radiation by Water in the Visible Region of the Spectrum,
W77-08293 1A

ATTITUDES
Citizen Participation in Comprehensive Water Resources Planning,
W77-08105 6B

Discriminant Analysis of Characteristics Determining Acceptance or Rejection of Nuclear Power,
W77-08109 6B

AUSTRALIA
Application of Three Daily-Rainfall Runoff Models to Four Australian Catchments,
W77-08218 2A

Physicochemical Treatment of an Australian Municipal Waste Water,
W77-08531 5D

AUSTRIA
A New Climatic Model for Glacier Behavior of the Austrian Alps,
W77-08235 2C

AUTOMATED MONITORING
Continuous Automated Monitoring of Chemical and Physical Characteristics of the Red Cedar River,
W77-08110 5A

AUTOMATIC CONTROLS
State of the Art in Sewage Treatment Plant Control,
W77-08515 5D

Suspended Solids Measurement Gives Improved Control,
W77-08568 5A

Automatic Control of Whitlingham Sewage Treatment Works Norwich,
W77-08585 5D

Reliable pH Measurement When Effluent Conditions Get Tough,
W77-08592 5A

AXISYMMETRIC JETS
The Effect of Aeration of Water Jet Spreading,
W77-08197 8B

BACTERIA
Bacteriological Investigation of Alberta Meat-Packing Plant Wastes with Emphasis on Salmonella Isolation,
W77-08269 5D

Bacterial Growth Kinetics in the Completely Mixed Activated Sludge Treatment of Fellmongery Effluent,
W77-08281 5D

Reproduction Rate and Productivity of Bacteria in the Ponds of the Karamet-Niyaz Fishery Farm, (In Russian),
W77-08462 5C

Bacterial Growth on Dissolved Organic Compounds in Fresh-Water Reservoirs, (In Russian),
W77-08498 5A

A Method for Quantitative Determination of Ammonifying and Denitrifying Bacteria in Water with Applied Examples from Gravel-Pit Pools, (In Czech),
W77-08509 5A

Pollution Indicator Bacteria Associated with Municipal Raw and Drinking Water Supplies,
W77-08516 5A

Confirmation of the Single-Step Membrane Filtration Procedure for Estimating Pseudomonas Aeruginosa Densities in Water,
W77-08518 5A

Rapid Agar Pour-Plate Technique for Detection and Enumeration of Faecal Coliforms in Sewage,
W77-08520 5A

BACTERIAL GROWTH
Bacterial Growth on Dissolved Organic Compounds in Fresh-Water Reservoirs, (In Russian),
W77-08498 5A

BACTERIOLOGY
Possibilities and Role of Biological Analysis in Evaluating the Degree of Pollution of Water Bodies, (In Russian),
W77-08430 5A

BASIN CHARACTERISTICS
Small-Stream Flood Investigations in Minnesota, October 1958 to September 1975,
W77-08481 2E

BASINS
Design and Operation of Rain Retention Basins (Entwurf und Betrieb von Regenruckhaltebecken),
W77-08547 8A

BASS
A Statistical Analysis of the Mercury Concentrations in Fish from Lake Jocassee, South Carolina,
W77-08190 5A

BAYS
Suspended-Particle Transport and Circulation in San Francisco Bay: An Overview,
W77-08486 2L

Longitudinal Distribution of Selected Micronutrients in Northern San Francisco Bay During 1973,
W77-08487 5C

Phytoplankton Production and Enumeration in Northern San Francisco Bay During 1972,
W77-08488 5C

Implications of Seasonal Chemical and Physical Factors on the Production of Phytoplankton in Northern San Francisco Bay,
W77-08489 5C

BEACH EROSION
Beach Profile Changes: East Coast of Lake Michigan, 1970-72,
W77-08440 2J

BEACH PROFILES
Beach Profile Changes: East Coast of Lake Michigan, 1970-72,
W77-08440 2J

BEACHES
Governmental Interest in Protecting Beach from Environmental Damage Through Overuse Outweighs Due Process Right to Bath Nude,
W77-08124 6E

BEAR RIVER COMPACT (IDA-UTA-WYO)
Bear River Compact,
W77-08155 6E

BED FORMS
Effects of Meandering in Alluvial Streams,
W77-08216 2E

BEDROCK
Stress in an Elastic Bedrock Hump Due to Glacier Flow,
W77-08236 2C

BEDROCK HUMPS
Stress in an Elastic Bedrock Hump Due to Glacier Flow,
W77-08236 2C

BEDS
Effects of Meandering in Alluvial Streams,
W77-08216 2E

BELGIUM
Recent Flash Floods of the Dison Brook (Crues Brutales Recentes Du 'Ruisseau' De Dison (Belgique): Observations Et Previsions),
W77-08250 4A

BENEFICIAL USE
Snake River Land Co V State Board of Control (Beneficial Use of Water Held Sufficient Proof of Appropriation).
W77-08135 6E

Reservoirs,
W77-08158 6E

Should Rivers Have Running. Toward Extension of the Reserved Rights Doctrine to Include Minimum Stream Flows,

Ideas Aplenty-But Still Sewers Face Cash Neglect.
W77-08554 8G

Seabed Sewers for Hong Kong,
W77-08555 5E

CONSTRUCTION COSTS
Construction and Maintenance Costs of Sewer Systems (Bau- und Betriebskosten von Kanalisationsanlagen),
W77-08542 8A

CONSTRUCTION GRANT PROGRAM
PL 92-500: Phoenix V. the EPA,
W77-08128 5G

CONSUMPTIVE USE
Legal Control of Consumptive Water Use in Pennsylvania Power Plants,
W77-08368 3E

Estimating Evapotranspiration in the North Platte Basin of Wyoming,
W77-08505 2D

CONTINENTAL SHELF
States' Rights in the Outer Continental Shelf Denied by the United States Supreme Court,
W77-08365 6E

CONTINUOUS MONITORING
Continuous Automated Monitoring of Chemical and Physical Characteristics of the Red Cedar River,
W77-08110 5A

CONVECTION
On the Relationship Between the Finite Element and Finite Difference Methods,
W77-08168 7A

A Study of Cooling Initially Uniform and Thermally Stratified Layers of Water,
W77-08444 5G

COOLING WATER
Year Round Cooling Water from the Cold Weather of Winter,
W77-08251 5D

COORDINATION
Water Resource Policies and Authorities, Coastal Zone Management Program Implementation,
W77-08114 6E

COPPER
Effect of Metals on Photosynthesis of Marine Phytoplankton, (In Russian),
W77-08160 5C

Reduction of Mercury, Copper, Nickel, Cadmium, and Zinc Levels in Solution by Competitive Adsorption onto Peanut Hulls, and Raw and Aged Bark,
W77-08272 5D

Nonferrous Metals Manufacturing Point Source Category Pretreatment Standards.
W77-08357 5G

CORE DRILLING
Analyses of Water, Core Material, and Elutriate Samples Collected Near New Orleans, Louisiana (Lake Pontchartrain, Louisiana, and Vicinity Hurricane Protection Project),
W77-08165 8D

CORN (FIELD)
Relationship Between Corn Yield, Expressed as a Percentage of Maximum, and the N Percentage in the Grain. I. Various N-Rate Experiments,
W77-08456 3F

CORROSION CONTROL
Aerators Control Lift Station Odor and Corrosion,
W77-08567 5G

CORRUGATED SHEET SPRAYERS
Application of Corrugated Sheet Sprayers for Water Purification (Die Anwendung von Wellbahnrieslern in der Wasseraufbereitung),
W77-08543 5F

COST-BENEFIT ANALYSIS
Sierra Club V Stamm (National Environmental Policy Act Does Not Require Comprehensive Environmental Impact Statement on Large Reclamation Project When EIS have been Prepared for Viable Portion of Project).
W77-08147 6E

Flood Management: Who Benefits and Who Pays,
W77-08303 6F

Urban Drainage and Flood Control Projects: Economic, Legal, and Financial Aspects,
W77-08345 6B

State V Corps of Engineers (Cost/Benefit Analysis Under NEPA and the Flood Control Act).
W77-08400 6E

COST COMPARISONS
What Lies Ahead for PAC,
W77-08541 5D

COST FUNCTIONS
Network Evaluation of Wastewater Collection Economics,
W77-08331 5D

COST MINIMIZATION
Minimizing Costs in Well Field Design in Relation to Aquifer Models,
W77-08214 4B

COST REPAYMENT
United States V Tulare Lake Canal Company (Reclamation Laws Concerning Sale of Land in Excess of 160 Acres).
W77-08151 6E

COSTS
Minimizing Costs in Well Field Design in Relation to Aquifer Models,
W77-08214 4B

Status of Reverse Osmosis Desalination Technology,
W77-08225 3A

Diffuse Agricultural Pollution: The Economic Analysis of Alternative Controls,
W77-08329 5B

CROP PRODUCTION
Relationship Between Corn Yield, Expressed as a Percentage of Maximum, and the N Percentage in the Grain. I. Various N-Rate Experiments,
W77-08456 3F

Growth of Tropical and Temperate Grasses at Palmerston North I. Warm-Season Yields With and Without Irrigation,
W77-08457 3F

Potential of New Summer Grasses in Northland: I. Warm-Season Yields Under Dryland and Irrigation,
W77-08458 3F

Improving Food Crop Production in the Sudan Savanna Zone of Northern Nigeria,
W77-08459 3F

CROPS
Practical Application of Remote Sensing in Agriculture,
W77-08425 3F

CRYOGENICS
Use of Oxygen in Activated Sludge Plants (Utilizzazione dell'ossigeno allo stato puro negli impianti a fanghi attivi),
W77-08545 5D

CRYSTALLOGRAPHY
Crystal Structure Analysis of Selected Pesticides by Single Crystal X-Ray Diffraction: The Crystal and Molecular Structure of Padan,
W77-08503 5A

CURRENTS (WATER)
Thermal Sensor for Measurement of Ocean Current Direction,
W77-08257 2L

CYANOPHYTA
Impact of Toxic Clones of Blue-Green Algae on Water Quality as Related to Aquatic Animals,
W77-08104 5C

Effects of pH and Inorganic Carbon Concentrations Upon Competition Between Anabaena flos-aquae and Selenastrum capricornutum,
W77-08200 5C

Hypophthalmichthys Molitrix (Val.)) for Increasing Fish Productivity and Decreasing the Level of Eutrophication of Dnieper Reservoirs, (In Russian),
W77-08364 5C

CYCLING NUTRIENTS
Mineral Cycling in Reservoirs,
W77-08217 5C

Availability of Aluminum Phosphate Complexes to a Green Alga in Various Culture Media,
W77-08496 5D

DAIRY FARMS
Diffuse Agricultural Pollution: The Economic Analysis of Alternative Controls,
W77-08329 5B

DALLAS RESERVOIR SYSTEM (TEX)
Implementation of an Optimization Model for Operation of a Metropolitan Reservoir System,
W77-08211 4A

DAM CONSTRUCTION
Natural Resources Defense Council V Stamm (National Environmental Policy Act Not Satisfied When EIS Fails to Discuss All Reasonable Alternatives to the Project).
W77-08148 6E

DAMAGES
Cementing Oil and Gas Wells, Part 2 - Casing Inspection and Pipe Handling Methods, Including Thread Make-Up Control,
W77-08327 8F

Liability for Damages to Adjacent Land or Building Caused by Dredging,
W77-08387 6E

DAMS
Aubert V Town of Fruita (Senior Direct Flow Rights Favored in Dispute Over Dam).
W77-08390 6E

DARTERS
Population Dynamics and Species Diversity of Ichthyo-Parasitofauna of the Buffalo National River,
W77-08446 5C

DATA ACQUISITION SYSTEMS
A Controllable Automated Environmental Data Acquisition and Monitoring System,
W77-08441 7C

DATA COLLECTIONS
Recent Flash Floods of the Dison Brook (Crues Brutales Recentes Du 'Ruisseau' De Dison (Belgique): Observations Et Previsions),
W77-08250 4A

Fox Chain of Lakes Investigation and Water Quality Management Plan,
W77-08442 2H

A Guide to the Use of HISARS -- A Hydrologic Information Storage and Retrieval System,
W77-08445 7C

Activities of the Water Resources Division in California.
W77-08479 7C

DATA MANAGEMENT SYSTEMS
Computerized Planning System for Nuclear Power Plant Evaluation,
W77-08108 6B

DATA PROCESSING
Trophic Status of Inland Lakes from LANDSAT,
W77-08434 5A

DATA STORAGE AND RETRIEVAL
Computerized Planning System for Nuclear Power Plant Evaluation,
W77-08108 6B

A Guide to the Use of HISARS -- A Hydrologic Information Storage and Retrieval System,
W77-08445 7C

DDT
The Accumulation and Distribution of Organochlorines and Some Heavy Metals in American Falls Reservoir Fishes, Water and Sediment,
W77-08287 5B

DEAD SEA (ISRAEL)
Relative Reflectance and Complex Refractive Index in the Infrared for Saline Environmental Waters,
W77-08215 2L

DECISION MAKING
Computerized Planning System for Nuclear Power Plant Evaluation,
W77-08108 6B

Classification and Test of Public Participation Concepts Applied to Local Resource Planning,
W77-08295 6B

DECOMPOSING ORGANIC MATTER
A Quantitative Study of Organic Carbon Decomposition and Nitrogen Transformations in Sewage Sludge-Soil Systems,
W77-08291 5B

DEEP WELLS
Water-Level Decline and Pumpage in Deep Wells in the Chicago Region, 1971-1975,
W77-08302 2F

Research on Cements for Geothermal and Deep Oil Wells,
W77-08320 8F

Deep Wells For Dewatering Offer Real Advantages, Part II,
W77-08325 4B

DEFOLIATION
Computer Analysis and Mapping of Gypsy Moth Defoliation Levels in Pennsylvania Using LANDSAT-1 Digital Data,
W77-08420 7C

DEHYDROGENASE ACTIVITY
Benthic Microbial Community Respiration of a Soft-Water Lake,
W77-08296 2H

DELINEATION METHODOLOGY
Delineation of Deciduous Wetland Forests in Northeastern Connecticut,
W77-08194 2G

DEMAND
RECSAD: A Computer Program for Recreation Planning,
W77-08300 6B

DEMINERALIZATION
Thermocompression-Type Apparatus for Desalting Saline Water,
W77-08252 3A

DENITRIFICATION
Process Design of Single-Sludge Activated Sludge Systems Using Nitrate Respiration,
W77-08336 5D

Full Scale Operation of Plug Flow Activated Sludge Systems,
W77-08451 5D

A Method for Quantitative Determination of Ammonifying and Denitrifying Bacteria in Water with Applied Examples from Gravel-Pit Pools, (In Czech),
W77-08509 5A

Factors Affecting the Denitrification Rate in Two Water-Sediment Systems,
W77-08517 5B

DENITRIFYING BACTERIA
A Method for Quantitative Determination of Ammonifying and Denitrifying Bacteria in Water with Applied Examples from Gravel-Pit Pools, (In Czech),
W77-08509 5A

DEPOSITION (SEDIMENTS)
American Sedimentation Law and Physical Processes,
W77-08130 6E

DEPTH HOAR
On Depth Hoar and the Strength of Snow,
W77-08239 2C

DESALINATION
Thermocompression-Type Apparatus for Desalting Saline Water,
W77-08252 3A

Forward Osmosis Extractors,
W77-08340 3A

DESALINATION APPARATUS
Status of Reverse Osmosis Desalination Technology,
W77-08225 3A

DESIGN
Process Design of Single-Sludge Activated Sludge Systems Using Nitrate Respiration,
W77-08336 5D

Channelization: Environmental, Geomorphic and Engineering Aspects,
W77-08352 8D

Moduflex Sewage Treatment Plants Provide the Answer to Growth,
W77-08588 5D

DESIGN CRITERIA
Analyses of Water, Core Material, and Elutriate Samples Collected Near New Orleans, Louisiana (Lake Pontchartrain, Louisiana, and Vicinity Hurricane Protection Project),
W77-08165 8D

Optimal Layout and Design of Storm Sewer Systems,
W77-08334 5D

Channelization: Environmental, Geomorphic and Engineering Aspects,
W77-08352 8D

Design of a Water Quality Monitoring Network,
W77-08497 5A

Design and Operation of Rain Retention Basins (Entwurf und Betrieb von Regenruckhaltebecken),
W77-08547 8A

Sewage Pumping Station Built to Handle Future System Demands,
W77-08550 8C

DESMETHOXYVIRIDIOL
Spectroanalytical Parameters of Fungal Metabolites: Oosporein and Desmethoxyviridiol,
W77-08449 2K

DESTRATIFICATION
Selective Withdrawal and Heated Water Discharge: Influence on the Water Quality of Lakes and Reservoirs Part I - Selective Withdrawal,
W77-08447 5G

DETOXIFICATION OF HG2+
Biochemical Transformation and Detoxification of Mercury in Aquatic Environment,
W77-08289 5C

DEVON ISLAND ICE CAP (CANADA)
Vertical Strain-Rate Measurements in an Arctic Ice Cap and Deductions from Them,
W77-08226 2C

A Further Comparison of Glacier Velocities Measured by Radio-Echo and Survey Methods,
W77-08228 2C

DEWATERING
Deep Wells For Dewatering Offer Real Advantages, Part II,
W77-08325 4B

Dewatering: A New Method Bows,
W77-08528 5D

Characterizing Sludge for Centrifugal Dewatering,
W77-08535 5D

Dewatering Machines (Entwasserungsmachinen),
W77-08544 5D

Sludge Dewatering Press.
W77-08581 5E

DIAGENESIS
Diagenesis of Middle and Upper Eocene Carbonate Shoreline Sequences, Central Florida.
W77-08208 2F

DIATOMS
The Utility of Paleolimnological Analyses of Lake Sediments for Evaluating Acid Precipitation Effects on Dilute Lakes,
W77-08103 5A

The Productivity of Fouling Organism Associations in Lake Zelenetskoe, (In Russian),
W77-08323 5C

DIELDRIN
The Accumulation and Distribution of Organochlorines and Some Heavy Metals in American Falls Reservoir Fishes, Water and Sediment,
W77-08287 5B

DIFFUSION
On the Relationship Between the Finite Element and Finite Difference Methods,
W77-08168 7A

DIP ANGLE (AQUIFERS)
Effect of Dip on the Storage of Fresh Water (or the Disposal of Waste) in a Saline Aquifer,
W77-08288 4B

DIPPING SYSTEM (WELLS)
Effect of Dip on the Subsurface Storage or Disposal of Fluid in Saline Aquifers,
W77-08204 4B

DIRECT FLOW RIGHTS
Aubert V Town of Fruita (Senior Direct Flow Rights Favored in Dispute Over Dam).
W77-08390 6E

DISCHARGE PERMIT PROVISIONS
PL 92-500: Phoenix V. the EPA,
W77-08128 5G

DISCHARGE (WATER)
Operation and Impact of NPDES in Region II, Part I,
W77-08117 5G

Ponce de Leon Condominiums v Digirolamo (Developer Responsible for Control of Surface Runoff).
W77-08136 6E

DISCRETE DIFFERENTIAL DYNAMIC PROGRAMMING
Optimal Layout and Design of Storm Sewer Systems,
W77-08334 5D

DISCRIMINANT ANALYSIS
Discriminant Analysis of Characteristics Determining Acceptance or Rejection of Nuclear Power,
W77-08109 6B

DISINFECTION
Bacteriological Investigation of Alberta Meat-Packing Plant Wastes with Emphasis on Salmonella Isolation,
W77-08269 5D

Ozone and Chlorine in Waste Water Disinfection,
W77-08536 5D

Chlorobiphenyls and PCB's: Formation During Chlorination,
W77-08538 5A

Sewage Sludge Disinfected by Electron-Beam Bombardment.
W77-08580 5D

DISON BROOK (BELGIUM)
Recent Flash Floods of the Dison Brook (Crues Brutales Recentes Du 'Ruisseau' De Dison (Belgique): Observations Et Previsions),
W77-08250 4A

DISPERSION
Statistical Characterization of Dilute Particulate Suspensions in Turbulent Fluid Fields,
W77-08330 5B

DISSOLVED ORGANIC CARBON
Benthic Microbial Community Respiration of a Soft-Water Lake,
W77-08296 2H

DISSOLVED OXYGEN
Factors Affecting the Denitrification Rate in Two Water-Sediment Systems,
W77-08517 5B

Improved Galvanic Dissolved Oxygen Sensor for Activated Sludge,
W77-08539 5A

DISSOLVED SOLIDS
Investigation of Detection Limits for Solutes in Water Measured by Laser Raman Spectrometry,
W77-08171 2K

Dissolved Solids, Hardness, and Orthophosphate of Surface-Water Runoff in the Northwest Florida Water Management District,
W77-08467 7C

DISTILLATION
Fluoride Analysis of Water-Treatment-Plant Sludges,
W77-08342 5F

DISTRIBUTION SYSTEMS
Irrigation and Irrigation Districts.
W77-08396 6E

DITCHES
Anderson V Yearous (Rights of Dominant Owners to Unobstructed Use of Drainage Easements).
W77-08392 6E

Water Districts and Commissioners.
W77-08406 6E

DIVERSION
Can a State Embargo the Export of Water by Transbasin Diversions,
W77-08129 6E

Withdrawal of Certain Waters from Appropriation: Special Municipal and County Water Rights,
W77-08142 6E

INTERSTATE RIVERS
Can a State Embargo the Export of Water by Transbasin Diversions,
W77-08129 6E

Compliance with the Provisions of the Federal Water Pollution Control Act as Amended in 1972.
W77-08153 6E

Interstate Stream Commission (Creation, Membership, General Powers).
W77-08402 6E

INVERTEBRATES
The Influence of Brackish-Water Intrusion on Macroinvertebrate Associations of the Lower Tchefuncte River, Louisiana,
W77-08292 5B

Invertebrate Colonization of Artificial Substrates in San Leandro Creek,
W77-08443 5A

ION EXCHANGE
Physicochemical Treatment of an Australian Municipal Waste Water,
W77-08531 5D

IOWA
Anderson V Yearous (Rights of Dominant Owners to Unobstructed Use of Drainage Easements).
W77-08392 6E

Relationship Between Corn Yield, Expressed as a Percentage of Maximum, and the N Percentage in the Grain. I. Various N-Rate Experiments,
W77-08456 3F

IRON
Sanitary and Hygienic Characteristics of Subsurface Waters of the Tselinograd and Turgai Oblasts, (In Russian),
W77-08253 5B

Proposed Effluent Guidelines and Standards for Iron and Steel Manufaturing,
W77-08370 5G

Fractionation and Control of Iron in Channelized and Swamp Drainage Streams in North Carolina,
W77-08510 5B

IRON ALLOYS
Proposed Effluent Guidelines and Standards for Iron and Steel Manufaturing,
W77-08370 5G

IRRADIATION
Sewage Sludge Disinfected by Electron-Beam Bombardment.
W77-08580 5D

IRRIGATION
Irrigated Agriculture: Nonpoint and Point Source Water Pollution,
W77-08116 5G

Water Allocation and Pricing for Control of Irrigation-Related Salinity in a River Basin,
W77-08213 5G

Year Round Cooling Water from the Cold Weather of Winter,
W77-08251 5D

A Simulation of an Irrigation Scheduling Model Which Incorporates Rainfall Predictions,
W77-08343 3F

Irrigation and Irrigation Districts.
W77-08396 6E

IRRIGATION DISTRICTS
Irrigation and Irrigation Districts.
W77-08396 6E

Interstate Stream Commission (Creation, Membership, General Powers).
W77-08402 6E

IRRIGATION EFFECTS
Water for Food - Or for More Important Purposes. (Reallocation of Irrigation Water to Cities and Industries),
W77-08377 6E

Potential of New Summer Grasses in Northland: I. Warm-Season Yields Under Dryland and Irrigation,
W77-08458 3F

IRRIGATION EFFICIENCY
Irrigated Agriculture: Nonpoint and Point Source Water Pollution,
W77-08116 5G

Economic Impacts of Controlling Water Quality in an Irrigated River Basin,
W77-08332 5G

IRRIGATION PERMITS
Sale of Water Rights,
W77-08140 6E

IRRIGATION PROGRAMS
United States V Tulare Lake Canal Company (Reclamation Laws Concerning Sale of Land in Excess of 160 Acres).
W77-08151 6E

IRRIGATION SCHEDULING MODELS
A Simulation of an Irrigation Scheduling Model Which Incorporates Rainfall Predictions,
W77-08343 3F

IRRIGATION SYSTEMS
Reclamation and Use of Disturbed Land in the Southwest.
W77-08452 5G

IRRIGATION WATER
An Analysis of Agricultural Water Requirements in the Tar-Neuse River Basin of North Carolina,
W77-08106 3F

Agricultural Water Demand in Wake County, North Carolina,
W77-08297 6D

Water for Food - Or for More Important Purposes. (Reallocation of Irrigation Water to Cities and Industries),
W77-08377 6E

Water Quality in the Texas Coastal Basins,
W77-08465 5B

IRRIGATION WELLS
Geohydrology of the Albin and La Grange Areas, Southeastern Wyoming,
W77-08176 4B

ISLANDS
Hibiscus Harbor, Inc. V. State (Metes and Bounds Description Favored Over Low Water Mark in Determining Outcome of Boundary Dispute).
W77-08389 6E

ISOHYETS
Determining Areal Precipitation in the Basin and Range Province of Southern Arizona - Sonoita Creek Basin,
W77-08308 2B

ISOLATION
Bacteriological Investigation of Alberta Meat-Packing Plant Wastes with Emphasis on Salmonella Isolation,
W77-08269 5D

ISRAEL
Production of Energy From Concentrated Brines by Pressure-Retarded Osmosis, 1. Preliminary Technical and Economic Correlations,
W77-08233 3A

Enterovirus Types in Israel Sewage,
W77-08519 5A

JET TRAJECTORY
The Effect of Aeration of Water Jet Spreading,
W77-08197 8B

JETS
The Effect of Aeration of Water Jet Spreading,
W77-08197 8B

JOINTS (CONNECTIONS)
Plain-End Pipe 'Collars' Problem Sewer Connections,
W77-08553 8G

JORDAN
Bacteriological Pollution in the Drinking-Water of Jordan,
W77-08454 5B

JOSHUA TREE NATIONAL MONUMENT (CALIF)
Ground-Water Data for 1974-75 in Joshua Tree National Monument, California,
W77-08164 7C

JUDICIAL DECISIONS
United States V Osage Company (Removal of Sunken Boats Obstructing Navigable Waters Owner's Responsibility).
W77-08150 6E

Winkle V Mitera (Riparian Rights of An Island Owner),
W77-08159 6E

Environmental Law-Application of the Refuse Act of 1899 to Continual Industrial Discharges Is Upheld Without Formalized Permit Procedures,
W77-08382 5G

Ohio Liquid Disposal, Inc V Dawe (Defining 'Waters of the State' Within Water Pollution Control Statute).
W77-08401 6E

KANSAS
Irrigation and Irrigation Districts.
W77-08396 6E

Quantitative Water Quality with Landsat and Skylab.
W77-08431 5A

Remote Sensing Applications in Kansas,
W77-08437 4A

Hydrologic Unit Map--1974, State of Kansas.
W77-08477 7C

KANSAS IRRIGATION DISTRICTS
Irrigation and Irrigation Districts.
W77-08396 6E

KANSAS RIVER
Public Hearing Regarding 180-Day Notice to the Santa Fe Land Improvement Company of Violation of State and Federal Water Quality Standards for the Interstate Waters of the Kansas and Missouri Rivers, Held at Kansas City, Kansas on 13 July 1971.
W77-08381 5G

KENTUCKY
Application of EREP, LANDSAT and Aircraft Image Data to Environmental Problems Related to Coal Mining,
W77-08429 5A

KENYA
U S Geological Survey, Water Resources Division, Radiocarbon Measurements I,
W77-08169 4B

KINETICS
Involvement of Free Radicals in the Catalytic Oxidation of Phenol in Aqueous Solution,
W77-08201 5D

Occupational Characteristics and Biological Kinetic Constants of Extended Aeration Process,
W77-08270 5D

Bacterial Growth Kinetics in the Completely Mixed Activated Sludge Treatment of Fellmongery Effluent,
W77-08281 5D

A Comparison of the Methods for Calculating the Constants for the First Order BOD Equation,
W77-08494 5B

Biological Treatment Kinetics of Landfill Leachate,
W77-08532 5D

KOBE (JAPAN)
The Sanitary Landfill Leachate Control Plant in Kobe.
W77-08534 5D

LABORATORY TESTS
Mathematical and Experimental Investigation of Nonsteady State Thickening of an Ideal Slurry,
W77-08207 5D

Transference: A Comprehensive Parameter Governing Permeation of Solutes Through Membranes,
W77-08231 3A

Sorption and Flow of Carbon Dioxide and Some Hydrocarbons in a Microporous Carbon Membrane,
W77-08232 5A

Impurity Concentrations in Sea Ice,
W77-08237 2C

LAKE BAIKAL (USSR)
Characteristics of the Biotic Cycle of Lake Baikal, (In Russian),
W77-08321 2H

LAKE ERIE
Lake Erie International Jetport Model Feasibility Investigation; The Wind-Driven Currents and Contaminant Dispersion in the Near-Shore of Large Lakes,
W77-08220 5B

LAKE JOCASSEE (SC)
A Statistical Analysis of the Mercury Concentrations in Fish from Lake Jocassee, South Carolina,
W77-08190 5A

LAKE LAHONTAN (NEV)
Pluvial Lakes of Nevada and Estimated Full Pluvial Climates,
W77-08199 2H

LAKE MICHIGAN
Beach Profile Changes: East Coast of Lake Michigan, 1970-72,
W77-08440 2J

LAKE NAIVASHA (EAST AFRICA)
Lake Naivasha and Lake Nakuru: An Ecological Comparison Between Two Bird Lakes in East Africa, (In Swedish),
W77-08324 2H

LAKE NAKURU (EAST AFRICA)
Lake Naivasha and Lake Nakuru: An Ecological Comparison Between Two Bird Lakes in East Africa, (In Swedish),
W77-08324 2H

LAKE PONTCHARTRAIN AREA (LA)
Analyses of Water, Core Material, and Elutriate Samples Collected Near New Orleans, Louisiana (Lake Pontchartrain, Louisiana, and Vicinity Hurricane Protection Project),
W77-08165 8D

LAKE ROTORUA (NEW ZEALAND)
Nitrogen and Phosphorus Analyses of Rainfall at Rotorua, New Zealand,
W77-08242 5A

The Fallout of Nitrogen and Phosphorus Compounds from the Atmosphere at Ngapuna, Near Rotorua, New Zealand,
W77-08243 5A

LAKE SEDIMENTS
The Utility of Paleolimnological Analyses of Lake Sediments for Evaluating Acid Precipitation Effects on Dilute Lakes,
W77-08103 5A

Benthic Microbial Community Respiration of a Soft-Water Lake,
W77-08296 2H

Laminated Sediments in Holomictic Berkshire Lakes,
W77-08341 2J

LAKE SHELLENBARGER (MICH)
Michigan Conference Association of Seventh-Day Adventists V Commission of Natural Resources (Private Lakes with No Obvious Public Access Closed to the Public).
W77-08149 6E

LAKE SHORES
Mc Cardel V Smolen (The Rights of Riparian and Nonriparian Owners to Recreational Use of Navigable Inland Lakes).
W77-08138 6E

Pluvial Lakes of Nevada and Estimated Full Pluvial Climates,
W77-08199 2H

LAKE ZELENETSKOE (USSR)
The Productivity of Fouling Organism Associations in Lake Zelenetskoe, (In Russian),
W77-08323 5C

LAKES
Michigan Conference Association of Seventh-Day Adventists V Commission of Natural Resources (Private Lakes with No Obvious Public Access Closed to the Public).
W77-08149 6E

Transient Three-Dimensional Circulation of Lakes,
W77-08181 2H

Lake Naivasha and Lake Nakuru: An Ecological Comparison Between Two Bird Lakes in East Africa, (In Swedish),
W77-08324 2H

The LANDSAT-1 Multispectral Scanner as a Tool in the Classification of Inland Lakes,
W77-08433 5A

Trophic Status of Inland Lakes from LANDSAT,
W77-08434 5A

The Use of LANDSAT-1 Imagery for Water Quality Studies in Southern Scandinavia,
W77-08435 5A

Fox Chain of Lakes Investigation and Water Quality Management Plan,
W77-08442 2H

LAMINATED SEDIMENTS
Laminated Sediments in Holomictic Berkshire Lakes,
W77-08341 2J

LAND AND WATER CONSERVATION FUND PROGRAM
Flood Plains for Open Space and Recreation.
W77-08374 6F

LAND DEVELOPMENT
Remote Sensing Applications in Kansas,
W77-08437 4A

LAND DISPOSAL
Spray Irrigation of Treated Municipal Sewage Effluent and Its Effect on Chemical Properties of Forest Soil,
W77-08202 5D

LAND FORMING
State v. Matzen (Use of Historical Maps to Settle Claims to Accretion Lands).
W77-08139 6E

LAND IRRIGATION
Spray Irrigation of Treated Municipal Sewage Effluent and Its Effect on Chemical Properties of Forest Soil,
W77-08202 5D

LAND SUBSIDENCE
Winkle V Mitera (Riparian Rights of An Island Owner),
W77-08159 6E

LAND TENURE
United States V Tulare Lake Canal Company (Reclamation Laws Concerning Sale of Land in Excess of 160 Acres).
W77-08151 6E

LAND USE
Sediment Yield and Land Use in Southwest United States,
W77-08178 4D

University Public Service Programs as They Relate to Water Resources Management in Wisconsin,
W77-08209 6E

The 1972 Water Pollution Control Act: Unforeseen Implications for Land Use Planning,
W77-08373 5G

Wildlife Management by Habitat Units--A Preliminary Plan of Action,

ORGANIC COMPOUNDS
Removing Explosives from Wastewater,
W77-08266 5D

Ozone Effect of Synthetic Rubber Waste Treatment,
W77-08267 5D

Reduction of Mercury, Copper, Nickel, Cadmium, and Zinc Levels in Solution by Competitive Adsorption onto Peanut Hulls, and Raw and Aged Bark,
W77-08272 5D

Is pH Pretreatment Necessary,
W77-08276 5D

Bacterial Growth on Dissolved Organic Compounds in Fresh-Water Reservoirs, (In Russian),
W77-08498 5A

ORGANIC LOADING
Effects of High Organic Loading on Mixed Photosynthetic Waste Water Treatment,
W77-08540 5D

ORGANIC MATTER
Effects of High Organic Loading on Mixed Photosynthetic Waste Water Treatment,
W77-08540 5D

ORGANIC WASTES
Waste Impoundment Efficiency at Sugar Mill,
W77-08268 5D

ORGANOCHLORINES
The Accumulation and Distribution of Organochlorines and Some Heavy Metals in American Falls Reservoir Fishes, Water and Sediment,
W77-08287 5B

ORTHOPHOSPHATES
Dissolved Solids, Hardness, and Orthophosphate of Surface-Water Runoff in the Northwest Florida Water Management District,
W77-08467 7C

OSMOSIS
Production of Energy From Concentrated Brines by Pressure-Retarded Osmosis, 1. Preliminary Technical and Economic Correlations,
W77-08233 3A

Forward Osmosis Extractors,
W77-08340 3A

OSMOTIC POTENTIAL
The Influences of Simulated Moisture Stress Conditions and Osmotic Substrates on Germination and Growth of Cultivated and Wild Safflowers,
W77-08460 2I

OSMOTIC PRESSURE
The Influences of Simulated Moisture Stress Conditions and Osmotic Substrates on Germination and Growth of Cultivated and Wild Safflowers,
W77-08460 2I

OSMUNDA REGALIS
Chromosome Mutations in a Fern Population Growing in a Polluted Environment: A Bioassay for Mutagens in Aquatic Environments,
W77-08305 5A

OUTER CONTINENTAL SHELF
States' Rights in the Outer Continental Shelf Denied by the United States Supreme Court,
W77-08365 6E

OVERDRAFT
A Postscript to the Mutual Prescription Doctrine--City of Los Angeles V City of San Fernando,
W77-08490 6E

OWNERSHIP
Mc Cardel V Smolen (The Rights of Riparian and Nonriparian Owners to Recreational Use of Navigable Inland Lakes).
W77-08138 6E

OXIDATION
Full Scale Operation of Plug Flow Activated Sludge Systems,
W77-08451 5D

OXIDATION DITCHES
History and Development of the Oxidation Ditch,
W77-08587 5D

OXIDATION LAGOONS
Waste Impoundment Efficiency at Sugar Mill,
W77-08268 5D

History and Development of the Oxidation Ditch,
W77-08587 5D

Plant Capacity to Increase,
W77-08597 5D

OXYGEN
Benthic Microbial Community Respiration of a Soft-Water Lake,
W77-08296 2H

Oxygen Aeration at Newton Creek,
W77-08526 5D

Aerobic Treatment of Liquid Wastes--With Oxygen Concentration Measured and Used to Control Pump Speed Used to Force Liquid Through Venturis.
W77-08557 5D

BOC Blows Bubbles in Dirty Bath Water,
W77-08564 5D

Pre-Treatment in the Sewer,
W77-08596 5D

Plant Capacity to Increase,
W77-08597 5D

OXYGEN DEMAND
The Mathematical Description of the BOD Reaction in Stream Water,
W77-08493 5B

A Comparison of the Methods for Calculating the Constants for the First Order BOD Equation,
W77-08494 5B

OXYGEN DEPLETION
Impact of Toxic Clones of Blue-Green Algae on Water Quality as Related to Aquatic Animals,
W77-08104 5C

OXYGENATION
Use of Oxygen in Activated Sludge Plants (Utilizzazione dell'ossigeno allo stato puro negli impianti a fanghi attivi),
W77-08545 5D

Oxygen System Activated Sludge Process.
W77-08575 5D

Prospects Strong for Waste Water Oxygenation,
W77-08578 5D

Effluent Emphasis Underlines Environmental Effort at Enpocon,
W77-08579 5D

History and Development of the Oxidation Ditch,
W77-08587 5D

Oxygen Injection for Bath's Sewers,
W77-08599 5D

OZONE
Ozone Effect of Synthetic Rubber Waste Treatment,
W77-08267 5D

Ozone and Chlorine in Waste Water Disinfection,
W77-08536 5D

PACIFIC NORTHWEST U.S.
Toward Cleaner Water in the Pacific Northwest and Alaska--The National Water Permit Program.
W77-08121 5G

27th Northwest Fish Culture Conference.
W77-08309 2I

PACIFIC NORTHWEST US
Pumped-Storage in the Pacific Northwest, An Inventory.
W77-08224 2H

PACIFIC OCEAN
Relative Reflectance and Complex Refractive Index in the Infrared for Saline Environmental Waters,
W77-08215 2L

PADAN
Crystal Structure Analysis of Selected Pesticides by Single Crystal X-Ray Diffraction: The Crystal and Molecular Structure of Padan,
W77-08503 5A

PALEOHYDROLOGY
Pluvial Lakes of Nevada and Estimated Full Pluvial Climates,
W77-08199 2H

PALEOLIMNOLOGY
The Utility of Paleolimnological Analyses of Lake Sediments for Evaluating Acid Precipitation Effects on Dilute Lakes,
W77-08103 5A

PARTICLE SIZE
Statistical Characterization of Dilute Particulate Suspensions in Turbulent Fluid Fields,
W77-08330 5B

Suspended-Particle Transport and Circulation in San Francisco Bay: An Overview,
W77-08486 2L

PARTICLE VELOCITY
An Earthquake Risk Model That Incorporates Local Near Surface Site Conditions,
W77-08348 8E

PARTICULATE TRANSPORT
Statistical Characterization of Dilute Particulate Suspensions in Turbulent Fluid Fields,
W77-08330 5B

PATENTS
Year Round Cooling Water from the Cold Weather of Winter,
W77-08251 5D

Thermocompression-Type Apparatus for Desalting Saline Water,
W77-08252 3A

Method of Purification of Waste Water By Treatment with Zirconium Salt,
W77-08255 5D

Thermal Sensor for Measurement of Ocean Current Direction,
W77-08257 2L

Kraft Mill Recovery System,
W77-08258 5D

Precoat for Permeability Separation Systems,
W77-08259 5D

Method of Dispersing Oil in Water,
W77-08260 5G

Pump-Filter for Bilge Water,
W77-08261 5G

Marine Life Protector,
W77-08262 8I

Liquid Waste Treatment Apparatus,
W77-08263 5D

Apparatus for Continuous Liquid-Liquid Extraction of Water with a Solvent,
W77-08264 5F

Treatment of Aqueous Condensates and Effluents from Coking Plants--With Alkali Salts of Weak Acids, to Expel Ammonia.
W77-08275 5D

Purifying Biological Effluent Rich in Carbohydrates or Protein--By Anaerobic Fermentation Separation, Aerobic Treatment and Then Separation.
W77-08277 5D

Aerobic Treatment of Liquid Wastes--With Oxygen Concentration Measured and Used to Control Pump Speed Used to Force Liquid Through Venturis.
W77-08557 5D

Mechanical Surface Aerator for Effluent Purification--Has the Liquid Scooped by the Curved Elements and Ejected into the Air Above,
W77-08558 5D

Breaking Down Solid and Liquid Waste to Form a Fertilizer--By Inoculation with Selected Fungi and Fermentation.
W77-08559 5E

Sludge Collector and Light Liquid, Separator--from Sewage with Two Tanks in Single Housing and Cover.
W77-08560 5D

Cleaning of Sewage Sludge System.
W77-08561 5D

Screening Apparatus for Removal of Solids--from Sewage with Rotating Screen and Vertical Lift for Residues.
W77-08562 5D

Sewage Disposal System.
W77-08563 5E

PATH OF POLLUTANTS
A Predictive Model for Transient Temperature Distributions in Unsteady Flows,
W77-08221 5B

PEAK DISCHARGE
Small-Stream Flood Investigations in Minnesota, October 1958 to September 1975,
W77-08481 2E

PEANUT HULLS
Reduction of Mercury, Copper, Nickel, Cadmium, and Zinc Levels in Solution by Competitive Adsorption onto Peanut Hulls, and Raw and Aged Bark,
W77-08272 5D

PENALTIES (LEGAL)
A New Measure of Damage for Wrongfully Appropriated Water,
W77-08361 4A

PENNSYLVANIA
United States V Osage Company (Removal of Sunken Boats Obstructing Navigable Waters Owner's Responsibility).
W77-08150 6E

Reclamation of Anthracite Coal Refuse Using Treated Municipal Wastewater and Sludge,
W77-08189 5D

A Predictive Model for Transient Temperature Distributions in Unsteady Flows,
W77-08221 5B

Public Rights in Pennsylvania Waters,
W77-08362 6E

Legal Control of Consumptive Water Use in Pennsylvania Power Plants,
W77-08368 3E

City of York V. Pennsylvania Department of Environmental Resources (Delegation of Authority Under the Pennsylvania Waste Management Act).
W77-08403 6E

Computer Analysis and Mapping of Gypsy Moth Defoliation Levels in Pennsylvania Using LANDSAT-1 Digital Data,
W77-08420 7C

PERFORMANCE
Full Scale Operation of Plug Flow Activated Sludge Systems,
W77-08451 5D

Research into the Impact on Electrical Equipment from Variable Speed Operation of Pumped-Storage Plants,
W77-08492 8C

Reverse Osmosis on Secondary Sewage Effluent: The Effect of Recovery,
W77-08523 5D

Unstratified-Bed Filtration of Waste Water,
W77-08537 5D

An Estimation of the Efficiency of a Waste Water Treatment Plant, as Measured by Several Parameters Including Lipid Biodegradation (Essai d'evaluation de l'efficacite d'une station d'epuration a l'aide de plusieurs parametres dont la biodegradation des lipides),
W77-08548 5D

The Trials and Tribulations of Treatment Works in Lower Trent.
W77-08593 5D

PERMEABILITY
Diagenesis of Middle and Upper Eocene Carbonate Shoreline Sequences, Central Florida.
W77-08208 2F

Transference: A Comprehensive Parameter Governing Permeation of Solutes Through Membranes,
W77-08231 3A

PERMIT COMPLIANCE PROCESS
EPA Focuses on Municipal Enforcement,
W77-08355 6E

PERMITS
Operation and Impact of NPDES in Region II, Part I,
W77-08117 5G

Federal Water Pollution Control Act Amendments of 1972 Reach Polluting Activities Oc-

curring Above Mean-High Water Line (Comment on U. S. V. Holland).
W77-08118 5G

Compliance with the Provisions of the Federal Water Pollution Control Act as Amended in 1972.
W77-08153 6E

Reservoirs,
W77-08158 6E

American Petroleum Institute V Environmental Protection Agency (Challenge to EPA Standards for Refineries Under the FWPCA Amendments of 1972).
W77-08394 6E

Appropriation of Water for Power (Hydroelectric Power Projects).
W77-08395 6E

PERMSELECTIVE MEMBRANES
Forward Osmosis Extractors,
W77-08340 3A

PESTICIDE RESIDUES
The Accumulation and Distribution of Organochlorines and Some Heavy Metals in American Falls Reservoir Fishes, Water and Sediment,
W77-08287 5B

Crystal Structure Analysis of Selected Pesticides by Single Crystal X-Ray Diffraction: The Crystal and Molecular Structure of Padan,
W77-08503 5A

PESTICIDES
Sources, Characteristics and Treatment and Disposal of Industrial Wastes Containing Hexachlorobenzene,
W77-08265 5D

Crystal Structure Analysis of Selected Pesticides by Single Crystal X-Ray Diffraction: The Crystal and Molecular Structure of Padan,
W77-08503 5A

The Effect of Soluble Organic Matter On the Utilization of Phenoxy Herbicides by Pseudomonas sp.,
W77-08504 5C

PETROGRAPHY
Diagenesis of Middle and Upper Eocene Carbonate Shoreline Sequences, Central Florida.
W77-08208 2F

PHAEOCYSTIS-POUCHETII
The Ecological Significance of Antibiotic Substances Excreted by Algae in Waters, (In Polish),
W77-08463 5C

PHENOL
Involvement of Free Radicals in the Catalytic Oxidation of Phenol in Aqueous Solution,
W77-08201 5D

PHENOLIC RESINS
Resin-Coated Gravel is Used to Help Control Sand,
W77-08316 8G

PHILLIPINES
New Water Legislation--Drafting for Development, Efficient Allocation and Environmental Protection,
W77-08188 6E

PHOSPHATES
Detection of Phosphate Adsorption onto Coal Humic Acids,
W77-08294 5A

Pyro- and Tripoly-Phosphate Contents of Sediments,
W77-08306 5A

Dissolved Solids, Hardness, and Orthophosphate of Surface-Water Runoff in the Northwest Florida Water Management District,
W77-08467 7C

Availability of Aluminum Phosphate Complexes to a Green Alga in Various Culture Media,
W77-08496 5D

PHOSPHORESCENCE
Spectroanalytical Parameters of Fungal Metabolites: Oosporein and Desmethoxyviridiol,
W77-08449 2K

PHOSPHORUS
Nitrogen and Phosphorus Analyses of Rainfall at Rotorua, New Zealand,
W77-08242 5A

The Fallout of Nitrogen and Phosphorus Compounds from the Atmosphere at Ngapuna, Near Rotorua, New Zealand,
W77-08243 5A

Characteristics of the Biotic Cycle of Lake Baikal, (In Russian),
W77-08321 2H

A Productivity Study of the Roanoke River Above Niagra Dam in Virginia,
W77-08333 5C

A Predictive Phosphorus Model for Lakes - Sensitivity Analysis and Applications,
W77-08499 5C

Phosphorus Exchange at the Sediment-Water Interface of Selected Narragansett Bay Sediments,
W77-08502 5C

PHOSPHORUS COMPOUNDS
Nitrogen and Phosphorus Analyses of Rainfall at Rotorua, New Zealand,
W77-08242 5A

The Fallout of Nitrogen and Phosphorus Compounds from the Atmosphere at Ngapuna, Near Rotorua, New Zealand,
W77-08243 5A

PHOSPHORUS REMOVAL
Full Scale Operation of Plug Flow Activated Sludge Systems,
W77-08451 5D

The Solubility of Particulate Phosphorus in the Effluent From Alum Treatment of Wastewater and Phosphorus Solutions,
W77-08500 5D

PHOTOSYNTHESIS
Effect of Metals on Photosynthesis of Marine Phytoplankton, (In Russian),
W77-08160 5C

Effects of pH and Inorganic Carbon Concentrations Upon Competition Between Anabaena flos-aquae and Selenastrum capricornutum,
W77-08200 5C

Growth of Tropical and Temperate Grasses at Palmerston North I. Warm-Season Yields With and Without Irrigation,
W77-08457 3F

Effects of High Organic Loading on Mixed Photosynthetic Waste Water Treatment,
W77-08540 5D

PHREATOPHYTES
Estimating Evapotranspiration in the North Platte Basin of Wyoming,
W77-08505 2D

PHYSICAL PROPERTIES
Continuous Automated Monitoring of Chemical and Physical Characteristics of the Red Cedar River,
W77-08110 5A

PHYTOPLANKTON
Effect of Metals on Photosynthesis of Marine Phytoplankton, (In Russian),
W77-08160 5C

Longitudinal Distribution of Selected Micronutrients in Northern San Francisco Bay During 1973,
W77-08487 5C

Phytoplankton Production and Enumeration in Northern San Francisco Bay During 1972,
W77-08488 5C

Implications of Seasonal Chemical and Physical Factors on the Production of Phytoplankton in Northern San Francisco Bay,
W77-08489 5C

PICKLE INDUSTRY
Investigation of Coagulation - Precipitation and Ultrafiltration for the Regeneration of Brines in the Cucumber Pickle Industry,
W77-08511 5D

PILOT PLANTS
Performance of Dual-Media Filters--I,
W77-08273 5D

Performance of Dual-Media Filters--II,
W77-08274 5D

Physicochemical Treatment of an Australian Municipal Waste Water,
W77-08531 5D

PIPELINES
The Protection and Repair of Underground Pipelines for Water and Sewage,
W77-08551 8G

PIPES
Perforated, Vitrified Clay Pipe Used in Peoria Facilities,
W77-08598 8G

PIPING
Plain-End Pipe 'Collars' Problem Sewer Connections,
W77-08553 8G

PLANAR AERATED JETS
The Effect of Aeration of Water Jet Spreading,
W77-08197 8B

PLANNING
Computerized Planning System for Nuclear Power Plant Evaluation,
W77-08108 6B

University Public Service Programs as They Relate to Water Resources Management in Wisconsin,
W77-08209 6E

PLANNING

RECSAD: A Computer Program for Recreation Planning,
W77-08300 6B

An Economic Appraisal of Reuse Concepts in Regional Water Supply Planning,
W77-08347 5D

Planning Challenges in the Management of Coastal Zone Water Resources,
W77-08376 6B

Seabed Sewers for Hong Kong,
W77-08555 5E

PLANT GROUPINGS

The Use of Skylab Data to Study the Early Detection of Insect Infestations and Density and Distribution of Host Plants,
W77-08422 7C

PLANT GROWTH

The Influences of Simulated Moisture Stress Conditions and Osmotic Substrates on Germination and Growth of Cultivated and Wild Safflowers,
W77-08460 2I

PLASTICS

Polyethylene Sewer Force Main Takes Varying Pressures.
W77-08549 8G

PLUVIAL CLIMATES

Pluvial Lakes of Nevada and Estimated Full Pluvial Climates,
W77-08199 2H

PLUVIAL LAKES

Pluvial Lakes of Nevada and Estimated Full Pluvial Climates,
W77-08199 2H

PODZOLS

Fulvic Acid-Metal Ion Interactions in Water,
W77-08102 5A

POINT SOURCE DISCHARGES

Standards of Performance and Pretreatment Standards for the Explosives Manufacturing Point Source Category (Proposed Rules),
W77-08113 5G

POINT SOURCES

Irrigated Agriculture: Nonpoint and Point Source Water Pollution,
W77-08116 5G

POLITICAL ASPECTS

The Environmental Problem of the Oceans: An International Stepchild of National Egotism,
W77-08367 6E

POLITICAL CONSTRAINTS

The Environmental Problem of the Oceans: An International Stepchild of National Egotism,
W77-08367 6E

POLLUTANT IDENTIFICATION

Fulvic Acid-Metal Ion Interactions in Water,
W77-08102 5A

Determination of Pyridine in Farm Crops and Fish, (In Russian),
W77-08126 5A

Comparative Examination of Enterococci Obtained from Drinking Water, Foodstuffs and Urine, (In German),
W77-08179 5A

Arsenic in Water and Fish from Lakes Hartwell, Keowee, and Jocassee, South Carolina,

Mc Cardel V Smolen (The Rights of Riparian and Nonriparian Owners to Recreational Use of Navigable Inland Lakes).
W77-08138 6E

Bank of America National Trust and Saving Association V State Water Resources Control Board (Condition Placed on Water Permit Defeated for Lack of Evidence of Necessity).
W77-08391 6E

PUBLIC HEALTH
Health Considerations in Use of Tertiary Effluents,
W77-08513 5F

Pollution Indicator Bacteria Associated with Municipal Raw and Drinking Water Supplies,
W77-08516 5A

PUBLIC PARTICIPATION
Citizen Participation in Comprehensive Water Resources Planning,
W77-08105 6B

Classification and Test of Public Participation Concepts Applied to Local Resource Planning,
W77-08295 6B

PUBLIC RIGHTS
Public Rights in Pennsylvania Waters,
W77-08362 6E

PUBLIC TRUST DOCTRINE
Public Rights in Pennsylvania Waters,
W77-08362 6E

PUERCO-ZUNI AREA (ARIZ)
Maps Showing Ground-Water COnditions in the Puerco-Zuni Area, Apache and Navajo Counties, Arizona--1975,
W77-08471 7C

PUERTO RICO
Ground Water in the San Juan Metropolitan Area, Puerto Rico,
W77-08173 4B

PULP AND PAPER INDUSTRY
Kraft Mill Recovery System,
W77-08258 5D

Effluent Limitations and Guidelines for Existing Sources and Standards of Performance and Pretreatment Standards for New Sources for the Bleached Kraft, Groundwood, Sulfite, Soda, Deink and Non-Integrated Paper Mills Segment of the Pulp, Paper, and Paperboard Point Source Category.
W77-08383 5G

Operational Considerations for the Application of Remotely Sensed Forest Data from LANDSAT or Other Airborne Platforms,
W77-08417 7C

Timber Type Separability in Southeastern United States on LANDSAT-1 MSS Data,
W77-08418 4A

PULP WASTES
Method of Purification of Waste Water By Treatment with Zirconium Salt,
W77-08255 5D

Effluent Limitations and Guidelines for Existing Sources and Standards of Performance and Pretreatment Standards for New Sources for the Bleached Kraft, Groundwood, Sulfite, Soda, Deink and Non-Integrated Paper Mills Segment of the Pulp, Paper, and Paperboard Point Source Category.
W77-08383 5G

PUMPED STORAGE
Pumped Storage Potential of the Hells Canyon Area,
W77-08196 8C

Pumped-Storage in the Pacific Northwest, An Inventory.
W77-08224 2H

Research into the Impact on Electrical Equipment from Variable Speed Operation of Pumped-Storage Plants,
W77-08492 8C

PUMPED STORAGE INVENTORIES
Pumped-Storage in the Pacific Northwest, An Inventory.
W77-08224 2H

PUMPING
Geohydrology of the Albin and La Grange Areas, Southeastern Wyoming,
W77-08176 4B

Historic Water-Level Changes and Pumpage from the Principal Aquifers of the Memphis Area, Tennessee: 1886-1975,
W77-08469 4B

PUMPING PLANTS
Sewage Pumping Station Built to Handle Future System Demands,
W77-08550 8C

PUMPS
It's Your Loss,
W77-08319 8G

Sewage Pumping Station Built to Handle Future System Demands,
W77-08550 8C

Aerobic Treatment of Liquid Wastes--With Oxygen Concentration Measured and Used to Control Pump Speed Used to Force Liquid Through Venturis.
W77-08557 5D

PYRIDINE
Determination of Pyridine in Farm Crops and Fish, (In Russian),
W77-08126 5A

PYROPHOSPHATES
Pyro- and Tripoly-Phosphate Contents of Sediments,
W77-08306 5A

QUIET TITLE
State v. Matzen (Use of Historical Maps to Settle Claims to Accretion Lands).
W77-08139 6E

RADIATION
Measurement of the Attenuation of Electromagnetic Radiation by Water in the Visible Region of the Spectrum,
W77-08293 1A

RADIO-ECHO SOUNDING
Radio-Echo Sounding of Temperate Glaciers: Ice Properties and Sounder Design Criteria,
W77-08229 2C

Radio-Echo Sounding: Reflections from Internal Layers in Ice Sheets,
W77-08230 2C

RADIO WAVES
Radio-Echo Sounding: Reflections from Internal Layers in Ice Sheets,
W77-08230 2C

RADIOACTIVE DATING
U S Geological Survey, Water Resources Division, Radiocarbon Measurements I,
W77-08169 4B

RAIN RETENTION BASINS
Design and Operation of Rain Retention Basins (Entwurf und Betrieb von Regenruckhaltebecken),
W77-08547 8A

RAINFALL
Nitrogen and Phosphorus Analyses of Rainfall at Rotorua, New Zealand,
W77-08242 5A

Recent Flash Floods of the Dison Brook (Crues Brutales Recentes Du 'Ruisseau' De Dison (Belgique): Observations Et Previsions),

SNOW COVER ANALYSIS
The AFGWC Snow Cover Analysis Model,
W77-08223 2C

SNOWMELT
Combined Ice and Water Balances of Maclure Glacier, California, South Cascade Glacier, Washington, and Wolverine and Gulkana Glaciers, Alaska, 1967 Hydrologic Year,
W77-08473 2C

SNOWPACKS
On Depth Hoar and the Strength of Snow,
W77-08239 2C

SOCIAL ASPECT
Computerized Planning System for Nuclear Power Plant Evaluation,
W77-08108 6B

SOCIAL ASPECTS
Discriminant Analysis of Characteristics Determining Acceptance or Rejection of Nuclear Power,
W77-08109 6B

Multiple Objective Planning: Small Watersheds,
W77-08350 6B

SOCIAL IMPACT
Citizen Participation in Comprehensive Water Resources Planning,
W77-08105 6B

SOCIAL PARTICIPATION
Citizen Participation in Comprehensive Water Resources Planning,
W77-08105 6B

Classification and Test of Public Participation Concepts Applied to Local Resource Planning,
W77-08295 6B

SODIUM
Effect of Some Chemical Elements on the Accumulation of Cesium-137 in Freshwater Fish, (In Russian),
W77-08322 5C

SODIUM BICARBONATE
Sodium Bicarbonate Can Settle Many Waste Water Problem Upsets,
W77-08589 5D

SOFT-WATER BOG LAKE
Benthic Microbial Community Respiration of a Soft-Water Lake,
W77-08296 2H

SOIL ANALYSIS
Fulvic Acid-Metal Ion Interactions in Water,
W77-08102 5A

SOIL CHEMICAL PROPERTIES
Root Growth, Strength, and Chemical Properties of a Hobson Fragipan,
W77-08285 2G

SOIL CONTAMINATION
A Quantitative Study of Organic Carbon Decomposition and Nitrogen Transformations in Sewage Sludge-Soil Systems,
W77-08291 5B

SOIL HORIZONS
Root Growth, Strength, and Chemical Properties of a Hobson Fragipan,
W77-08285 2G

SOIL MOISTURE
A Simulation of an Irrigation Scheduling Model Which Incorporates Rainfall Predictions,
W77-08343 3F

Growth of Tropical and Temperate Grasses at Palmerston North I. Warm-Season Yields With and Without Irrigation,
W77-08457 3F

SOIL PROFILES
Root Growth, Strength, and Chemical Properties of a Hobson Fragipan,
W77-08285 2G

SOIL STABILIZATION
Chemical and Vegetative Stabilization of Soils,
W77-08512 8D

SOIL SURVEYS
LANDSAT-1 Data, Its Use in a Soil Survey Program,
W77-08414 2G

Delineation of the Boundaries of a Buried Pre-Glacial Valley with LANDSAT-1 Data,
W77-08415 2G

SOIL TYPES
Delineation of Deciduous Wetland Forests in Northeastern Connecticut,
W77-08194 2G

SOIL WATER
Delineation of Deciduous Wetland Forests in Northeastern Connecticut,
W77-08194 2G

SOIL WATER MOVEMENT
Root Growth, Strength, and Chemical Properties of a Hobson Fragipan,
W77-08285 2G

A Water Management Model for High Water Table Soils,
W77-08301 3F

SOLID WASTES
Breaking Down Solid and Liquid Waste to Form a Fertilizer--By Inoculation with Selected Fungi and Fermentation.
W77-08559 5E

Screening Apparatus for Removal of Solids--from Sewage with Rotating Screen and Vertical Lift for Residues.
W77-08562 5D

SOLUBLE METALS WASTE REMOVAL
Removing Soluble Metals from Waste Water,
W77-08591 5D

SOLUTES
Time of Travel of Solutes in the East Fork Trinity River, November 1975; and Elm Fork Trinity River, December 1975; Trinity River Basin, Texas,
W77-08472 7C

SONOITA CREEK BASIN (ARIZ)
Determining Areal Precipitation in the Basin and Range Province of Southern Arizona - Sonoita Creek Basin,
W77-08308 2E

SOUNDING
Radio-Echo Sounding of Temperate Glaciers: Ice Properties and Sounder Design Criteria,
W77-08229 2C

SOUTH CAROLINA
A Statistical Analysis of the Mercury Concentrations in Fish from Lake Jocassee, South Carolina,
W77-08190 5A

Arsenic in Water and Fish from Lakes Hartwell, Keowee, and Jocassee, South Carolina,
W77-08191 5A

Effects of 40-Foot Charleston Harbor Project on Tides, Currents, and Salinities; Hydraulic Model Investigation,
W77-08222 2L

SOUTH CASCADE GLACIER (WASH)
Combined Ice and Water Balances of Maclure Glacier, California, South Cascade Glacier, Washington, and Wolverine and Gulkana Glaciers, Alaska, 1967 Hydrologic Year,
W77-08473 2C

SOUTH DAKOTA
LANDSAT-1 Data, Its Use in a Soil Survey Program,
W77-08414 2G

Water-Resources Investigations in South Dakota, 1976.
W77-08468 7C

Hydrologic Unit Map--1974, State of South Dakota.
W77-08476 7C

SOUTH PLATTE RIVER BASIN (COLO)
Input-Output Modeling in Water Resource System Planning,
W77-08346 6A

PERMANENT U.S. DEPT. OF INTERIOR LIBRARY

SOUTH RIVER WATERSHED (VA)
A Finite Element Model to Determine the Effect of Land-Use Changes on Flood Hydrographs,
W77-08450 8B

SOUTHEAST U.S.
Operational Considerations for the Application of Remotely Sensed Forest Data from LANDSAT or Other Airborne Platforms,
W77-08417 7C

Timber Type Separability in Southeastern United States on LANDSAT-1 MSS Data,
W77-08418 4A

SOUTHWEST U.S.
Sediment Yield and Land Use in Southwest United States,
W77-08178 4D

SOUTHWEST US
Reclamation and Use of Disturbed Land in the Southwest.
W77-08452 5G

SPAIN
Flash Floods in the Western Mediterranean (Les Crues Catastrophiques sur la Mediterranee Occidentale),
W77-08245 2E

Flash Floods in Spain (Les Crues Brutales En Espagne),
W77-08247 2E

SPECTROSCOPY
Investigation of Detection Limits for Solutes in Water Measured by Laser Raman Spectrometry,
W77-08171 2K

Spectroanalytical Parameters of Fungal Metabolites: Oosporein and Desmethoxyviridiol,
W77-08449 2K

SPINACH
Response of Oat and Spinach to Sewage Sludge Application in Soil,
W77-08495 5C

SPLIT STREAM CHEMICAL TREATMENT
Split-Stream Chemical Treatment (A Patented Process by Chemlan Company, Inc.) of Tanning Industry Waste Water,
W77-08280 5D

SPRAY IRRIGATION
Spray Irrigation of Treated Municipal Sewage Effluent and Its Effect on Chemical Properties of Forest Soil,
W77-08202 5D

SPRAYING
Application of Corrugated Sheet Sprayers for Water Purification (Die Anwendung von Wellbahnrieslern in der Wasseraufbereitung),
W77-08543 5F

SPRINGS
Digital-Model Analysis of the Effects of Water-Use Alternatives on Spring Discharges, Gooding and Jerome Counties, Idaho,
W77-08484 4B

ST THOMAS ISLAND
Floods of November 12, 1974, in the Charlotte Amalie Area, St. Thomas, U.S. Virgin Islands,
W77-08470 7C

STANDING (LEGAL)
Should Rivers Have Running. Toward Extension of the Reserved Rights Doctrine to Include Minimum Stream Flows,
W77-08372 6E

STANFORD WATERSHED MODEL
Application of Three Daily-Rainfall Runoff Models to Four Australian Catchments,
W77-08218 2A

STATE GOVERNMENTS
Water Resource Policies and Authorities, Coastal Zone Management Program Implementation,
W77-08114 6E

Sovereignty and the Control of Water Pollution,
W77-08366 5G

TEXAS UNIV. AT ARLINGTON. DEPT. OF CIVIL ENGINEERING.
Biological Treatment Kinetics of Landfill Leachate,
W77-08532 5D

TEXAS UNIV. AT AUSTIN. DEPT. OF GEOGRAPHY.
Restless River: International Law and the Behavior of the Rio Grande,
W77-08384 6E

TOPEKA WATER POLLUTION CONTROL DEPT. KANS.
Sewage Pumping Station Built to Handle Future System Demands,
W77-08550 8C

TORONTO UNIV. (ONTARIO). DEPT. OF CIVIL ENGINEERING.
Aerobic Digestion of Sludges Precipitated from Waste Water by Lime Addition,
W77-08530 5D

TORONTO UNIV. (ONTARIO). FACULTY OF LAW.
Remembering Maine: Offshore Federalism in the United States and Canada,
W77-08363 6E

TREATMENT PLANT CONTRACTS LTD., HOUNSLOW (ENGLAND).
Trends in Small Sewage Treatment Plants,
W77-08569 5D

TRW SYSTEMS AND ENERGY, REDONDO BEACH, CALIF.
Sources, Characteristics and Treatment and Disposal of Industrial Wastes Containing Hexachlorobenzene,
W77-08265 5D

TSELINOGRADSKII MEDITSINSKII INSTITUT (USSR). DEPT. OF GENERAL HYGIENE.
Sanitary and Hygienic Characteristics of Subsurface Waters of the Tselinograd and Turgai Oblasts, (In Russian),
W77-08253 5B

UNIVERSAL OIL PRODUCTS CO., DES PLAINES, ILL. (ASSIGNEE).
Precoat for Permeability Separation Systems,
W77-08259 5D

UNIVERSITY OF AGRICULTURAL SCIENCES, BANGALORE (INDIA).
A Note on the Study of Rainy Days and Wet Spells at Bijapur,
W77-08455 2B

UNIVERSITY OF EAST ANGLIA, NORWICH (ENGLAND). SCHOOL OF MATHEMATICS AND PHYSICS.
Stress in an Elastic Bedrock Hump Due to Glacier Flow,
W77-08236 2C

UNIVERSITY OF SOUTHERN CALIFORNIA, LOS ANGELES. ENVIRONMENTAL ENGINEERING DIV.
Ozone Effect of Synthetic Rubber Waste Treatment,
W77-08267 5D

UNIVERSITY OF SOUTHERN CALIFORNIA, LOS ANGELES. SCHOOL OF LAW.
Ticket to Thermidor: A Commentary on the Proposed California Coastal Plan,
W77-08379 6B

UPPSALA UNIV. (SWEDEN). INST. OF ZOOLOGY.
Lake Naivasha and Lake Nakuru: An Ecological Comparison Between Two Bird Lakes in East Africa, (In Swedish),
W77-08324 2H

UTAH STATE UNIV. DEPT. OF CIVIL AND ENVIRONMENTAL ENGINEERING.
Prediction Models of Reaeration Rate for Mountain Creeks,
W77-08501 5G

UTAH STATE UNIV., LOGAN. DEPT. OF ECONOMICS.
An Economic Appraisal of Reuse Concepts in Regional Water Supply Planning,
W77-08347 5D

VICTORIA UNIV. (BRITISH COLUMBIA). DEPT. OF GEOGRAPHY.
Planning Challenges in the Management of Coastal Zone Water Resources,
W77-08376 6B

VIRGINIA POLYTECHNIC INST. AND STATE UNIV., BLACKSBURG. DEPT. OF CIVIL ENGINEERING.
A Productivity Study of the Roanoke River Above Niagra Dam in Virginia,
W77-08333 5C

A Finite Element Model to Determine the Effect of Land-Use Changes on Flood Hydrographs,
W77-08450 8B

VIRGINIA STATE WATER CONTROL BOARD, RICHMOND. DIV. OF SURVEILLANCE AND FIELD STUDIES.
LANDSAT-1 Data as it has Been Applied for Land Use and Water Quality Data By the Virginia State Water Control Board,
W77-08432 5A

VSESOYUZNYI NAUCHNO-ISSLEDOVATELSKII INSTITUT NEFTEKHMICHESKIKH PROTSESSOV, KIEV (USSR).
The Role of Protozoa in Biological Purification of Oil Industry Sewage, (In Russian),
W77-08254 5D

WASHINGTON STATE UNIV., PULLMAN. DEPT. OF AGRICULTURAL ECONOMICS.
Economic Impacts of Controlling Water Quality in an Irrigated River Basin,
W77-08332 5G

WASHINGTON UNIV., SEATTLE. DEPT. OF ECONOMICS.
Methodology and Data for Analyzing Quantity, Quality and Economic Aspects of Minimum Streamflows, Appendices, Volume 2,
W77-08349 5G

WASHINGTON UNIV., SEATTLE. INST. OF GOVERNMENTAL RESEARCH.
Improving Institutional Arrangements for Water Development in the State of Washington: Developmental and Environmental Trade-Offs and Constraints,
W77-08284 6E

WASHINGTON UNIV., SEATTLE. SCHOOL OF LAW.
Can a State Embargo the Export of Water by Transbasin Diversions,
W77-08129 6E

WATER POLLUTION RESEARCH LAB., STEVENAGE (ENGLAND).
Improved Method for the Determination of Ethylenediaminetetraacetic Acid in Aqueous Environmental Samples by Gas-Liquid Chromatography,
W77-08521 5A

WATSON (J. D. AND D. M.) (HONG KONG).
Seabed Sewers for Hong Kong,
W77-08555 5E

WESLEYAN UNIV., MIDDLETOWN, CONN. INDUSTRIAL WASTE LAB.
Is pH Pretreatment Necessary,
W77-08276 5D

WESSEX WATER AUTHORITY, BRISTOL (ENGLAND).
Reorganizing Pollution Control in the U.K.
W77-08111 5G

WESTERN MICHIGAN UNIV., KALAMAZOO.
Beach Profile Changes: East Coast of Lake Michigan, 1970-72,
W77-08440 2J

WISCONSIN UNIV. EXTENSION, MADISON. INLAND LAKE DEMONSTRATION PROJECT.
University Public Service Programs as They Relate to Water Resources Management in Wisconsin,
W77-08209 6E

WISCONSIN UNIV. MADISON. DEPT. OF AGRICULTURAL ECONOMICS.
Diffuse Agricultural Pollution: The Economic Analysis of Alternative Controls,
W77-08329 5B

WISCONSIN UNIV. -MADISON. DEPT. OF CIVIL AND ENVIRONMENTAL ENGINEERING.
Selective Withdrawal and Heated Water Discharge: Influence on the Water Quality of Lakes and Reservoirs Part I - Selective Withdrawal,
W77-08447 5G

WISCONSIN UNIV. MADISON. DEPT. OF LANDSCAPE ARCHITECTURE.
Classification and Test of Public Participation Concepts Applied to Local Resource Planning,
W77-08295 6B

WISCONSIN UNIV., MADISON. INST. FOR ENVIRONMENTAL STUDIES.
Trophic Status of Inland Lakes from LANDSAT,
W77-08434 5A

WISCONSIN UNIV. MIDDLETON. GEOPHYSICAL AND POLAR RESEARCH CENTER.
Radio-Echo Sounding: Reflections from Internal Layers in Ice Sheets,
W77-08230 2C

WYOMING UNIV., LARAMIE. COLL. OF LAW.
New Water Legislation--Drafting for Development, Efficient Allocation and Environmental Protection,
W77-08188 6E

Water for Food - Or for More Important Purposes. (Reallocation of Irrigation Water to Cities and Industries),
W77-08377 6E

WYOMING UNIV., LARAMIE. DEPT. OF AGRICULTURAL ENGINEERING.
Estimating Evapotranspiration in the North Platte Basin of Wyoming,
W77-08505 2D

WYOMING UNIV., LARAMIE. WATER RESOURCES RESEARCH INST.
Inventory of Water Resources Research at the University of Wyoming, Fiscal Year 1975,
W77-08506 9A

LIBRARY U. OF I. URBANA-CHAMPAIGN

SELECTED WATER RESOURCES ABSTRACTS

VOLUME 10, NUMBER 18
SEPTEMBER 15, 1977

W77-08601 -- W77-09100
CODEN: SWRABW

LIBRARY U. OF I. URBANA-CHAMPAIGN

SELECTED WATER RESOURCES ABSTRACTS is produced by the Office of Water Research and Technology, U.S. Department of the Interior, and published twice monthly by the National Technical Information Service (NTIS), U.S. Department of Commerce, for the Water Resources Scientific Information Center (WRSIC).

SELECTED WATER RESOURCES ABSTRACTS (SWRA) is available to Federal agencies and their contractors or grantees in water resources research upon request, citing contract or grant number and sponsoring agency. Write: Manager, Water Resources Scientific Information Center, Office of Water Research and Technology, U.S. Department of the Interior, Washington, DC 20240.

Some documents abstracted in this journal can be purchased from NTIS. Price codes are given in the entries and a current code-price conversion table is attached to the outside back cover. Other documents are available from originating organizations or authors as indicated in the citation.

SELECTED WATER RESOURCES ABSTRACTS is also available on subscription from NTIS, 5285 Port Royal Road, Springfield, VA 22161. Annual subscription rates for the North American Continent are: SWRA Journal only, $75; Journal and Annual Indexes, $100; Indexes only, $50. Other addressees, write prices.

SELECTED WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center, Office of Water Research and Technology, U.S. Department of the Interior

VOLUME 10, NUMBER 18
SEPTEMBER 15, 1977

W77-08601 – W77-09100

Secretary of the U.S. Department of the Interior has determined that the publication of this periodical is necessary in the transaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through August 31, 1978.

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.

LIBRARY OF THE UNIVERSITY OF ILLINOIS

FOREWORD

elected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent nographs, journal articles, reports, and other publication mats. The contents of these documents cover the water-ated aspects of the life, physical, and social sciences as ll as related engineering and legal aspects of the charac-istics, conservation, control, use, or management of water. ch abstract includes a full bibliographical citation and a set descriptors or identifiers which are listed in the **Water sources Thesaurus.** Each abstract entry is classified into fields and 60 groups similar to the water resources re-arch categories established by the Committee on Water sources Research of the Federal Council for Science and chnology.

RSIC IS NOT PRESENTLY IN A POSITION TO PROVIDE OPIES OF DOCUMENTS ABSTRACTED IN THIS JOUR-AL. Sufficient bibliographic information is given to enable aders to order the desired documents from local libraries other sources.

lected Water Resources Abstracts is designed to serve e scientific and technical information needs of scientists, gineers, and managers as one of several planned services the Water Resources Scientific Information Center RSIC). The Center was established by the Secretary of the erior and has been designated by the Federal Council for ience and Technology to serve the water resources com-unity by improving the communication of water-related search results. The Center is pursuing this objective by co-dinating and supplementing the existing scientific and tech-al information activities associated with active research d investigation program in water resources.

provide WRSIC with input, selected organizations with tive water resources research programs are supported as enters of competence" responsible for selecting, abstract-ing, and indexing from the current and earlier pertinent literature in specified subject areas.

Additional "centers of competence" have been established in cooperation with the Environmental Protection Agency. A directory of the Centers appears on the inside back cover.

Supplementary documentation is being secured from established discipline-oriented abstracting and indexing services. Currently an arrangement is in effect whereby the Bio-Science Information Service of Biological Abstracts supplies WRSIC with relevant references from the several subject areas of interest to our users. In addition to Biological Abstracts, references are acquired from Bioresearch Index which are without abstracts and therefore also appear abstractless in SWRA. Similar arrangements with other producers of abstracts are contemplated as planned augmentation of the information base.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Research and Technology and other Federal water resource agencies with which the Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangements of this bulletin are welcome.

SUBJECT FIELDS AND GROUPS

Please use the edge index on the back cover to locate Subject Fields and Indexes.

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Nonwater Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

POINT STOCHASTIC ANALYSIS OF DAILY RAINFALL OCCURRENCE WITH APPLICATION TO INDIANA,
Purdue University, West Lafayette, Indiana.
M. L. Kavvas.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-269 006, Price codes: A10 in paper copy, A01 in microfiche. Ph.D. Thesis, May 1975. 190 p, 14 tab, 6 ref, 3 append. OWRT B-036-IND(6).

Descriptors: *Rainfall, *Stochastic processes, *Indiana, *Statistical models, Statistical tests, Probability, *Model studies.
Identifiers: *Rainfall occurrences, *Cyclicity, Stochastic analysis, Stochastic models, Poisson method.

The point stochastic analysis of daily rainfall occurrences in Indiana is discussed. The point statistical analysis was performed utilizing some statistical functions and some statistical tests of hypotheses. First, the analysis of trends in the daily rainfall counting process was performed. There are cyclicities both in the first and the second moments of the point stochastic process. Physicaly meaningful annual and 15-day cycles were significant. There is also a slight downward trend in the rate of daily rainfall occurrence in Indiana. The data were homogenized under the independent counting increments assumption and the Poisson model was tested by formal statistical tests and by statistical functions. The model was rejected for the daily rainfall counting process in Indiana. From the behavior of the spectrum and the variance-time function of the daily rainfall counts a clustering of the daily rainfalls in terms of storms is apparent. The Neyman-Scott cluster process was constructed in the time dimension to model this physical dependence. Physical concepts were attached to various components of the model. The model fits the data quite well. Due to its very flexible spectral structure and to its physical interpretation of the various components of the rainfall occurrence, Neyman-Scott cluster model deserves further investigation in different climates of the world.
W77-08935

2C. Snow, Ice, and Frost

SNOWMELT: A TWO-DIMENSIONAL TURBULENT DIFFUSION MODEL,
Canterbury Univ., Christchurch (New Zealand).
R. N. Weisman.
Water Resources Research, Vol. 13, No. 2, p 337-342, April 1977. 7 fig, 2 tab, 18 ref.

Descriptors: *Snowmelt, *Heat transfer, *Diffusion, *Turbulent flow, *Model studies, Mathematical models, Winds, Heat, Latent heat, Melting, Snowpacks, Water vapor, Humidity, Temperature, Turbulence, Melt water.
Identifiers: *Turbulent diffusion models.

The melt from a ripe snowpack due to sensible and latent heat flux was considered. The problem is two-dimensional; the snow field has a well-defined leading edge. The equations that describe the airflow over the snow are the conservation of momentum, sensible heat, and water vapor. The turbulent diffusion is formulated by semi-empirical turbulence theory. The solution showed the manner in which the point melt varies downwind from the landing edge, and the average melt varies with the fetch of the snowpack for varying degrees of atmospheric stability conditions. The results indicated that a reasonably accurate estimate of total melt can be achieved by using the one-dimensional formulae with temperature, humidity, and velocity measurements taken over the central part of the snow field. (Sims-ISWS)
W77-08823

WATER AND ICE POTENTIALS IN FROZEN SOILS,
Guelph Univ. (Ontario). Dept. of Land Resource Science.
P. H. Groenevelt, and B. D. Kay.
Water Resources Research, Vol. 13, No. 2, p 445-449, April 1977. 3 fig, 19 ref.

Descriptors: *Frozen soils, *Moisture content, *Ice, *Model studies, Mathematical models, Porous media, Soils, Soil water, Voids, Hysteresis, Temperature, Freezing, Frozen ground, Frost, Frost action.

The envelope pressure potentials of the liquid water and ice in a frozen soil were defined. The envelope pressure potential of liquid water is a generalization of the definition of the envelope pressure potential (overburden potential) of the water in an unfrozen swelling soil. In order to express the envelope pressure potentials in terms of volume ratios, use was made of the void ratio, the moisture ratio equivalent, and the ice ratio equivalent. A new development was initiated by the formulation and derivation of the frost potential of both the liquid water and the ice. These frost potentials were expressed in terms of the ice ratio, the moisture ratio, the ice ratio equivalent, and the moisture ratio equivalent. The relations between these variables are intrinsic properties of the porous medium which have to be determined experimentally. (Sims-ISWS)
W77-08828

WAS THERE A LATE-WURM ARCTIC ICE SHEET,
Maine Univ. at Orono. Dept. of Geological; and Maine Univ. at Orono. Inst. for Quaternary Studies.
T. Hughes, G. H. Denton, and M. G. Grosswald.
Nature, Vol 266, No 5603, p 596-602, April 14, 1977. 4 fig, 1 tab, 46 ref.

Descriptors: *Glaciers, *Ice, *Arctic, *Antarctic, Geomorphology, Glaciation, Icebergs, Movement, Water levels, Glaciology.
Identifiers: *Ice sheets, Ice domes, Ice shelves, Ice streams, Calving bays.

A simplification and synthesis of late-Wurm Northern Hemisphere glaciation is possible by postulating an Arctic Ice Sheet that behaved as a single dynamic system. (Sims-ISWS)
W77-08839

STUDY OF AN ICE CORE TO THE BEDROCK IN THE ACCUMULATION ZONE OF AN ALPINE GLACIER,
Centre National de la Recherche Scientifique, Grenoble (France). Laboratoire de Glaciologie.
M. Vallon, J-R. Petit, and B. Fabre.
Journal of Glaciology, Vol 17, No 75, p 13-28, 1976. 12 fig, 30 ref, append.

Descriptors: *Glaciers, *Ice, *Stratigraphy, *Cores, Glaciology, Firn, Crystals, Cryology, Density, Ablation, On-site investigations, Physical properties, Optical properties, Cold regions, Permeability, Analysis.
Identifiers: *Alpine glaciers, Temperate glaciers, Foliation.

A water table appearing every summer where the ice begins, at a depth of approximately 30 m, ac-

celerates the transformation of firn into ice during the summer (80% of the ice formed every year appears in less than 2 months). The ice formed in the mentioned way contains from 0 to 0.6% water. The average water content increases gradually with the depth because of the heat of deformation. But, near bedrock, between 180 and 187 m, the permeability of the blue ice is such that the water content drops (0.3% as compared to 1.3% between 160 and 180 m). From a depth of 33 m, a foliation of sedimentary origin gradually develops in the ice. Foliation dip increases regularly to a depth of 145 m. At 145 m, foliation jumps suddenly from 20 deg to 40 deg, then at 170 m from 40 deg to 65 deg, which can be explained by old modification in the bergschrund. The foliation disappears near bedrock (180-187 m), where there are no bubbles in the ice. The average size of an ice crystal increases slowly in the firn, shows seasonal fluctuations between 30 and 50 m, then jumps from a diameter of 1 or 2 mm to 10 or 20 mm between 50 and 80 m. Between 180 and 187 m, the ice is made of large crystals (3-10 cm diamter; the figure, however, probably is inexact due to a recrystallization of the samples). The very strong sub-vertical orientation of the optic axes of the firn crystals disappears quickly, and from 66 m on, in ice with large crystals, a fabric of multiple maxima appears (generally, 3 or 4 directions, forming a triangle or a rhombus). On the other hand, in the small crystals that form bands parallel to the plane of foliation, only one direction of preferential orientation can be seen, or two close to one another. Crystals of intermediate size (10 to 50 mm) generally have two directions of preferred orientation at an angle of approximately 50 deg to one another. No matter how big the crystals are, the angle between the most common c-axis orientation and the vertical does not change from 60 to 170 m depth. (Humphreys-ISWS)

THE MAXIMUM EXTENT OF GLACIERS IN PART OF WEST FALKLAND,
Aberdeen Univ. (Scotland). Dept. of Geography.
C. M. Clapperton, and D. E. Sugden.
Journal of Glaciology, Vol. 17, No. 75, p 73-77, 1976. 4 fig, 7 ref.

Descriptors: *Glaciation, *Geomorphology, *On-site investigations, *Glaciers, Cirques, Exploration, Evaluation, Glacial drift, Till, Topography, Pleistocene epoach.
Identifiers: *Falkland Islands.

Although it is known that cirque glaciers once existed in the Falkland Islands, it has remained in doubt whether or not the islands were ever covered by ice caps or an ice sheet during the Cainozoic. This paper scrutinized geomorphological evidence on the southeastern flank of a high massif in West Falkland. It was suggested that, at the time of their maximum extent in the Cainozoic, the largest glaciers were no more than 2.7 km long. Unless the raised beaches are later shown to be related to glacio-isostatic movements within the Falkland Islands, it is reasonable to conclude that, at the time of the maximum extent of glaciers in West Falkland, ice did not extend beyond the cirques and the upper reaches of associated valleys. (Humphreys-ISWS)
W77-09032

AN EXPERIMENTAL STUDY OF THE MOTION OF ICE PAST OBSTACLES BY THE PROCESS OF REGELATION,
Bristol Univ. (England). H. H. Willis Physics Lab.
E. M. Morris.
Journal of Glaciology, Vol. 17, No. 75, p 79-98, 1976. 10 fig, 1 tab, 17 ref.

Descriptors: *Glaciers, *Ice, *Movement, *Laboratory tests, Glaciology, Freezing, Melting, Velocity, Theoretical analysis, Laboratory equipment, Viscometers, Temperature.
Identifiers: *Basal sliding, *Regelation, Temperate glaciers.

The results of regelation experiments, in which a single object is pulled through ice, cannot be applied directly to the problem of basal sliding in glaciers becasuse the two systems have different geometries. When the force applied to a single object is small, impurities trapped in the regelation water layer around the object inhibit the regelation process. At larger forces, above the Drake-Shreve transition point, impurities are shed in a trace behind the object. However, when ice moves over a series of obstacles, a trace may exist above and below the transition point. The regelation velocity below the transition point is not reduced by the effect of trapped impurities. In an experiment in which brass cylinders of various cross-sections rotate in ice, the ratio between the expected regelation velocity, calculated using the basal-sliding theory of Nye, and the measured regelation velocity is 8+ or - 2, both above and below the transition point. The same ratio has been obtained by other workers with wires of similar thermal conductivity above the transition point. Measurements of temperature differences indicate that supercooling cannot be the main source of the unexpectedly low regelation velocities above the transition point. (Humphreys-ISWS)

2D. Evaporation and Transpiration

ASPECTS OF THE DAILY AND SEASONAL COURSE OF TRANSPIRATION INTENSITY IN MEADOW PLANTS, (IN RUSSIAN),
Leningrad State Univ. (USSR).
L. N. Alekseenko.
Bot Zh (Leningr) 60(12); p 1740-1749, 1975.

Descriptors: *Transpiration, *Variability, *Fluctuations, Vegetation, Cycles, Water supply, Plant physiology, Biorhythms.
Identifiers: *Meadow plants, *Transpiration intensity, USSR.

During a plentiful water supply, daily changes in transpiration intensity (TI) corresponded, in 30 meadow species, to environmental changes. TI increased from morning to noon, reached a maximum in the early afternon and decreased toward evening. Highest TI was often observed in mid-morning and sometimes in the late afternoon. TI curve may have 2 peaks with a midday depression or more than 2 peaks. The changes in TI during an adequate water supply indicated that transpiration rates were determined by plant physiology and not by environment during some hours of the day. A similar conclusion was reached in reference to TI variations during the vegetative period. In the majority of species, the seasonal course of TI was asymetric, reaching a maximum at the beginning of heading and budding with a gradual decrease until fruit and seed ripening.

TRANSPIRATION INTENSITY OF MEADOW PLANTS, (IN RUSSIAN),
Leningrad State Univ. (USSR).
L. N. Alekseenko.
Bot Zh (Leningr) 60(10), p 1456-1466, 1975.

Descriptors: *Transpiration, Vegetation, Water utilization, Consumptive use.
Identifiers: Hygrophytes, Meadow plants, Eumesophyte, Intensity, Hygromesophytes.

The transpiration intensities (TI) of 41 spp. of primarily meadow plants are given. A small group of species with an average TI of < 0.60 g.h/g fresh weight was distinguished. The majority of meadow plants have an average TI from 0.60-0.90 and spp. from 0.90-1.47 g.h/g fresh weight. The majority of the plants species consume about 95-110% of the water supply in the leaves per hour, and during daylight it is renewed 20-22 times. There are no statistically significant differences with respect to the average TI between eumesophytes, hygromesophytes and hygrophytes. No correlation was found between TI and size and shape of the leaf blade.

EVAPORATION FROM SEVEN RESERVOIRS IN THE DENVER WATER-SUPPLY SYSTEM, CENTRAL COLORADO,
Geological Survey, Reston, Va. Water Resources Div.; and Geological Survey, Lakewood, Colo.
J. F. Ficke, D. B. Adams, and T. W. Danielson.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-265 323. Price codes: A09 in paper copy, A01 in microfiche. Water-Resources Investigations 76-114, April 1977. 170 p, 48 fig, 15 tab, 15 ref.

Descriptors: *Evaporation, *Reservoirs, *Colorado, Data collections, Analytical techniques, Energy budget, Mass transfer, Evaporation pans, Evaluation, Water supply.
Identifiers: Central Colorado.

Seven reservoirs in central Colorado, operated by the Denver Board of Water Commissioners, were studied during 1967-73 to determine evaporation losses. These reservoirs, Elevenmile Canyon, Dillon, Gross, Antero, Cheesman, Williams Fork, and Ralston, are located on both sides of the Continental Divide. Methods for computing evaporation include energy-budget, mass-transfer, and pan relationships. Three reservoirs, Elevenmile Canyon, Dillon, and Gross, had mass-transfer coefficients calibrated by energy-budget studies. At the remaining reservoirs, an empirical technique was used to estimate the mass-transfer coefficient. The enery-budget-calibrated methods give the most accurate evaporation values; the empirical coefficients give only a best estimate of evaporation. All reservoirs should be calibrated by energy-budget studies. The pan method of computing evaporation is the least reliable method because of problems of advected energy through the sides of the pan, representative pan exposure, and the irregularity of ratios of reservoir to pan evaporation. (Woodard-USGS)

2E. Streamflow and Runoff

FLOODS IN THE BIG CREEK BASIN, LINN COUNTY, IOWA,
Geological Survey, Iowa City, Iowa. Water Resources Div.
A. J. Heinitz.
Open-file report 77-209, January 1977. 35 p, 8 fig, 5 tab, 4 ref.

Descriptors: *Floods, *Flood data, *Flood profiles, *Flood recurrence interval, *Streamflow, Flow rates, Peak discharge, State-discharge relations, Flood frequency.
Identifiers: *Linn County(Iowa), *Big Creek basin.

Flood information for the Big Creek basin in Linn County, Iowa, should be of use to those concerned with the design of bridges and other structures on the flood plains of the streams. Water-surface profiles for the flood of May 1974 are given for Big Creek and its major tributaries, East Big, Crabap-

LIBRARY U. OF I. URBANA-CHAMPAIGN

ple, Elbow, and Abbe Creeks. The May 1974 flood was at least a 50-year flood on East Big Creek and along certain reaches of Big and Abbe Creeks. Also included for Big Creek are a profile of the December 1971 medium-stage flow and a partial profile for the minor flood of July 1971. Profiles for the low-water condition of October 26, 1972, are shown for all reaches. Water-surface profiles for the 25- and 50-year floods are estimated in relation to the May 1974 flood. MISSOURI STREAM AND SPRINGFLOW CHARACTERISTICS LOW-FLOW FREQUENCY AND FLOW DURATION,
Geological Survey, Rolla, Mo. Water Resources Div.
J. Skelton.
Missouri Department of Natural Resources, Geological Survey, Rolla, Water Resources Report No 32, 1976. 71 p, 24 fig, 1 plate, 5 tab, 13 ref.

Descriptors: *Low flow, *Statistical methods, *Low-flow frequency, *Flow duration, *Missouri, Hydrologic data, Streamflow, Flow rates, Regulated flow, Seepage, Droughts.

A statistical analysis of low-flow information for Missouri streams contains low-flow frequency data for 460 continuous- and partial-record gaging stations, discharge measurements and approximate frequency data for 66 partial-record stations, and flow-duration data for 84 long-time continuous-record stations. Maps showing seepage-run data collected in Ozarks basins are included to supplement tabulated frequency information from the gaging stations and to permit extrapolation of these frequency data to many additional sites. Low-flow characteristics of streams vary among physiographic regions in Missouri. The low-flow potential of most Plains streams is poor because of the low hydraulic conductivity of the clays and shales in the area. Storage reservoirs are required for effective utilization of surface-water supplies in this region. Ozark streams generally have the best sustained low flows in the state because of groundwater inflow from extensive natural reservoirs in the soluble carbonate rocks, but this pattern is not consistent in the region. The solution cavities result in water losses and nonconformance to areal patterns in some basins. Low flows in the Southeastern Lowlands are second in magnitude to those of the Ozarks because of groundwater inflow from the extensive alluvial aquifer. (Woodard-USGS)

SOME COMPUTATIONAL ASPECTS OF ONE- AND TWO-DIMENSIONAL UNSTEADY FLOW SIMULATION BY THE METHOD OF CHARACTERISTICS,
Geological Survey, Reston, Va. Water Resources Div.
C. Lai.
In: International Symposium on Unsteady Flow in Open Channels, held at University of Newcastle-upon-Tyne, England, April 12-15, 1976: BHRA Fluid Engineering, Cranfield, Bedford, England, p D1-1 - D1-12, 1976. 5 fig, 1 tab, 12 ref.

Descriptors: *Model studies, *Open channel flow, *Unsteady flow, *Numerical analysis, *Computer models, Mathematical models, Analytical techniques, Input-output analysis, Evaluation, Correlation analysis.
Identifiers: *Method of characteristics, One-dimensional flow, Two dimensional flow, Specified-time-interval scheme.

The method of characteristics is well suited to the simulation of one-dimensional, unsteady, open-channel flow. When a numerical scheme based upon specified time intervals is employed, one can solve the characteristics equations to second-order accuracy by the trapezoidal rule using iteration, or by applying an extrapolation procedure to two sets of linear computations using two different sizes of time interval. Numerical experiments showed virtually the same results for the two techniques. The second technique, however, is preferred for it generally consumes less computer time, and offers the option of selecting first- or second-order results. In attempting to extend the method of characteristics to two-dimensional flow in a wide river, or embayment, one finds a number of dissimilarities as well as similarities between the two cases. Many favorable features of the method of characteristics for one-dimensional flow are lost in the two-dimensional case, thus complicating the flow computation. Again, if the specified-time-interval scheme is used, second-order results may be obtained by the trapezoidal rule with iteration, or by the extrapolation procedure applied to two linear systems. However, the iteration technique in the two-dimensional flow is extremely cumbersome and solution - despite many favorable results - is not always successful. The latter offers an advantage of requiring no iteration, but it requires more memory. (Woodard-USGS)

Interest in stream temperature prediction stems largely from concern for the possible deleterious environmental consequences of thermally polluted surface waters. Stream temperature is an important determinant of the solubility fo dissolved gases, biological reaction kinetics, the distribution of fish and lower forms of aquatic life, and the efficiency of water treatment for domestic and industrial use. Th epaper described the Hynamic Stream Temperature Model (DSTEMP). The model is suitable for prediction of stream temperatures over a diurnal cycle and over extended periods of time. The DSTEMP model can be used for unsteady flow conditions by linkage with a dynamic streamflow routing model (DNRT). Alternatively, steady flow conditions may be specified. Data requirements are realistic in terms of data types usually collected by the National Weather Service, NOAA, and the United States Geological Survey. In addition to describing the model, an application of DNRT-DSTEMP to the Brazos-Little Rivers, Texas, was included to illustrate that the models provide a practical tool for streamflow-stream temperature forecasting. Identifiers: *Backwater models, *Hydraulic transform graphs, Water surface profiles.

Any gradually varied flow computation requires the solution of the energy and continuity equations. To this end, many techniques are available. For prismatic channels, the Direct Step Method gives a result without requiring iteration. However, for nonprismatic channels, it is necessary to resort to some variation of the Standard Step Method, thereby requiring some iterative procedure. A graphical solution, using a simple program to construct a set of curves, can eliminate iteration as well as retain flexibility with regard to flow variations along the reach. To accomplish this, a graphical solution of the energy equation was presented which uses hydraulic transform graphs for river cross sections along a reach. (Lee-ISWS)

Identifiers: *Multivariate distributions.

It is assumed that the river runoff process can be approximated by a Markov process. The process is described by M distribution functions. Fundamental hypothesis of relations between multivariate distributions and corresponding maginal distributions was given. A finite difference scheme for multisite and multilag generation of river runoff was derived. The derivation is based on the multivariate normal distribution. Different methods of determination of the order of the finite difference scheme were discussed as well as the influence of model order and method of parameter estimation on properties of the model. GROUND WATER BUDGET OF THE MOUNTAINOUS REGIONS OF HUNGARY, (IN HUNGARIAN),
Hungarian State Geological Inst., Budapest.
L. Szebenyi.
Magy All Foldtani Intez Evi Jel. 1971; p 221-228, 1973.

Descriptors: *Groundwater, Europe, Mountains, Infiltration, *Groundwater basins, *Base flow, *Karst hydrology, *Water yield, Mountains, Ephemeral streams, Karst, Hydrogeology.
Identifiers: *Hungary.

The dynamic ground water reserves of Hungary's basins were calculated in profiles plotted on the basin margins. The ground water reserves communicating through filtration in these profiles are complemented with the surplus of the infiltrated waters returning to the surface within the confines of the mountains. The quantity of ground waters infiltrating in the mountainous regions and returning to the surface in one and the same region is defined by the base flow of the water-courses. In Hungary, on the basis of the data so far available, this base flow is best characterized by the Aug. discharge of 85% frequency. Dividing this by the corresponding drainage area, one can obtain the hydrogeological characteristics of the region. Values higher than 150m3/day/km2 are characteristic of Mesozoic karstic areas; 50 to 150m3/day/km2 are uncharacteristic, occurring in areas of insignificant size; 21-50m3/day/km2 are characteristic of the Oligocene-Miocene areas of NE Hungary and of some volcanic zones; 10-20m3/day/km2 are most characteristic of the internal parts of most of the mountainuous regions, areas least-covered by Pleistocene; 10-15m3/day/km2 are characteristic of the less elevated parts of these regions, areas carrying a comparatively thicker loess-and-loam (red clay) overburden. Drainage basins having a module lower than 9m3/day/km2 occur on the margins of the mountains, where the debris cones appear. These data are characteristic of the drier late-summer period. In addition to this, the potential winter accumulation of water reserves in karstic areas is considerable, where winter accumulation attains about one and the half of the base flow yield.--Copyright 1974, Biological Abstracts, Inc.

Identifiers: *Regime dominance, *System efficiency, *Lake environments, Snake Lake Rehabilitation Project, Upper Great Lakes Regional Commission, Lake management.

Hydrogeologic information is not conventionally given adequate attention in planning and managing lake resources. The ground water regime in the vicinity of lakes is often unknown. The authors chose to study the hydrogeology in the glaciated, temperate states in the U.S. The objectives of the paper are: compile available hydrogeologic information; describe hydrogeologic aspects of lakes emphasizing ground water/surface water relationships; specify and classify critical hydrogeologic informational needs for evaluating lake environments; and show the utility of hydrogeological information for lake management and development activities. Hydrogeologic factors needed to assess lake environments are; regime dominance (relative magnitude of ground water in a lake's water intake); system efficiency (the rate of ground water/lake interchange); and position of a lake within a ground-water flow system. The Snake Lake rehabilitation project in northern Wisconsin and the planning of a recreational new town in northwestern Wisconsin illustrate the application of lake/ground-water information. LIBRARY U. OF I. URBANA-CHAMPAIGN

he city of Modesto encompasses about 12 square iles in the northeastern part of the San Joaquin alley, Calif. The ground-water model encomasses about 542 square miles. In the Modesto rea, ground water occurs in an unconfined quifer a confined aquifer. both of which are comosed of unconsolidated materials, and a conolidated-rock aquifer. Only the unconfined quifer was modeled, using several simplifying assumptions concerning hydrologic conditions in the round-water basin. A program is used that comutes the net rate of recharge and discharge under teady-state conditions. The model was then odified until reasonable values of recharge and ischarge were computed. Testing of the model indicated that simulated water levels were especially ensitive to tansmissivity, storage coefficient, irigation return, and riverbed hydraulic conductivi-y; amond the parameters that affected water evels least were the vertical hydraulic conductivi-y and specific storage of the confining bed, the o-called E-clay. Descriptors: *Groundwater, *Groundwater movement, *Water wells, *Model studies, Mathematical models, Drawdown, Wells, Water levels, Water table, Flow, Aquifers, Screens, Well screens, Permeability, Anisotropy, Pumping, Computer models.

A digital simulation model for the steady-state radial flow towards partially penetrating wells in the alluvial plains was presented. As the deposits in these plains are heterogenous with several good water-bearing formations crisscrossed with silty layers, the deposits were treated as a single anisotropic aquifer with water table conditions prevailing. The iterative alternate direction implicit technique was used for the solution of the steady-state flow. The digital simulation model was used to study the effects of anisotropy, screen setting, and screen length on the discharge per unit length of screen. The model also was used to evaluate the errors involved in determining lateral permeability from distance-drawdown data. The digital simulation model was applied to field pumptest data for purposes of identification of aquifer anisotropy and radius of influence of well; and the model was used in evaluation of errors in determining lateral permeability from distance-drawdown data. SEEPAGE UNDER STRUCTURE ON N STRATA OF SOIL,
Missouri Univ.-Columbia. Dept. of Civil Engineering.
C. W. Lenau.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol. 103, No. HY5, Proceedings Paper 12911, p 483-497, May 1977. 4 fig, 2 tab, 2 ref, 4 append.

Descriptors: *Underseepage, *Stratification, *Hydraulic structures, *Mathematical models, Equations, Groundwater movement, Underflow, Seepage, Permeability, Aquifers, Confined water, Artesian heads, Dams.
Identifiers: Boundary conditions.

A solution was developed for the discharge under a structure resting on N srrata of equal thickness. The solution was an asymptotic approximation of the exact solution for large values of the structure length. However, because neglected terms are exponentially small, the solution is accurate for a very wide range of conditions. Because successive strata can have equal permeability, the solution can be applied to almost any combination of strata thicknesses and permeabilities. (Visocky-ISWS)

SHAPE OF A STREAMLINE WATER TABLE NEAR INFLOW AND OUTFLOW BOUNDARIES,
Illinois Univ. at Urbana-Champaign. Dept. of Agronomy.
C. W. Boast.
Water Resources Research, Vol 13, No 2, p 325-328, April 1977. 3 fig, 1 tab, 12 ref.

Descriptors: *Water table, *Shape, *Boundaries(Surfaces), *Flow nets, Mathematical models, Inflow, Discharge, Slopes, Equations, Graphical analysis, Dupuit-Forchheimer theory, Dams.
Identifiers: Streamlines, Hodographs.

A streamline water table usually is pictured to leave an inflow boundary perpendicular to the surface and to approach an outflow boundary tangential to the surface for vertical surfaces or for inclined surfaces with the porous medium 'below' the surface. The hodograph solution for the problem of flow through a vertical walled dam proved that, theoretically, the water table streamline leaves the inflow boundary horizontally and approaches the outflow boundary vertically. However, the solution shows that at a practical scale the water table meets the boundaries at finite nonzero slopes. The actual water table shape deviates considerably from the usual way that the water table is sketched. The cause of the difference lies in an intuitive but incorrect assumption that the slope of the water table does not change dramatically near the endpoints of the water table. (Visocky-ISWS)

S. R. Singh, and C. M. Jacob.
Water Resources Research, Vol 13, No 2, p 411-419, April 1977. 3 fig, 1 tab, 16 ref.

Descriptors: *Aquifers, *Groundwater movement, *Hydrodynamics, *Model studies, Mathematical models, Groundwater, Channels, Hydraulic conductivity, Water table, Water levels, Precipitation(Atmospheric), Infiltration, Recharge, Withdrawal, Hydraulics.

The unsteady-state flow of water through an unconfined aquifer can be represented by the Boussinesq equation. The nonlinear term involving the highest derivative in this equation was approximated by a linear term, and the resulting ap-

proximate Bossinesq was linearized to a Fokker-Planck equation by the method of functional transformation. Solutions to the problem of groundwater flow through phreatic aquifers lying between (1) constant water level boundaries and (2) variable water level boundaries were obtained from the general solution of the Fokker-Planck equation for constant and variable rates of recharge and withdrawal. Variable rates of recharge and withdrawal were approximated by periodic step functions which represented two different rates, one each for both rainy and dry seasons. Variable water levels in the open channels were approximated by step functions, and the initial condition was represented by straight line segments. An analytical solution of the approximate Boussinesq equation was compared with the finite difference solution of the original Boussinesq equation. The difference between the two solutions was almost negligible, and therefore, the applicability of the analytical solutions to groundwater resource management was established. The effect of variable water level boundaries on groundwater dynamics was studied by performing a sample calculation. (Sims-ISWS)

GROUND WATER MODEL FOR THE ISLAND OF ANHOLT, DENMARK,
Roskilde Univ. Center. (Denmark).
N. Schroder, and H. Obro.
Nordic Hydrology, Vol. 7, No. 5, p 281-292, 1976. 11 fig, 6 ref.

Descriptors: *Groundwater, *Groundwater movement, Islands, *Model studies, Mathematical models, Saline water-freshwater interfaces, Recharge, Withdrawal, Groundwater recharge, Infiltration, Precipitation(Atmospheric), Sewage, Foreign countries, Foreign research, Cesspools, Geology, Hydrology, *Computer models.
Identifiers: *Anholt Island(Denmark), *Denmark, *Groundwater models.

The development and application of a digital computer model of the groundwater reservoir of the island of Anholt were described. The model was based on a finite difference, two-dimensional approach. It was used successfully to investigate if the groundwater at a planned well field might be polluted by sewage from nearby cesspools. Although the model was an approximation of the real aquifer conditions, the model was very useful, and it was suggested that modelling techniques be more widely used in groundwater resource investigations. Descriptors: *Groundwater movement, *Analog models, *Arizona, *Mexico, *International Bound and Water Comm, Groundwater resources, Aquifers, Pumping, Water utilization, Irrigation, Water supply, Water demand, Projections, Groundwater availability.
Identifiers: *Yuma area(Ariz).

An electric analog model was used to simulate the ground-water system of the Yuma area, Arizona, and to predict the magnitude of southwesterly flow of ground water across the limitrophe section of the Colorado River. An evaluation of alternative ground-water recovery plans indicated that there would be little effect on the flow across the limitrophe section but a substantial decrease in flow across the Arizona-Sonora international boundary. Identifiers: *Walworth County(Wis).

In Walworth County, Wis., good-quality water is available from the sand-and-gravel, Niagara, Galena-Platteville, and sandstone aquifers. Yields of more than 1,000 gallons per minute are available from glacial drift where it contains a sufficient thickness of saturated sand and gravel. The Niagara aquifer is a dolomite that occurs in the eastern fourth of the county. It is capable of yielding over 100 gallons per minute. The Galena-Platteville aquifer is also a dolomite, but occurs in the west half of the county. It is capable of yielding over 500 gallons per minute. The sandstone aquifer underlies the entire county and is capable of yielding 1,000 gallons per minute to wells in the county. The sand-and-gravel and sandstone aquifers are the principal sources of municipal water. The chemical quality of water from the four aquifers is similar. Median values for hardness and dissolved solids range from 300 to 350 milligrams per liter. Iron and manganese are present in bothersome amounts. About 6.6 million gallons per day was pumped in the county in 1971, 53 percent from the sand-and-gravel aquifer and 41 percent from the sandstone aquifer. About 40 percent of the water pumped was for residential use and 38 percent was for industrial and commercial use. (Woodard-USGS)

INTEGRAL EQUATION FOR THE DESCRIPTION OF STREAM-AQUIFER INTERACTION,
Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
H. J. Morel-Seytoux.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-269 123, Price codes: A02 in paper copy, A01 in microfiche. Report CEP74-75HJM35, Engineering Research Center, Colorado State University Fort Collins, January 1975. 21 p, 24 ref. OWRT B-109-Colorado(1). 14-31-0001-4067.

Descriptors: *Groundwater, *Surface-groundwater relationships, Aquifers, Base flow, *Equations, Flow systems, Pumping, Flooding.
Identifiers: Groundwater models, Flow routing, *Stream-aquifer interactions.

An integral equation is derived which completely characterizes the interaction between a stream and the alluvial aquifer. Expressed in finite difference form the equation is of great practical utility to solve pure flooding problems (negligible effect of pumping on river flows) as it relates river stages to return flows, or pure conjunctive use of surface and groundwater problems (negligible river stage fluctuations) as it relates return flows to pumping rates, or composite problems. The numerical procedures to calculate the response function coefficients in terms of the physical characteristics of the system are given in detail.

STRENGTH OF SOIL AGGREGATES: INFLUENCE OF SIZE, DENSITY AND CLAY AND ORGANIC MATTER CONTENT,
Agricultural Research Service, University Park, Pa. Northeast Watershed Research Center.
A. S. Rogowski, and D. Kirkham.
In: 3rd International Symposium on Soil Conditioning, Med. Fac. Landbouww. Rijksuniv. Gent 41/1-1976, p 85-100, 1 fig, 5 tab, 39 ref.

Descriptors: *Soil aggregates, *Soil strength, Size, Organic matter, Soil type, Raindrops, Impact(Rainfall), Cracks, Failure, Rill, Erosion, Soil density, Shear stress, *Iowa.
Identifiers: *Dry aggregate strength, Detachment(Soils), Soil conditioners, Wet aggregate strength.

Aggregates from the plowlayer of three Iowa soils were separated into several size-density groups by gravity fractionation. Carbon, clay, water stability and strength analysis were performed on each group. The density groups could best be described by ranges which showed some tendency to overlap. Aggregate strength decreased with size. Between the soils, large increases in clay content were accompanied by large increase in strength. Raindrop impact and associated shear stress is the principal mechanism of detachment. Processes which promote cracking within the soil mass are likely to facilitate detachment. It is hypothesized that rills are likely to develop on soils where low density values are distributed unevenly over an areal, particularly in the zones of streamline convergence. Use and development of soil conditioners to counteract the shear and seepage forces as well as to provide a skeletal structure for low density material is desirable. (ARS).

SOIL-MOISTURE STRESS AS RELATED TO PLANT-MOISTURE STRESS IN BIG SAGEBRUSH,
Geological Survey, Lakewood, Col. Water Resources Div.
F. A. Branson, and L. M. Shown.
Journal of Range Management, Vol 28, No 3, p 212-215, May 1975. 4 fig, 16 ref.

Descriptors: *Sagebrush, *Soil-water-plant relationships, *Moisture stress, *Evapotranspiration, *Plant growth, Seasonal, Fluctuations, Phenology, Watersheds(Basins), *Colorado, River basins.
Identifiers: *Internal-plant stress range, *Soil-moisture stress, Soil salinity, Leaf persistence, *Eagle River basin(Colo).

Seasonal variation in internal-moisture stress in big sagebrush (Artemisia tridentata Nutt.) is significantly related (correlation coefficient +0.68) to the lowest soil-moisture stresses in the soil profile. Seasonal values for internal-plant stresses range from 15.3 to 59.8 bars; for lowest soil stress the range was 0.2 to 36.4 bars. Hour of day, wind, and net radiation are also significantly related to internal-moisture stress in plants. The results presented support the hypothesis that inexpensive internal-plant stress measurements may be used to estimate soil-moisture stress and soil-moisture storage. (Woodard-USGS)

EFFECTS OF SPATIAL VARIABILITY OF SOIL HYDRAULIC PROPERTIES IN WATER BUDGET MODELING,
Commonwealth Scientific and Industrial Research Organization, Wembley (Australia). Div. of Land Resources Management.
A. J. Peck, R. J. Luxmoore, and J. L. Stolzy.
Water Resources Research, Vol. 13, No. 2, p 348-354, April 1977. 4 fig, 4 tab, 22 ref.

Descriptors: *Soil properties, *Hydraulic properties, *Hydrologic budget, *Model studies, *Tennessee, Soil horizons, Hydraulic conductivity, Precipitation(Atmospheric), Rain-runoff relationships, Soil water, Soil profiles, Darcys law, Retention, Infiltration, Evapotranspiration.
Identifiers: Spatial variability, Scaling factor.

There is appreciable spatial variability of soil properties on the scale of a watershed or a field even in a single soil type. The spatial variation of soil water characteristics in an area was simulated from average properties and the assumption of scale heterogeneity. Simulated soil water characteristics and other data representing forest vegetation were used in a model to simulate water budgets over part of a watershed in eastern Tennessee for average April and July weather. Precipitation was assumed to be uniform over the area, and there was no runoff even from the least permeable soil during the months simulated. The spatial variability of soil water conditions had only a small effect on evapotranspiration. Water storage in the soil profile changed, so that the drainage flux beyond the root zone tended to become uniform throughout the area simulated. The characteristic microscopic length of the soil was assumed to be normally distributed in an area, and equations were developed for calculating average soil water characteristics from the retention curves and hydraulic conductivities of a number of soil samples. Components of the water budgets simulated with average soil water characteristics were in excellent agreement with the simulated behavior of the spatially variable soil unit as a whole. The result does not imply similar agreement for other distribution functions and soil-plant-weather combinatons, but the methodology developed may be applied to investigate similar problems. FLOW CHARACTERISTICS DURING INFILTRATION INTO A HORIZONTAL SAND COLUMN,
Agricultural Research Council, Cambridge (England). Unit of Soil Physics.
A. Poulovassilis.
Water Resources Research, Vol. 13, No. 2, p 369-374, April 1977. 9 fig, 13 ref.

Descriptors: *Infiltration, *Diffusivity, *Soil water movement, Soil water, Flow, Laboratory tests, Darcys law, Hydraulic conductivity, Permeability, Groundwater, Groundwater movement, Hysteresis, Soil moisture, Reynolds number, Tensiometers, Porous media, Soils.

Experimental water content profiles established during infiltration into a horizontal sand column were compared with theoretical profiles calculated from the soilwater diffusivity, which was determined independently of the infiltration process. Discrepancies between the theoretical and experimental profiles were found. In particular, the experimental profiles for small times showed a retardation of the penetration which became more pronounced as the water content increased, and no unique relationship between the water content and the variable lambda= x/sq root of t (x being the distance and t the time) was found. Thus, the experimental profiles gave incorrect and varying soilwater diffusivities. The comparison of the actual flow rate q with the rate q' given by the product of the hydraulic conductivity and the observed potential gradient showed that q= alpha q', where alpha is between 0 and 1, alpha varying with the water content and the potential gradient. The effect of the 'less than proportional' flow on the profile development was discussed. It was argued that the infiltration process at relatively late times was conditioned by the profile development during the very early stages. Previous experimental infiltration work was discussed, and it was argued that two mechanisms able to produce non-Darcian behavior may be responsible for the various reported infiltration patterns. Finally, the results of the present work were discussed in terms of a critical Reynolds number where the flow becomes non-Darcian. (Sims-ISWS)

RETENTION AND FLOW CHARACTERISTICS OF POLYMER SOLUTIONS IN POROUS MEDIA,
Kansas Univ., Lawrence.
J. G. Dominguez, and G. P. Willhite.
Society of Petroleum Engineers Journal, Vol 17, No 2, p 111-121, April 1977. 11 fig, 6 tab, 23 ref.

Descriptors: *Retention, *Flow, *Polymers, *Porous media, *Aqueous solutions, Porosity, Cores, Permeability, Laboratory tests, Dispersion, Laboratory equipment, Analytical techniques, Wettability, Velocity, Interstices.
Identifiers: *Linear displacement, *Teflon, Resistance factor, Mechanical entrapment.

Retention and flow characteristics of a solution containing Pusher 700, a high-molecular-weight, partially hydrolyzed polyacrylamide, were studied in an 86-md core made by compacting Teflon powder. The quantity of polymer retained during linear displacement experiments ranged from 10 to 21 microgram/gm for polymer concentrations of 100 to 500 ppm in 2% NaCl solutions. Nearly all retention was attributed to mechanical entrapment because of low polymer adsorption on the Teflon surface. Flow rate affected polymer retention. An increase in velocity was accompanied by polymer retention. Polymer was expelled when the flow

rate was reduced. Inaccessible pore volume was about 19% of the total pore volume. Resistance factors in different sections of the core ranged from 2 to 10 for solutions of 100 to 500 ppm polymer concentration in 2% NaCl. Permeability reduction resulting from polymer retention produces the resistance factor in most of the core at a velocity of 3.2 ft/D. Resistance factors in the Teflon cores were 2 to 3 times lower than those reported for natural porous media where polymer is also retained by adsorption. (Visocky-ISWS)

FINITE ELEMENT SOLUTION OF THE TWO-DIMENSIONAL UNSATURATED FLOW EQUATION,
California Univ., Santa Barbara. Dept. of Mechanical and Environmental Engineering.
J. C. Bruch, Jr., G. Zyvoloski, and J. M. Sloss.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-268 999, Price codes: A06 in paper copy, A01 in microfiche. College of Engineering, (UCSB-ME-75-2), August, 1975. 100 p, 8 fig, 1 tab, 17 ref, append. (California Water Resources Center Project UCAL-WRC-W-336). OWRT A-039-CAL(12).

Descriptors: *Finite element analysis, *Mathematical studies, *Analytical techniques, *Unsaturated flow, *Groundwater movement, Computer programs, Equations, Methodology, Moisture content, Loam, Sands, Clays, Soils.

The two-dimensional partial differential equation describing the movement of groundwater is investigated using the finite element method. The relevant finite element theory is introduced using the two-dimensional linear diffusion equation and then applied to the unsaturated flow equation. The technique employed to solve the equation utilized isoparametric finite elements of the linear or quadratic type. The approach consists of expanding the nonlinear terms in shape functions and employing successive substitution until a fixed error criterion was satisfied. Convergence is usually very fast. Several examples are given comparing the results obtained to similar studies using finite difference techniques. A sample computer program is also provided. The theoretical questions of uniqueness and convergence are considered in detail and a rigorous derivation of error estimates is presented. (Snyder-California, Davis)

PROBLEMS OF OPTIMUM SOIL MOISTURE LEVEL: DETERMINATION AND CONTROL, (IN RUSSIAN),
Moscow State Univ. (USSR).
I. I. Sudnitsin, N. A. Muromtsev, and M. E. Ginzburg.
Vestn Mosk Univ Ser 6 Biol Pochvoved. 29(3), p 32-42, 1974.

Descriptors: *Soil moisture, Transpiration, Soil moisture meters, Loam, Sands, Soil types, Plant physiology.
Identifiers: *Optimum soil moisture.

To find the optimum range of soil moisture for plants, the relationships between soil moisture availability for plants (relative transpiration) and soil moisture potential must be determined. These relationships are not the same for various plants and environments. Soil moisture availability at the same potential is higher for xerophytic than mesophytic and hydrophytic plants; for plants grown on loamy than on sandy soils; for plants with dense roots; for plants during middle stages of their growth; for plants which had survived previous droughts.--Copyright 1975, Biological Abstracts, Inc.

INFILTRATION EQUATIONS FOR SIMPLE SOIL SYSTEMS,
Sydney Univ. (Australia). Dept. of Soil Science.
N. Collis-George.
Water Resources Research, Vol 13, No 2, p 395-403, April 1977. 3 fig, 1 tab, 24 ref.

Descriptors: *Infiltration, *Soil properties, *Model studies, Mathematical models, Equations, Soils, SOil water, *Soil water movement, Hortons law, *Infiltration rates, Dispersion.
Identifiers: Green-Ampt equation, Fokker-Planck equation, van der Want equation.

Empirical equations and physically based equations used to describe vertical infiltration into simple soil systems were compared with experimental data. An empirical equation was proposed which satisfies the conditions that cumulative infiltration is proportional to the sq root of time at short times and reaches a steady-state infiltration rate at long times. The equation, i = i sub o (sq root of tanh T) + Kt, describes the observed behavior of simple soil systems at all times; where i is the cumulative infiltration at time t, K is the infiltration rate at steady-state, i sub o = S(sq root of t sub c), and T = t/t sub c. The sorptivity, S, and a time parameter, t sub c, are soil properties determinable experimentally. The Green and Ampt equation and the Horton equation do not satisfy observed behavior at all times, the former failing at long times and the latter at short times. The equation of van der Want, the linearized Fokker-Planck equation of Philip, and the nonlinearized Fokker-Planck equation of Knight and Philip do not describe the observed behavior of simple soil systems over the whole time range as precisely as the proposed empirical equation. Since i sub o is not an independent part of the equations, its numerical value is defined by the independent parameters S and K; and for the materials examined, the numerical value is generally not the same as the experimental value. Procedures were outlined for treating experimental data, not necessarily complete for all times, to produce the three parameters, K,S, and t sub c for simple systems, and for description infiltration into cracking clays or in cases where ultrashort time effects occur. Identifiers: *Caspian Sea, *Volga River, *USSR, Salinity distribution, Salinity variations.

Despite the relatively large number of papers devoted to the salt regime of the northern Caspian Sea, the origin of salinity requires further study because of the complexity of the phenomenon. The roles of river runoff, wind, and salt exchange with the central Caspian Sea in the origin of the salinity field of the northern Caspian Sea were identified on the basis of a study of the space-time variations of salinity from observational data for 1940-1971. The possible future salinity distribution after a reduction in river runoff volume was determined. (Sims-ISWS)

THE USE AND MISUSE OF PURE WATER PVT PROPERTIES FOR LAKE WATERS,
Rosenstiel School of Marine and Atmospheric Science, Miami, Fla.
C-T. Chen, and F. J. Millero.
Nature, Vol. 266, No. 5604, p 707-708, April 21, 1977. 1 fig, 17 ref.

Descriptors: *Lakes, *Water properties, *Salts, Temperature, Water temperature, Pressure, Volume, Density, Salinity, Water quality, Limnology.

Although dissolved substances affect the thermodynamic properties of lake waters, many limnologists still consider lake water as pure water. This can be a good assumption if used with caution: lake water is by no means pure water, especially when the precise pressure, volume, temperture (PVT) properties are considered. PVT properties of lake water can be determined from an equation of state for seawater, provided that the total mass fraction of dissolved salts in seawater and lake water are equated. In addition, the total mass fraction of dissolved salts affects calculations concerning the temperature of maximum density and thus stability. Therefore, in the absence of direct PVT measurements on a particular lake, it is at present most appropriate to use an equation of state for seawater when examining effects of PVT properties in lakes. Presented here was a short equation of state determined with a precision of 0.000002 g/cu cm in density over the appropriate range for most freshwater lakes, 0-0.6 parts per thousand salinity, 0-30 C, and 0-180 bar. (Sims-ISWS).

ESTIMATION OF WINDS OVER THE GREAT LAKES,
Army Engineer Waterways Experiment Station, Vicksburg, Miss. Hydraulics Lab.
D. T. Resio, and C. L. Vincent.
Journal of the Waterway, Port, Coastal and Ocean Division, American Society of Civil Engineers, Vol 103, No WW2, Proceedings Paper 12951, p 265-283, May 1977. 13 fig, 30 ref, 1 append.

Descriptors: *Winds, *Great Lakes, *Coastal engineering, Numerical analysis, Model studies, Equations, Surges, Estimating equations, Winds, Velocity, Lakes, Mathematical models, Wind pressure, Wind velocity, Theoretical analysis.
Identifiers: Geostrophic wind, Wind estimates.

Past efforts to estimate wind speeds over a large lake have met with very limited success. The purpose of this study was to demonstrate that, with a combined theoretical-empirical approach, winds over a lake can be obtained from transformed wind speeds at nearby land stations. The theoretical results provided a basis for comparison of many empirical data sets and established a rational means of analyzing the expected differences between winds over land and winds over a marine surface, which, in turn, afforded a means of examining systematic variations in the ratio of wind speeds over a lake to wind speeds over land. The good agreement between theory and observation indicated that wind estimates over the lake could be made for a wide range of synoptic conditions with an rms error of 5 knots. The theoretical curve

for the lake wind/land wind ratio provided an estimate of lake winds well beyond wind speeds for which there were good empirical data. (Roberts-ISWS)

Identifiers: *Transjoen Lake(Norway), *Norway.

Transjoen, a lake in S. E. Norway investigated hydrographically from October 1969 to October 1971, consists of two basins, both of which are meromictic (lake with lower layer which does not participate in the periodic circulations). The lake has a large influx of groundwater of varying chemical composition. The calcium content is high, and precipitated calcium carbonate and electrolyte rich groundwater is assumed to be the main reason for the meromictic stability. The redox potentials of monimolimnion (the lower layer which does not participate in the periodic circulation) are extremely low, but in spite of this fact, the content of sulphate is high. 2I. Water In Plants

DISTRIBUTION OF CORN ROOTS IN SANDY SOIL WITH A DECLINING WATER TABLE,
Agricultural Research Service, Mandan, N.D. Northern Great Plains Research Center.
R. F. Follett, R. R. Allmaras, and G. A. Reichman.
Agron J. 66(2), p 288-292, 1974.

Descriptors: *Water table, *Root distribution, *Crop response, *Soil moisture, *Root development, *Water levels, Evapotranspiration, Crop production, Plant growth, Regression analysis, Water requirements, Oxygen, Sands, Depth, Root zone.
Identifiers: Corn, Corn roots, Sandy soil, Zea mays.

Knowledge of root response to declining water tables is important for proper crop production management. Roots from 10 monoliths (91 cm deep), centered over and perpendicular to the corn (Zea mays L.) row, were obtained at about full silk (Aug. 26) from corn growing in 91-cm rows. Water table depths ranged 1.33-2.64 m at silking after declining at the rate of about 1.3 cm/day since July 1. About 20% of the evapotranspiration was supplied by natural precipitation with the remaining 80% from soil water depletion and the water table for the period July 1-Sept. 16 (final harvest). Shoot growth was maximum at intermediate water table depths. An equation describing root distribution was obtained from a regression fit of root depth (Y) as a function of water table depth (X1) and cumulative root weight (X2). A similar fit was made using root length as X2. In no case was more than 10% of the total measured root weight or more than 20% of the total measured root length below 75 cm. The distribution of roots with depth indicates water requirements for corn in these sandy soils must be supplied to a root zone with maximum depth of about 100 cm. Retarded root growth was observed where soil O2 diffusion rate (ODR) was less than 26 g/cm2/108 min. Such ODR values were obtained at depths greater than 30 cm at the shallow water table site. Apparent normal root development occurred when ODR values were greater than 30 g/cm2/108 min and matric suctions were about 100 mbar.

ZOOPLANKTON DEVELOPMENT IN INTENSIVELY EXPLOITED FISHERY PONDS, (IN RUSSIAN),
Moscow State Univ. (USSR).
T. S. Mal'Tsman.
Gidrobiol Zh. 10(2), p 36-41, 1974.

Descriptors: *Zooplankton, Fisheries, Ponds, *Biomass, Carp, Fry, Plankton.
Identifiers: Aristichthys-nobilis.

Zooplankton development in intensively exploited fishery ponds is distinctly dependent on its rate of consumption by fish. Consumption of 200 kg/ha (density of carp fry, 80,000 individuals/ha) has no negative effect on zooplankton development. The zooplankton biomass decreases only with joint rearing of Cyprinus carpio and Aristichthys nobilis (at more than 1000 individuals/ha) when the consumption rate increases to 300-400 kg/ha/season (10-20% of average daily biomass). In this case, the relationship of total consumption to the average daily biomass is close to the P/B (production/biomass) coefficient of zooplankton.—Copyright 1975, Biological Abstracts, Inc.

Available from the National Technical Information Service, Springfield, VA 22161 as PB-269 104, Price codes: A04 in paper copy, A01 in microfiche. M. S. Thesis, 1975. 66 p, 6 fig, 17 tab, 22 ref, append. OWRT B-049-NC(2), 14-31-0001-3626.

Descriptors: *Surveys, *Swamps, *Fish populations, Freshwater fish, Warm-water fish, Trapping, *Fish types, Pounds fish per acre, Number fish per acre, *North Carolina, Streams.
Identifiers: *Duke Swamp(NC), *Hoggard Mill Creek(NC), Unchannelized wetlands, Fish species.

Fish populations were examined in two northeastern North Carolina swamp stream ecosystems from March through August 1972. The abundance of fishes susceptible to wire trapping was estimated during March and April by the Schnabel method. During low water conditions in June, July, and August abundance was estimated by the Petersen technique based on fishes collected with wire traps, gill nets, seines, and an electrofishing unit. Relative abundance of the various species captured during March and April was determined, and a rotenone sample was collected during August. Comparisons were made of fish species and numerical abundance of fishes between Hoggard Mill Creek and Duke Swamp, two unchannelized wetland areas. The study was one part of a prechannelization analysis to assess the effects of stream channelization and wetland drainage on fish and wildlife. (Stewart-NC State)

EOS, Vol 58, No 3, March 1977. American Geophysical Union, p 188-196, 1977. 6 fig, 27 ref.

Descriptors: *Paleohydrology, *Paleolimnology, *Lake sediments, *Sedimentology, Watershed management, Planning, Hydrology, History, Sedimentation rates, Palynology, Dating, Trophic level, Microbiology, *Minnesota, Lakes, Marshes.
Identifiers: *Lake Carlson(Minn), *Kirchner Marsh(Minn).

To understand and predict the magnitude and recurrence of dynamic hydrologic phenomena, especially for events that have a recurrence interval of one hundred years or more, indirect methods of determining hydrologic fluctuations must be used. Lake sediments contain a hydrologic record extending thousands of years into the past. Pollen and seed remains in the sediment of Lake Carlson and Kirchner Marsh, Minnesota, suggest that four droughts with a recurrence interval of 300 to 1,000 years occurred in that vicinity between 5,000 and 7,000 years ago. Pollen, seeds, leaves, diatoms, and other plant, animal, and chemical remains can be used to determine past lake levels, trophic conditions, and changes in sedimentation rates. The effects of land disturbances on lakes and their drainage basins can be assessed. In many cases, abrupt changes in types or abundance of fossils clearly mark the onset of land disturbances, and sedimentation rates usually increase significantly. Through sediment studies, it is possible to determine patterns of predisturbance water-level fluctuation and trophic conditions. This information, which is usually not available from written records, can be used to assess the magnitude of the disturbance, and it provides goals for lake management. (Woodard-USGS)

FLOW REGIMES IN DEBRIS FLOW,
State Univ. of New York at Binghamton.
P. Enos.
Sedimentology, Vol 24, No 1, p 133-142, February 1977. 4 fig, 27 ref. NSF GA-28 621.

Descriptors: *Flow characteristics, *Laminar flow, *Sediments, *Reynolds number, *Boundary layers, Slurries, Turbulent flow, Sewage sludge, Velocity, Froude number.
Identifiers: *Debris flow, *Bingham number, Plastic flow, Clasts.

The Bingham model was suggested for the rheological behavior of debris flow. Velocity plotted against yield strength uniquely defines turbulent and laminar flow in published experimental data on flow of Bingham materials. The regimes are not defined by a unique value of the Bingham number even though it includes both of the critical parameters, yield strength and velocity. Laminar flow in at least the final stages natural debris flows is suggested by sediments with parallel-to-flow or inclined clast fabris, preservation of delicate clasts, blocks projecting from the top of the deposit and an absence of flutes. HYDROTHERMAL PROCESSES IN THE ATLANTIC OCEAN CRUST, 26 DEGREES N,
Texas A and M Univ., College Station. Dept. of Geology.
R. B. Scott, and A. Hajash, Jr.
In: Thermal and Chemical Problems of Thermal Waters, Proceedings of the Grenoble Symposium, August/September, 1975. p 35-46, 4 fig, 1 tab, 51 ref. NSF GA 3545 & DES 74-18567.

Descriptors: *Geochemistry, Hydrology, *Heated water, Chemistry, Hydrothermal studies, Flow, Geology, *Atlantic Ocean, *Thermal water.

Evidence is presented which indicates extensive hydrothermal activity at oceanic spreading centers. Manganese oxides at the study site were found to have chemistries similar to hydrothermal manganese and growth rates two orders of magnitude faster than hydrogenous ferromanganese. Thermal activity which has continued at least sporadically for 100,000 years is indicated by the occurence of hydrothermal crusts coated with hydrogenous crusts. Experimental reactions between seawater and basalt also confirm hydrothermal activity. It was concluded that hydrothermal fluids rise through temperature, pressure, oxygen fugacity and sulfur fugacity gradients with fault zones in the rift valley wall acting as migration paths for the fluids. STUDIES BY THE DYNAMIC METHOD ON THE REACTION OF ROCK WITH HOT SPRING WATER OF THE TAMAGAWA HOT SPRINGS IN JAPAN,
Toho Univ., Tokyo (Japan). Dept. of Chemistry.
I. Iwaji, Y. Yuzo, Y. Seiko, and O. Teiko.
In: Thermal and Chemical Problems of Thermal Waters, Proceedings of the Grenoble Symposium, August/September, 1975. p 119-127, 4 fig, 4 tab, 22 ref.

Descriptors: *Geothermal studies, *Geochemistry, *Hot springs, *Rocks, Chemistry, Water chemistry, *Heated water, Thermal water.
Identifiers: *Japan.

Variations in concentrations of rock components in hot spring water after reaction with water and rock were determined. Generally, concentrations of each component of rock in the hot spring water increased with the lapse of reaction time and reached maximum concentrations of up to 650mg/l in less than 20 minutes to several hours. After this the concentrations decreased according to the nature of the components in rock and water. Generally, extraction of components into hot spring water was effective only at the earlier stage of interaction of rock and water. (See also W77-08677) (Chilton-ORNL)

dentifiers: Artificial quartz sandstone.

ntegral diffusion coefficients were measured at 35 C in the interstitial solution of an artificial quartz anstone. The porous medium was chemically nert, had a porosity of 29.3%, an average grain ize of 200 microns and a formation factor of 1.44. The diffusion coefficients range from 0.0000012 sq cm/sec for CaC12 solution to 0.0000022 sq cm/sec for NaC1 solution. The flux was measured per unit area of liquid saturated pore space. A preliminary study of diffusion in an nterstitial solution of artificial sea water indicated hat diffusion processes deprese the ion/C1(-) ratio for Ca(++), Mg(++) and S04(--) and increase the ratio for K(+) and Na(+). The relative rates of dif-fusion in sea water were K(+) Na(+) C1(-) Ca(++) Mg(++) S04(--). Two quantitative evalua-tions were made on the effect of diffusion in the storage of fresh water in salt water aquifers. The first treatment was concerned with diffusion of Na(+) from the confining shales. The second treatment also took into consideration the release of Na(+) from exchange sites within the shales. The second treatment showed an increase of Na(+) concentration within the fresh water of nearly 300% as compared to the concentration given by the first treatment. It was found in the second treatment that in thin aquifers, appreciable quantities of Na(+) could occur in the fresh water in short time periods. In one hypothetical case treated in this study, the concentration of Na(+) in the fresh water reached 600 mg/liter after only 200 days.

ATMOSPHERIC SULFATE ADDITIONS AND CATION LEACHING IN A DOUGLAS FIR ECOSYSTEM,
Washington Univ., Seattle. Coll. of Forest Resources.
D. W. Cole, and D. W. Johnson.
Water Resources Research, Vol. 13, No. 2, p 313-317, April 1977. 5 fig, 2 tab, 16 ref.

Descriptors: *Precipitation(Atmospheric), *Chemistry of precipitation, *Acidic water, *Leaching, Forests, Douglas fir trees, Soils, Soil horizons, Soil water, Cations, Anions, Chemistry, Rainfall, Sulfates, Hydrogen ion concentration, Conductivity, Acids, Ecosystems.

Precipitation sulfuric acid input was small in comparison to sulfate and cation transfers within the ecosystem studies. Most of the annual incoming hydrogen ions were removed in the forest canopy, presumably through an exchange process. Therefore, canopy leaching appears to be most strongly affected by acid rainfall, whereas soil leaching appears to be dominated by mechanisms internal to the ecosystem, such as carbonic acid leaching and sulfur release from decomposing litter. MOLYBDENUM CONTENT IN THE SUBSURFACE WATERS OF THE VINNITSA OBLAST, (IN RUSSIAN),
Vinnitskii Meditsinskii Institut (USSR).
N. K. Val'chuk, and I. N. Chipik.
Gig Sanit. 4, p 97-98, 1974.

Descriptors: *Molybdenum, Subsurface waters, *Artesian wells, Water wells, Water analysis, Water chemistry.
Identifiers: Artesoam, *USSR(Vinnitsa Oblast).

Artesian wells (343) in the Vinnitsa district (Ukrainian SSR, USSR) were analyzed with respect to the Mo content in subsurface waters. The Mo content in the well water varied considerably both within each region and in the district as a whole. An analysis of the Mo content in crops as a function of the soil-climatic zones established that the maximum content is found in products from regions of the southern forest-steppe soil-climatic zone, where the maximum content was also found in the water. No correlation was found between the Mo level in the environment and the incidence of goiter among the population.--Copyright 1975, Biological Abstracts, Inc.

CHEMICAL CHARACTER OF HEADWATER STREAMS IN VERMONT AND NEW HAMPSHIRE,
Dartmouth Coll., Hanover, N.H.
A. H. Johnson, and R. C. Reynolds, Jr.
Water Resources Research, Vol 13, No 2, p 469-473, April 1977. 3 fig, 3 tab, 12 ref.

Descriptors: *Streams, *Chemical properties, *Water chemistry, *Water quality, *Vermont, *New Hampshire, Watersheds(Basins), Chemistry, Dissolved solids, Chemical analysis, Chemistry of precipitation, Hydrogen ion concentration, Calcium, Magnesium, Sodium, Potassium, Analytical techniques.
Identifiers: *Headwater streams, *Dissolved constituents, Bedrock types, Green Mountains, White Mountains, Plutonic rocks, Solute content.

Streamwater samples were collected from headwater streams in Vermont and New Hampshire during low-flow periods in the fall. Then the samples were analyzed for principal dissolved constituents. Dissolved solids are qualitatively and quantitatively related to bedrock type. Streams draining watersheds underlain by plutonic bedrock are acid, mixed cation sulfate waters with little buffering capacity and very low solute content (about 16 mg/l). Streams draining metamorphic and sedimentary terrains are characterized by neutral pH, alkaline earth cations, and mixed anions or bicarbonate. Concentrations of Ca + Mg + Na + K and pH of streams draining granitic bedrock are lower than those of streams draining similar rock types in small watersheds in the Sierra Nevada and Sangre de Cristo mountains. CHEMICAL AND ISOTOPIC INVESTIGATIONS OF GROUNDWATER IN POTENTIAL GEOTHERMAL AREAS IN HAWAII,
Hawaii Inst. of Geophysics, Honolulu; and Geological Survey, Reston, Va. Water Resources Div.
G. M. McMurtry, P. F. Fan, and T. B. Coplen.
American Journal of Science, Vol 277, No 4, p 438-458, April 1977. 7 fig, 3 tab, 41 ref.

Descriptors: *Geothermal studies, *Hawaii, *Chemical analysis, *Temperature, *Groundwater, Wells, Springs, Precipitation(Atmospheric), Steam, Geophysics, Volcanoes, Evaluation, Isotope studies, Stable isotopes.

The chemical and isotopic compositions of Hawaiian groundwater were studied to locate and evaluate potential geothermal areas. Analyses were made of forty-three samples from twenty-seven wells, two coastal springs, local precipitation, and stream. Three methods of chemical geothermometry were applied: (1) silica, (2) Na-K-Ca, and (3) stable isotope or deuterium-oxygen-18. Based on the silica and stable isotope methods, the most promising geothermal areas are the summit of Kilauea Volcano and the area near geothermal test hole 3 in the Puna district (east rift zone of Kilauea Volcano). There, temperatures calculated from dissolved silica range from about 160 degrees to 275 degrees C. Mixing with cooler groundwaters appears to be a significant feature of these geothermal reservoirs. Seawater intrusion, possibly due to thermal disruption of the equilibrium of the Ghyben-Herzberg lens in geothermal areas, tends to interfere with the geothermometry of the Na-K-Ca and stable isotope methods. MINERAL DISTRIBUTION WITHIN THE SEDIMENTS OF PEARL HARBOR,
Hawaii Univ., Honolulu. Dept. of Geology and Geophysics.
B. W. Turner.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-268 896. Price codes: A06 in paper copy, A01 in microfiche. M.S. Thesis, August 1975. 93 p, 15 fig, 9 tab, 4 ref. OWRT A-043-HI(1). 14-31-0001-4011, 14-31-0001-5011 (Part.).

Descriptors: *Sediment deposits, *Anaerobic conditions, *Montmorillonite, *Metals, *Hawaii, Harbors, Distribution, Mineralogy, Chromium, Nickel, Iron, Lead, Zinc, Copper, Water pollution sources.
Identifiers: Estuarine stratification, *Stratified water column, Forminifera, Pearl Harbor(Hawaii), *Mineral distribution.

Some of the metal concentrations reported for areas in Pearl Harbor, Hawaii may be the result of natural processes, i.e., chromium and nickel in relation to the basaltic mineral suite, and iron, zinc, lead, and copper to the distribution of anaerobic bottom conditions. Such conditions would probably occur in the Harbor in its natural state, although they are greatly enhanced by man's activity and large contribution of organic detritus. Montmorillonite is found in greatest abundance in the southeast Loch area near the bentonitic Salt Lake tuff; its general distribution throughout the Harbor is governed by proximity to highly montmorillonitic soils and tuffs and the degree of vertical mixing within the stratified water column. The distribution of authigenic pyrite in the Harbor is related to the depth to the anaerobic layer and to the distribution of organic matter. Estuarine stratification is pronounced in West and Middle Lochs, and the stability of the water column combined with the high influx of organic matter renders the bottom layer anoxic. In West Loch the production of H2S in the sediments may restrict the habitat of foraminifera to the shallow (probably the upper 5 m) periphery of the Loch; the character of the foraminiferal population fluctuates greatly with the volume of fresh water influx and the effects of prevailing winds on the brackish layer. Coral fragments and clayey carbonaceous sediments indicate dredge spoils.

CURRENT-METER RECORDINGS OF LOW-SPEED TURBIDITY CURRENTS,
Scripps Institution of Oceanography, La Jolla, Calif. Geological Research Div.
F. P. Shepard, P. A. McLoughlin, N. F. Marshall, and G. G. Sullivan.
Geology, Vol 5, No 5, p 297-301, May 1977. 6 fig, 9 ref. NSF DES74-22089, ONR N00014-69-A-0200-6049.

Descriptors: *Currents(Water), *Ocean currents, *Turbidity currents, *Submarine Canyons, Coasts, *Current meters, Tides, Canyons, Sediment transport, Flow, Turbidity, Oceanography, Sediments.

Turbidity currents of high velocity may occur during catastrophic conditions, but records suggest that currents of little more than 1 knot (= 0.5 m/s) may be quite common in submarine canyons. Three current-meter records of such currents were obtained (1) during an onshore storm at La Jolla, California, (2) during relatively high swells off the Rio Balsas Delta in western Mexico, and (3) in Abra Canyon off the Abra Delta in northwest Luzon during flood conditions. A pattern observed in all these occurrences included a preceding, relatively large, upcanyon flow, a rapid buildup of the downcanyon turbidity current, a slow decay, and a following interval of no current. The currents may be particularly common where deltas have built across the continental shelf and where large masses of sediment are being introduced into canyon heads. The relatively weak currents may transport large quantities of sediment down the canyon. (Sims-ISWS)

GRAIN-SIZE PARAMETERS OF INSOLUBLE RESIDUES IN MIXXED TERRIGENOUS-SKELETAL CARBONATE SEDIMENTS AND SEDIMENTARY ROCKS: SOME NEW ZEALAND EXAMPLES,
Waikato Univ., Hamilton (New Zealand). Dept. of Earth Sciences.
C. S. Nelson.
Sedimentology, Vol 24, No 1, p 31-52, February 1977. 14 fig, 1 tab, 27 ref.

Descriptors: *Particle size, *Beaches, *Deposition(Sediments), Environment, Sieve analysis, Sediment distribution, Geologic investigations, Carbonates, Sediment transport, Sediment sorting, Histograms, On-site investigations, Foreign countries, Foreign research.
Identifiers: *Terrigenous-skeletal sediments, *New Zealand, Depositional processes.

Grain-size parameters derived from the mechanical analysis of acid-insoluble residues from mixed terrigenous-shell beach sediments from Auckland, New Zealand, are more effective for interpreting the depositional processes and for characterizing the beach environment on textural scatter plots than are parameters based on the analysis of the total beach samples. This results mainly from the wide variations in size of hydraulically equivalent skeletal carbonate grains in the sediment, especially in the coarser size grades, but may also be accentuated by the local origin and by susceptibility to alteration of the shell material. Compared with the total sediment grain-size distribution, the insoluble residues from the beach deposits are characteristically finer-grained, better sorted, and more consistently coarse-skewed and leptokurtic. The grain-size distribution characteristics of insoluble residues from several stratigraphic units in a sequence of Oligocene mixed terrigenous-skeletal shelf sediments in the South Auckland region distinguish depositional mechanisms and environmental energy levels for each unit that are consistent with interpretations made on the basis of carbonate petrography and palaeontology. With regard to the bulk content of terrigenous mud in the insoluble residues, the grain-size distribution of the fraction coarser than 4 phi is alone diagnostic of the energy-time trends in these sediments. (Visocky-ISWS)
W77-08848

OCEANOGRAPHIC FEATURES, CURRENTS, AND TRANSPORT IN CABOT STRAIT,
Quebec Univ., Rimouski. Dept. of Oceanography.
M. I. El-Sabh.
Journal of the Fisheries Research Board of Canada, Vol 34, No 4, p 516-528, April 1977. 13 fig, 3 tab, 38 ref.

Descriptors: *Straits, *Estuaries, *Currents(Water), *Canada, *St Lawrence River, Flow, Water temperature, Salinity, Variability, Runoff, Surface runoff, Rivers, On-site investigations, Model studies, Mathematical models, Oceanography.
Identifiers: *Cabot Strait(Canada).

Seventy oceanographic sections across Cabot Strait, taken at various times of the year between 1950 and 1974, were utilized to describe the average oceanographic features, currents, and volume transport patterns as well as their variations with depth and time. The water mass structure in Cabot Strait is a two-layered structure; the water in the upper 50-100 m typically is moving seaward, while below that depth it is commonly found to be moving into the Gulf. The character of the upper layer which is normally not of uniform thickness across the Strait, but is distinctly wedge-shaped, is subject to considerable seasonal variation, whereas that of the lower is quite uniform the year round. Seasonal and long-term variations of the physical properties in Cabot Strait were described. Outflow through Cabot Strait was shown to be concentrated in the upper layer off Cape Breton and is balanced by inflow at intermediate depths on the Newfoundland side and in the deep portions of the section. The maximum and minimum transports, both inflow and outflow, occur in August and June, respectively. The net outward volume transport through the Strait increases from 9000 cu m/s in April to 2500 cu m/s in August and decreases to about 100 cu m/s in February. The weighted mean value, 13000 cu m/s agrees well with the value obtained from an estimate of net freshwater input rate (run-off plus precipitation minus evaporation) above the section. The maximum transport occurs at times of surface minimum salinity. Horizontal advective transport of salt was found to be more important than horizontal diffusive transport. Recommendations for future transport studies in Cabot Strait were presented. (Sims-ISWS)

HYDROTHERMAL FLUIDS OF SEAWATER SALINITY IN OPHIOLITIC SULPHIDE ORE DEPOSITS IN CYPRUS,
Oxford Univ. (England). Dept. of Geology and Mineralogy.
E. T. C. Spooner, and C. J. Bray.
Nature, Vol 266, No 5605, p 808-812, April 28, 1977. 4 fig, 1 tab, 41 ref.

Descriptors: *Hydrothermal studies, *Mineralogy, *Sulfides, *Sea water, Pyrite, Freezing, Salinity, Copper, Convection, Metamorphic rocks, Microscopy, Economic impact.
Identifiers: *Ore deposits, *Cyprus, *Metal transport, Freezing points, Oceanic crust layer 2, Fluid inclusions, Thin sections.

Freezing points of fluid inclusions in vein quartz intergrown with sulphides from ophiolitic cupriferous pyrite ore deposits in Cyprus indicate a hydrothermal fluid of seawater salinity and confirm the hypothesis of metal transport in hot seawater. Therefore, it was suggested that the economic potential of oceanic crust layer 2 is probably neligible. (Visocky-ISWS)

TESTING OF A TECHNIQUE FOR REMOTELY MEASURING WATER SALINITY IN AN ESTUARINE ENVIRONMENT,
National Aeronautics and Space Administration, Bay Saint Louis, Mo. Earth Resources Lab.
G. C. Thomann.
Available from the National Technical Information Service, Springfield, VA 22161 as N76-22634, Price codes: A03 in paper copy, A01 in microfiche. Report No. 118, January 1975. 37 p, 11 fig, 8 tab, 4 ref.

Descriptors: *Salinity, *Remote sensing, *Estuarine environment, *Resources development, Baseline studies, Environmental effects, Estuaries, Mississippi.
Identifiers: *Outer Continental Shelf, *Mississippi Coast.

An aircraft experiment was flown on November 7, 1973 to test a technique (Thomann, 1973) for remote water salinity measurement. Apparent temperatures at 21 cm and 8-14 micro m wave lengths were recorded on eight runs over a line along which the salinity varied from 5 to 30 o/oo. Boat measurements were used for calibration and accuracy calculations. Overall RMS accuracy over the complete range of salinities was 3.6 o/oo. Overall RMS accuracy for salinities greater than o/oo, where the techniques is more sensitive, was 2.6 o/oo. Much of this error is believed to be due to in ability to exactly locate boat and aircraft positions. The standard deviation over the eight runs for salinities approximately 10 o/oo is 1.4 o/oo; this error contains a component due to mislocation of the aircraft also. It is believed that operational use of the technique is possible with accuracies of 1-2 o/oo under conditions specified in the paper. (Sinha-OEIS)

DUNE STABILIZATION WITH PANICUM AMARUM ALONG THE NORTH CAROLINA COAST,
North Carolina State Univ. at Raleigh. Dept. of Botany; and North Carolina State Univ. at Raleigh. Dept. of Soil Science.
E. D. Seneca, W. W. Woodhouse, Jr., and S. W. Broome.
Available from the National Technical Information Service, Springfield, VA 22161 as ADA-023 178, Price codes: A03 in paper copy, A01 in microfiche. U.S. Army Coastal Engineering Research Center Miscellaneous Report NO 76-3, February 1976. 43 p, 16 fig, 13 tab, 8 ref. DACW72-73-C-0025.

Descriptors: *Stabilization, *Dunes, *North Carolina, Coasts.
Identifiers: *Panicum amarum, Bitter panicum, Ammophila breviligulata, American beachgrass, Dune building, Resources management, *Dune stabilization.

Dune stabilizing and dune building potential of Panicum amarum (bitter panicum) along the North Carolina coast was studied. A nursery was established with transplants collected from two coastal locations to provide transplants for field experiments. Techniques for propagation, handling, processing, and planting bitter panicum for use in coastal areas were determined. Experimental plantings with emphasis on bitter panicum together with Ammophila breviligulata (American beachgrass) and Uniola paniculata (sea oats) were made at two coastal locations. On a sandy site about 300 meters inland where there was relatively little sand moving, bitter panicum contributed more of the estimated cover through two growing seasons than either of the other two grasses. Over a 24-month period at a foredune site, bitter panicum accumulated about one-fourth the sand accumulated by either three selections of American beachgrass or mixed species plantings involving all three grasses. Results indicate that the principal values of bitter panicum are in stabilizing sandy coastal areas and in mixed species plantings to build and stabilize coastal foredunes in the southeastern United States. (Sinha-OEIS)

COMPARISON OF REMOTELY SENSED CONTINENTAL-SHELF WAVE SPECTRA WITH SPECTRA COMPUTED BY USING A WAVE REFRACTION COMPUTER MODEL,
National Aeronautics and Space Administration, Langley Station, Va. Langley Research Center.
L. R. Poole.
National Aeronautics and Space Administration, Technical Note NASA TN D-8353, December 1976. 43 p, 10 fig, 12 ref.

Descriptors: *Remote sensing, *Continental shelf, *Computer models, *Refraction(Water waves), Geophysics, Shoals, Energy.
Identifiers: *Wave spectra, Wave refraction, Mid-Atlantic Ocean.

An initial attempt was made to verify the Langley Research Center and Virginia Institute of Marine Science mid-Atlantic continental-shelf wave refraction model. The model was used to simulate refraction occurring during a continental-shelf remote sensing experiment conducted on August 17, 1973. Simulated wave spectra compared favorably, in a qualitative sense, with the experimental spectra. However, it was observed that most of the wave energy resided at frequencies higher than those for which refraction and shoaling effects were predicted. In addition, variations among the experimental spectra were so small that they were not considered statistically significant. In order to verify the refraction model, simulation must be performed in conjunction with a set of significantly varying spectra in which a considerable portion of the total energy resides at frequencies for which refraction and shoaling effects are likely. (Sinha-OEIS)

Descriptors: *Continental Shelf, *Compute models, *Refraction(Water waves), *Submarin canyons.
Identifiers: *Outer Continental Shelf, *Wav refraction, Mid-Atlantic, Oceanographic data *Baltimore Canyon, Bottom topography.

The Langley Research Center and Virginia In stitute of Marine Science wave refraction com puter model was applied to the Baltimore Canyo region of the mid-Atlantic continental shelf. Wav refraction diagrams for a wide range of normall expected wave periods and directions were com puted by using three bottom topography approx mation techniques: quadratic least squares, cubi least squares, and constrained bicubic interpola tion. Mathematical or physical interpretation c certain features appearing in the computed dia grams is discussed. (Sinha-OEIS)

HARBOR AND NEARSHORE CURRENTS OSWEGO HARBOR, NEW YORK,
National Oceanic and Atmospheric Administra tion, Ann Arbor, Mich.
G. S. Miller.
Available from the National Technical Informa tion Service, Springfield, VA 22161 as PB-254 651 Price codes: A03 in paper copy, A01 in microfiche NOAA Technical Report No ERL 360-GLERL 7 January 1976. 32 p, 19 fig, 14 ref. Also as GLERL Contribution No 59.

Descriptors: *New York, *Currents(Wate waves), *Cooling water, Harbors, Lake Ontario Powerplants, Water temperature.
Identifiers: *Nearshore currents, *Seasonal varia tion, *Wind stress, *Oswego Harbor(NY).

The results of a study to determine current pat terns in the harbor and adjacent nearshore are and to relate these patterns to main generatin forces is presented. The results of this report an several other coastal investigations conducted i the Oswego area indicate persistant eastwar flowing baroclinic coastal currents. It has been ob served that wind stress transports warm Lake On tario surface water toward the south shore thereby resulting in strong baroclinic coastal cu rents toward the east. Airborne thermal mappin of the harbor area indicates that the outflow o warm river water and power-plant cooling effluen from the harbor affects the water temperature an nearshore flow patterns out to more than 4 kilome ters in the lake and that the higher temperatur water is evident through all seasons. Dynami height analysis also indicates a northward bulge a Oswego. (Sinha-OEIS)
W77-08913

STORM TIDE FREQUENCY ANALYSIS FO THE COAST OF GEORGIA,
National Weather Service, Silver Spring, Md. Of fice of Hydrology.
F. P. Ho.
Available from the National Technical Informa tion Service, Springfield, VA 22161 as COM 7411746, Price codes: A03 in paper copy, A01 i microfiche. NOAA Technical Memorandum NWS HYDRO-19, September 1974. 31 p, 8 fig, 4 tab, 1 ref.

Descriptors: *Tides, *Georgia, *Floods, *Lan use, Storms, Frequency analysis, Hurricanes Coasts, Insurance, *Flood plain insurance.
Identifiers: *Storm tides.

Storm tide height frequency distributions are developed on the Georgia coast for the National Flood Insurance Program by computing storm tides from a full set of climatologically representative hurricanes, using the National Weather Service hydrodynamic storm surge model. Tide levels are shown in coastal profile between annual frequencies of 0.10 to 0.002. This report is intended for use in estimating actuarial risk to buildings from coastal floods and in land use management. (Sinha-OEIS)

COOPERATIVE GULF OF MEXICO ESTUARINE INVENTORY AND STUDY--TEXAS: AREA DESCRIPTION,
National Marine Fisheries Service, Galveston, Tex. Gulf Coastal Fisheries Center.
R. A. Diener.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-252 511, Price codes: A07 in paper copy, A01 in microfiche. NOAA Technical Report NMFS CIRC-393, September 1975. 136 p, 55 fig, 26 tab, 52 ref.

Descriptors: *Estuaries, *Baseline studies, *Water pollution, *Environmental effects, *Texas, *Gulf of Mexico, Shellfish, Waste disposal.
Identifiers: Outer Continental Shelf, Resource availability, Inventory.

Seven Texas estuarine areas are described in terms of their dimensions; major vegetation types; geology and geological history, drainage basins and stream discharge records; hydrological, biological, and benthic properties; populations and economic development; pollution; and navigation projects. These areas include the Sabine Lake, Galveston Bay, Matagorda Bay-Brazos River Delta, San Antonio Bay, Copano-Aransas Bay, Corpus Christi Bay, and the Laguna Madre. A list of pertinent literature is also presented. The Texas coast is important for its sport and commercial fisheries and for waterfowl hunting. Pollution from domestic and industrial sources has forced the closing of about 325,090 acres of open bay waters to shellfishing and an additional 16,600 acres closed on a conditional basis. Over 1,050 miles of Federal navigation channels are situated on the Texas coast, the most important of which is the Gulf Intracoastal Waterway, which extends from the Sabine River to Brownsville. Large areas of open estuarine waters, especially in the Sabine Lake and Galveston Bay areas, have been displaced by large spoil areas. (Sinha - OEIS)

BEACH SAND TRANSPORT: DISTRIBUTION AND TOTAL DRIFT,
Oregon State Univ., Corvallis. Estuarine and Coastal Research Program.
P. D. Komar.
Journal of the Waterway, Port, Coastal and Ocean Division, American Society of Civil Engineers, Vol. 103, No. WW2, Proceedings Paper 12916, p 225-239, May 1977. 6 fig, 18 ref, 1 append.

Descriptors: *Beaches, *Sands, *Sediment transport, Coastal engineering, Laboratory tests, Littoral drift, Scaling, Surf, Oceans.
Identifiers: Scale effect, Wave energy, Wave tanks, Longshore sand transport.

Considerable data were collected in laboratory wave basins in an attempt to relate the sand transport rate to the wave conditions. The study undertook a review of laboratory data in an attempt to determine if any scaling laws can account for the scatter, laws which might indicate how the transport rate is a function of grain size and density. No such systematic laws were found; the laboratory data did not even demonstrate a relationship between the sand transport rate and the settling velocity of the beach sediment. Solutions were developed for the distribution of longshore sand transport across the beach width. One solution ignores the stress due to the longshore currents, including only the stress of the waves; a more complicated solution includes both stress contributors. In both cases, the distributions were made to yield the correct total and transport rate, according to the field data, when the distributions are integrated across the surf zone width. (Lee-ISWS)

ESTIMATING WAVE GENERATION ON RESTRICTED FETCHES,
California State Dept. of Navigation and Ocean Development, Sacramento; and Scripps Institution of Oceanography, La Jolla, Calif.
R. J. Seymour.
Journal of the Waterway, Port, Coastal and Ocean Division, American Society of Civil Engineers, Vol 103, No WW2, Proceedings Paper 12924, p 251-264, May 1977. 10 fig, 3 tab, 19 ref, 1 append.

Descriptors: *Coastal engineering, *Fetch, *Model studies, Lakes, Waves(Water), Winds, Bays, Water, Equations, Measurement.
Identifiers: *Wave energy, *Wave forecasting, Wave generation, Wave spectrum, Restricted fetches, Measured spectra, Limited fetches.

The applicability of one-dimensional wave generation models to fetches that are restricted in width as well as length was considered. An analytical estimation approach, the spectral contribution method, was developed and compared with measured results from four sites with varying degrees of fetch restriction. For width restricted fetches, the spectral contribution method was a more efficient estimator than the effective fetch method. Two one-dimensional wave generation models and two directional distribution models were investigated. For limited fetches, the JONSWAP spectrum appeared to be slightly superior to the Bretschneider spectrum; and the Pierson, Neumann, and James distribution yielded better estimates than the Longuet-Higgins, Cartwright, and Smith distribution. THE THIRD LONDON AIRPORT STUDY,
Hydraulics Research Station, Wallingford (England).
T. J. Weare.
Journal of Hydraulics Research, Vol. 15, No. 1, p 55-72, 1977. 11 fig, 5 ref.

Descriptors: *Reclamation, *Estuary, *Model studies, *Numerical analysis, *Currents(Water), Hydraulic engineering, Momentum equation, Coriolis force, Turbulence, Sediment transport.
Identifiers: *Thames Estuary.

The proposal to construct an airport and a seaport on the reclaimed land in the Thames Estuary raised questions about the effects of reclamation on the hydraulics of the estuary. A large physical model was built to assess the local effects due to reclamation, to test the various design shapes of the reclamation, and to identify suitable borrow areas for the large quantities of fill material required. In addition to the physical model, a numerical model study was carried out, the principal function of which was to fill a supporting role complementary to that of the physical model. The physical model was found to be critically sensitive to the current generator controls. Some processes such as Coriolis force, sediment transport, surface wind, changing friction due to changing bed forms, and diffusion, which cannot be easily modeled and varied in a physical model, can be included in a numerical model. This is the complementary supporting role for such models. It is reasonable to expect that an increasing proportion of hydraulic investigations will be undertaken by numerical techniques as computing sources continue to develop. (Singh-ISWS)

A RECONNAISSANCE OF THE HYDROLOGY OF THE EDISTO AND ASHEPOO ESTUARIES, SOUTH CAROLINA,
Geological Survey, Columbia, S.C. Water Resources Div.
F. A. Johnson.
South Carolina Water Resources Commission, Columbia, Report No 6, 1976. 53 p, 13 fig, 10 tab, 16 ref.

Descriptors: *Tidal effects, *Estuaries, *South Carolina, *Saline water intrusion, *Saline water-freshwater interfaces, Water quality, Stratification, Mixing, Low flow.
Identifiers: *Edisto estuary(SC), *Ashepoo estuary(SC).

A reconnaissance study has been made to provide background information on some of the physical and chemical characteristics of the Edisto and Ashepoo estuaries in South Carolina. Data were collected from the estuaries on the physical dimensions, tidal stages, saltwater intrusion at high and low tides, and water-quality above the saltwater intrusion. The times of the high and low tides at the upper ends of the estuaries lag those at the lower end by several hours. Tidal range is reduced at the upper ends by about 70 percent. During

average freshwater inflow conditions, the interface between freshwater and saltwater penetrates the Edisto estuary to mile 19.5 and the Ashepoo estuary to mile 24 at high tide. During periods of very low freshwater inflow, such as the 7-day 10-year low flow, the interface at high tide might penetrate to mile 32 (near Jacksonboro) on the Edisto River. During a similar low-flow period, the Ashepoo River would be brackish or salty to about mile 38. Above the saltwater interface, the water of both estuaries is of good quality and suitable for most uses if treated for iron and color. The bed sediments throughout the study area, with the exception of iron, have little or no indications of heavy metals, herbicides or pesticides. (Woodard-USGS)
W77-09076

A RECONNAISSANCE OF THE HYDROLOGY OF THE INTRACOASTAL WATERWAY FROM BUCKSPORT TO LITTLE RIVER INLET, SOUTH CAROLINA,
Geological Survey, Columbia, S.C. Water Resources Div.
F. A. Johnson.
South Carolina Water Resources Commission, Columbia, Report No 7, 1977. 33 p, 7 fig, 7 tab, 8 ref.

Descriptors: *Saline water-freshwater interfaces, *Navigable waters, *Coasts, *South Carolina, Canals, Inflow, Rivers, Tidal effects, Tidal streams, Estuaries, Salinity, Travel time, Tracers, Dye releases, Saline water intrusion, Stratification, Water quality, Evaluation, Water utilization.
Identifiers: *Intracoastal Waterway(SC).

Some of the physical and chemical characteristics of the Intracoastal Waterway (ICWW) between Bucksport and Little River Inlet, South Carolina, have been related to tidal conditions and freshwater inflow; also the suitability of the water for use has been considered. Dye tracing techniques have been used to determine the time-of-travel from mile 375 where the Waccamaw River enters the ICWW to Little River Inlet below mile 342. Fresh surface-water flow is contributed only by one major tributary, the Waccamaw River, which divides at mile 375, with two-thirds flowing southward. The one-third that flows northward takes about 6 days to reach Little River Inlet. The position of the saltwater interface at high tide in the ICWW is largely controlled by the portion of the Waccamaw River flow that goes northward and is itself probably governed by the amount of backwater caused by the Pee Dee River through Bull Creek. The interface at high-slack tide changes position by only a few miles between low and high freshwater inflow, usually remaining within 6 to 10 miles of Little River Inlet. The water above the interface is of good quality and suitable for most uses. (Woodard-USGS)
W77-09077

PRELIMINARY SUMMARY OF THE 1976 ATLANTIC MARGIN CORING PROJECT OF THE U.S. GEOLOGICAL SURVEY,
Geological Survey, Reston, Va. Water Resources Div.; and Geological Survey, Reston, Va. Geologic Div.
J. C. Hathaway, J. S. Schlee, C. W. Poag, P. C. Valentine, and E. G. A. Weed.
Open-file report 76-844, November 1976. 217 p, 4 append.

Descriptors: *Core drilling, *Core logging, *Continental shelf, *Atlantic Ocean, *United States, Coasts, Petrology, Offshore platforms, Sedimentology, Freshwater, Salinity, Aquifers, Stratigraphy, Chemical analysis, Environment.

The U.S. Geological Survey Atlantic Margin Coring Project, 1976, a 60-day expedition to obtain core samples by drilling beneath the floor of the Continental Shelf and Slope of the eastern United States, was carried out in July, August, and September 1976 aboard D/V GLOMAR CONCEPTION. The coring penetrated as much as 310 meters below the sea floor at 19 sites along the continental margin from Georgia to Georges Bank off New England in water depths ranging from 20 to 300 meters; 1,020 meters of material were recovered in 380 cores, ranging in age from Late Cretaceous to Holocene. One of the major findings was the discovery of relatively fresh water (salinities less than 3 parts per thousand) extending beneath the Continental Shelf as much as 60 nautical miles seaward from the New Jersey coast. Water of about 1 part per thousand salinity was found beneath the shelf more than 7 nautical miles off Ocean City, Maryland and Barnegat Inlet, New Jersey. Analyses for light hydrocarbons in the cores show the highest concentrations (as much as 412,000 ppm) at sites in water depth greater than 200 meters (the shelf-slope break), principally in Pleistocene sediments, although methane concentrations greater than 400,000 ppm also were found in Miocene sediments at one site near the shelf edge. DEVELOPMENT OF A LOW COST ASPHALT-RUBBER MEMBRANE FOR WATER HARVESTING CATCHMENTS AND RESERVOIR SEEPAGE CONTROL,
Arizona Water Resources Research Center, Tucson.
R. K. Frobel, C. B. Cluff, and R. A. Jimenez.
Available from the National Technical Information Service Springfield VA as PB-268 779, Price codes: A04 in paper copy, A01 in microfiche. Completion Report, June 1977, 50 p, 17 fig, 8 tab, 13 ref, 2 append. OWRT A-075-ARIZ(2), 14-34-0001-7006.

Descriptors: *Seepage control, Water harvesting, *Asphalt, *Rubber, Water conservation, Testing, Absorption, Viscosity, *Reservoir leakage.
Identifiers: Waterproof membranes, *Asphalt rubber membranes.

This project was concerned with the laboratory and field investigation of asphalt-rubber for use in water seepage control applications. Laboratory testing utilized for physical property determination included viscosity, ductility (ASTM D113-74), flow/slope stability, brittleness/impact resitance (ASTM D994-72), water vapor transmission (ASTM E96-72, Procedue BW), water absorption (ASTM 570-72)I, and permeability. Also, some specialized laboratory equipment was desinged and fabricated for the testing. The results of the testing showed that the asphalt-rubber is relatively impermeable as a membrane, and that the rubber does not effect an otherwide impermeable asphalt film. Physical properties of the base asphalt that are increased with the addition of rubber include water absorption, viscosity, and impact resistance. The tests that exhibited lower physical property values were ductility and slope stability. Investiga
tions of field appliations of asphalt-rubber resulte
in preliminary subgrade preparation specifica
tions. Also, the field installations supported th
hypothesis that the asphalt-rubber can be effec
tively used as a water seepage barrier. Preliminar
specifications for asphalt-rubber mixing and fiel
appliation are also included.

Completion Report, Dec. 1976. 36 p, 22 fig, 1 tab,
ref. OWRT C-6176(No. 5219)(1).

Descriptors: *Aquifers, Aquifer testing, Ari
lands, *Artificial recharge, Artificial use, Ban
storage, Channel beds, Design criteria, *Domesti
water, Freshwater, *Groundwater, Overland flow
Percolation, Pervious soils, Potable water, Rain
fall, Runoff, Sands, Soil moisture, *Soil physics
Terrain, Springs, *Indian reservations, Wate
storage, New Mexico, South Dakota, Wate
supply.

Experimental rock and soil strata for collection
filtration and storage of rainfall and runoff wate
were constructed on three separate Indian Reser
vations: Ramah Navajo, and Santa Clara Pueblo i
New Mexico, and the Pine Ridge (Oglala Sioux) i
South Dakota. The artificial spring strata wer
constructed to determine their potential in th
development and use of Indian and other land
located in the arid and semi-arid sections of th
country where the availability of adequate wate
supplies for domestic use, for watering livestoc
in otherwise suitable grazing areas, and for th
production of food crops is either severely limite
as surface water, or the groundwater is non-ex
istent, excessively saline, or at very great depths
The principle objective was to provide a reliabl
source of potable water at a relatively low cost
The most important factors in the concentration o
experimental strata were site location, technique
of construction of the facility, selection of strat
material and method of placement of impermeabl
layer.

vailable from the National Technical Informa-on Service, Springfield, VA 22161 as PB-268 975, rice codes: A06 in paper copy, A01 in microfiche. laster of Science Thesis, 1974. 109 p, 12 fig, 6 ab, 56 ref, 6 append. OWRT A-045-ARIZ(2). 14-1-0001-5003.

escriptors: Watershed management, *Forest atersheds, Evaluation, *Snowmelt, Runoff, Vater yield, Water supply, Forest management, Arizona, *Water yield improvement, Snowpacks, *Rainfall-runoff relationships, Small atersheds.
lentifiers: New water supply, Forest manage-ent guidelines.

technique was developed for determining daily alues of runoff efficiencies from small atersheds by coupling a computer model that mulated Arizona snowmelt processes with raphical techniques of runoff hydrograph separa-on. The computer program was a USDA Forest ervice model modified to better simulate Arizona onditions. An explanation of modifications and mitations of the model is given, along with equa-ons for estimating some of the model input varia-les. Seven small watersheds with a total of 14 ears of record were used in evaluating changing atterns of runoff efficiencies within a year. Addi-onally, many physical, biological, and climatic ariables were correlated with seasonal runoff ef-iciencies not only among years and among atersheds, but also within a watershed among ears, and among watersheds within a season. Pre-iction equations were also formulated that could e of use in the identification of high water yield-ng watersheds.

Descriptors: *Water conservation, Conservation, Pulp and paper industry, Water utilization, Textiles, *Municipal water, *Industrial wastes, *Water reuse, Water rates, Pricing, Maryland, Pennsylvania, *North Carolina.
Identifiers: Hyattsville(Md), *Residential water, *Water saving devices.

This conference was designed specifically to explore ways of making better use of existing water supplies and reducing the cost of wastewater management through conservation and more efficient practices. Thirteen presentations are included on residential, food processing, pulp and paper, and textile water conservation. Papers also were presented on water saving devices and conservation in suburban Maryland and in Pennsylvania. Innovative approaches to rate-making and rate structures were topics for three presentations.

EFFECT OF WATER DEFICIENCY ON THE GROWTH RATE OF SOME WINTER SOFT WHEAT CULTIVARS, (IN BULGARIAN),
Bulgarian Academy of Sciences, Sadovo. Agricultural Experimental Station.
P. G. Stankova.
Fiziol Rast (Sofia) 2(1), p 13-21, 1976.

Descriptors: *Water requirements, *Wheat, *Growth rates, Plant growth, Root development, Consumptive use, Water loss.
Identifiers: Cell sap, Cultivars, Water stress, Water deficit.

Plants from 3 winter soft wheat cultivars ('Sadovska Ranozreika 3', 'San Pastore' and 'Bezostaya 1') differing considerably in morphological and biological characters were grown in Wagner type pots at soil moisture 65-70 MWC (maximum field water capacity). Water stress was achieved by stopping irrigation at stage IV (the tillering phase) and stage VIII (head formation phase) or organogenesis. The plants were kept at the state of permanent wilting for a period of 4 days. The aim of the study was to observe the changes in cell sap concentration, root system development and growth rate which occur in wheat plants of the 3 cultivars as a result of water stress, to follow up their rate and degree of recovery back to the normal state after water stress discontinued until the end of the vegetation period and to evaluate the reduction in yield inflicted to each cultivar. Water stress during stages IV and VIII of wheat organogenesis resulted in higher leaf cell sap concentration and in considerable reduction of total amount of roots and of growth rate. These deviations were more pronounced in the case of water stress during stage VIII. Recovery to normal condition of the indices was only observed in water stress occurring during stage IV and was best achieved in 'Bezostaya L.' Full compensation was not observed. Following water stress during stage IV of organogenesis 'Bezostaya L' had highest grain number and weight per plant, but following water stress at stage VIII this cultivar preserved only the highest grain weight per plant.--Copyright 1977, Biological Abstracts, Inc.

UNIVERSAL COUPLING FOR MOVABLE IRRIGATION PIPES,
Gifford-Hill and Co., Inc., Dallas, Tex. (Assignee).
J. E. Hansen.
U.S. Patent No. 3,997,192, 9 p, 6 fig, 9 ref; Official Gazette of the United States Patent Office, Vol 953, no 2, p 645, December 14, 1976.

Descriptors: *Patents, *Irrigation, *Irrigation systems, *Irrigation practices, *Irrigation efficiency, Distribution systems, Flow control, Application equipment.
Identifiers: *Universal couplings.

As tower supported irrigation systems move during irrigation of land areas, changes in grade occur due to unevenness of the land surface. It is necessary that the various pipe sections that interfit to transport water from the water supply to the irrigation system be capable of vertical movement to accomodate changes in grade as well as accommodating horizontal angular misalignment responsive to tower movement. Coupled irrigation pipes with a pipe coupling that efficiently allows universal movement of the connected pipe sections so as to prevent the development of any strains that might otherwise cause deterioration of the connections between the pipe sections is provided in this invention. Another feature presents a substantially unobstructed flow passage for the water being supplied, allowing the capability of the water supply pumping system to be minimized for a given volume of water that is supplied. S-Kh Biol. 9(2), p 235-237, 1974.

Descriptors: *Drought resistance, *Wheat, *Crop production, *Heat resistance, *Drought tolerance, Crop response, Moisture stress.

Field evaluation of 78 samples of soft wheat in relation to their productivity and origin was done. A positive correlation between drought- and heat-resistance was found, the level of correlation depending on the origin of the varieties.--Copyright 1975, Biological Abstracts, Inc.

FLOW RESTRICTOR AND TRICKLE EMITTER,
M. Lemelshtrich.
U.S. Patent No 3,998,391, 7 p, 10 fig, 7 ref; Official Gazette of the United States Patent Office, Vol 953, no 3, p 1043, December 21, 1976.

Descriptors: *Patents, *Irrigation, *Irrigation practices, *Irrigation efficiency, Application equipment, Flow, Flow control.
Identifiers: Drip irrigation, *Flow restrictor(Irrigation).

The purpose of a flow restrictor is to retard the flow within a predetermined conduit and to reduce the pressure from the head of the source of irrigation water. As a consequence the flow is emitted in the form of a very slow trickle or dropwise. This results in economy in water expenditure and supplies the water in a steady, slow trickle to the point where it is actually needed by the plants or cultures to be irrigated. The invention is a further development of such a flow restrictor and emitter. It is composed of a hollow plate-like element in the interior of a conduit. The conduit has an inlet adapted to be connected to a feed line of water and at least one outlet leading into the open. This conduit meanders from the inlet of the element to the outlet forcing the flow to perform bows and bends within the conduit. (Sinha-OEIS)
W77-08879

EASILY MOVABLE IRRIGATION SPRINKLER SYSTEM,
J. C. St Clair.
U.S. Patent No 3,998,392, 6 p, 4 fig, 3 ref; Official Gazette of the United States Patent Office, Vol 953, no 3, p 1044, December 21, 1976.

Descriptors: *Patents, *Irrigation, *Irrigation systems, *Sprinkler irrigation, Irrigation practices, Irrigation efficiency, Distribution systems, Application equipment.

A sprinkler system weighing, when automatically drained, under 20 pounds per 1000 foot of tubing plus sprinkler heads and, that can be rapidly rolled up by a tractor carrying a reel, is made of two concentric polyester plastic tubes both 2 inches in diameter with 0.001 inch thick walls. The two concentric tubes are sealed together at the top and 0.04 inch diameter holes are spaced at 6 foot intervals along the top seal so that water flowing through the inner tube can spray out. The outer tube is aluminized to protect the polyester against the sun and a black stripe is painted along the top of the outer tube so that photoelectric cells can make the spray holes along the black line be unrolled on top when the irrigation tubing is put in place. When it is desired to move the irrigation tubing, the water is shut off and air is forced between the inner and outer tubes. This forces the water out of the inner tube making an extremely light load to roll up and carry. (Sinha-OEIS)
W77-08880

IRRIGATION SPRINKLING APPARATUS WITH ADJUSTABLE GROUND CONTACTING ELEMENTS,
Gifford-Hill and Co., Inc., Spokane, Wash. (Assignee).
H. E. Lindner, and J. E. Mertaugh.
U.S. Patent No. 3,999,569, 10 p, 6 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 953, no 4, p 1449, December 28, 1976.

Descriptors: *Patents, *Irrigation, *Distribution systems, *Sprinkler irrigation, *Irrigation practices, *Irrigation efficiency, Application equipment, Water conveyance.

The invention describes irrigation apparatus adapted for rotation about a fixed point for irrigation of large generally circular land areas. It is directed to means for establishing positioning between the ground contacting elements of the irrigation apparatus and the respective mobile bases of the apparatus so as to allow the ground contacting elements to be positioned either in an operative position during irrigation operations or in a linear movement position, allowing the apparatus to be moved linearly to other locations in erected condition. It provides precise adjustment between the ground contacting elements of the irrigation apparatus and the respective mobile bases in order to allow wheels, for example, to precisely track an arc about the pivot point during irrigation operations. (Sinha-OEIS)
W77-08886

IRRIGATION DRAIN VALVE,
Ireco Industries, Inc., Eugene, Oreg. (Assignee).
L. W. Clements.
U.S. Patent No. 3,999,570, 3 p, 2 fig, 7 ref; Official Gazette of the United States Patent Office, Vol 953, no 4, p 1449-1450, December 28, 1976.

Descriptors: *Patents, *Irrigation, *Irrigation practices, *Irrigation efficiency, Application equipment, Flow control, Valves.

The object of the invention is to provide an irrigation drain valve which dissipates the force of water being drained before discharging the water. A valve body has a large threaded inlet portion adapted to be screwed into an irrigation coupling and also has a large inlet, a tapered portion leading from the inlet to a smaller outlet portion adapted to be screwed into an irrigation coupling, and also has a large inlet, a tapered portion leading from the inlet to a smaller outlet portion with an O-ring seal in a groove in the tapered portion and a cup at the end of the outlet portion to turbulate the water. A valve closure member has a tapered head and a stem, slidable in the body, and a spring urges the head away from the O-ring seal. A nut on the stem limits movement of the valve closure member by the spring. (Sinha-OEIS)
W77-08887

ROTARY WATER SPRINKLER,
Mifal Leyitzur Mamtirim Veavizarei Hashkaya Bekibbutz Dan, Kibbutz Dan (Israel). (Assignee).
O. Katzman.
U.S. Patent No. 3,999,711, 4 p, 1 fig, 5 ref; Official Gazette of the United States Patent Office, Vol 953, no 4, p 1497, December 28, 1976.

Descriptors: *Patents, *Irrigation, *Sprinkler irrigation, *Irrigation practices, *Irrigation efficiency, Application equipment, Pressure.

A rotary water sprinkler has a housing articulatedly rotatable about a central supply coupling with an outflow nozzle fixedly mounted with respect to the housing. The coupling is screw coupled to a supply pipe. With such rotary water sprinklers, the housing and in consequence, the outflow nozzle or nozzles rotate continuously or intermittently as water flows under pressure from the supply and a circular area is sprayed. The outflow pressure can lead to variations. Such variations can be particularly disturbing when a network of sprinklers is employed, each constituent sprinkler being arranged to spray a specific area. A direct cause of such variations in output pressure are variations in the supply pressure in the main or variations in ground level. The object of the invention is to provide a rotary water sprinkler having means to reduce to a minimum the variations in outflow pressure. (Sinha-OEIS)
W77-08888

GRAVITATIONAL IRRIGATION SYSTEM AND METHOD OF INSTALLING,
M. M. Burge.
U.S. Patent No. 4,000,620, 4 p, 5 fig, 8 ref; Official Gazette of the United States Patent Office, Vol 954, no 1, p 137, January 4, 1977.

Descriptors: *Patents, *Irrigation, *Irrigation systems, *Irrigation practice, *Irrigation efficiency, Distribution systems, Application equipment.
Identifiers: Plastic tubing, Drip irrigation.

A gravitational irrigation system uses preformed water-impervious flexible, collapsible plastic tubing. The tubing is laid in a shallow trench adjacent the area to be irrigated. Spades of soil are thrown at spaced intervals over the tubing to hold it in place in the trench. One end of the tubing is con

nected to a source of water and the other end is restricted to control exit of water. Annular apertures are cut in the tubing at intervals along the tubing where exit of water is desired and flexible, open-ended, annular spigots extended through the apertures, allowing water to exit from the tubing. The outer circumference of the spigot has a raised annular ridge on it which mates with a corresponding raised ridge extending around the internal surface of a matching, closed-end cap for the spigot to seal the spigot against exit of water. (Sinha-OEIS)
W77-08895

SPRINKLER HAVING IMPROVED WATER DISTRIBUTION,
M. Drori.
U.S. Patent No. 4,000,853, 6 p, 11 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 954, no 1, p 215, January 4, 1977.

Descriptors: *Patents, *Irrigation, *Sprinkler irrigation, *Irrigation practices, *Irrigation efficiency, Application equipment, Water delivery.

A rotary sprinkler comprises: a sprinkler head connected to a water supply pipe and having a nozzle through which water passes in the form of a jet; a spring-biased pivotably-mounted arm impinged by the water jet and oscillated; and a deflector carried by the arm and oscillated across the path of the water jet. The deflector includes a lower edge placed at an angle to and intercepting the line of impingement as it oscillates back and forth across the path of the water jet so that the lower edge intercepts an increasing area of the water jet section to deflect it downward during one direction of movement of the arm, and a decreasing area to deflect during the opposite direction of movement of the arm. The sprinkled water is therefore distributed uniformly from the sprinkler nozzle. (Sinha-OEIS)

FLOOD PLAIN INFORMATION: ALBUQUERQUE ARROYAS, PART V, ALBUQUERQUE, NEW MEXICO.
Army Engineer District, Albuquerque, New Mex.
Prepared for Albuquerque Metropolitan Arroyo Flood Control Authority, April 1975. 33 p, 4 fig, 18 plates, 5 tab.

Descriptors: *New Mexico, *Floods, Flooding, *Flash floods, *Flood profiles, *Erosion, Deposition(Sediments), *Flood plains, Silting, *Arroyos, *Control structures, Streamflow forecasting, Maximum probable flood, Channels, Obstructions to flow, Non-structural alternatives, Flood plain zoning, Building codes, Zoning, Dams, Diversion structures, Channel improvement, Floodproofing, Arid lands, Arid climates, Rio Grande River.
Identifiers: *Albuquerque Arroyos(NM), Albuquerque(NM), Standard Project Flood, Intermediate Regional Flood.

Flood plains of this study area in the southeast quadrant of Albuquerque remained relatively undeveloped, though there are 250 homes and new construction is gaining momentum as pressures for development continue unabated. Three unnamed arroyos, with a total drainage of about 2.55 sq mi, are studied. Most flood producing storms over this subbasin occur in July and August when almost half of total precipitation occurs. Thunderstorms produce flash floods in summer, but in winter there is little threat of flooding from occurring rainstorms. For an Intermediate Regional Flood, peak discharges of 1,240 cubic ft/sec (cfs), 570 cfs and 430 cfs are predicted for the three arroyos with water velocities in the channel up to 9.6 ft/sec and negligible overbank flow. In a Standard Project Flood peak discharges of 1,700 cfs, 800 cfs and 600 cfs are predicted and velocities up to 10.4 ft/sec with negligible overbank flow. Most bridges and culverts across the arroyos would be obstructive to flood flow. It is assumed that the now-abandoned railroad bridge across one arroyo would wash out. Silting can be a major problem at these obstructions. At the time of this study some of the culverts were partially blocked with silt. Both structural and non-structural flood protection works have been undertaken. These include several dam projects, diversion channels, channel improvements and building regulations. Guidelines for flood management useful to local authorities are set forth. (Smith-North Carolina)
W77-08611

SPECIAL FLOOD HAZARD INFORMATION: ARKANSAS RIVER, FORT DODGE - WILROADS GARDENS, VICINITY OF DODGE CITY, KANSAS.
Army Engineer District, Albuquerque, New Mex.
Prepared for Dodge City and Ford County, KS, June 1970. 8 p, 3 fig, 6 plates, 1 tab.

Descriptors: *Kansas, *Floods, Flooding, *Flood profiles, *Flood plains, Streamflow forecasting, Maximum probable flood, Flood data, Peak discharge, Levee, Dams.
Identifiers: *Arkansas River(KS), Dodge City(KS), *Wilroads Gardens(KS), Standard Project Flood, Intermediate Regional Flood, John Martin Dam(CO).

Developments in the flood plains of this study area are small-acreage farmsteads, buildings, including a hospital and a power plant and several roads. Above Dodge City the watershed of the Arkansas River is 30,600 sq mi including 5,583 sq mi classified as noncontributing. The major contributing sub-basin is controlled 188 mi upstream by John Martin Dam. Stream records are continuous from 1944, but are also available for 1902 1932 from a non-recording gage. In 1921 a flood had a peak discharge of 32,000 cfs, but the 1965 flood was considerably larger at 82,000 cfs, reaching a height of 1.8 feet above a Standard Project Flood (SPF). In Wilroads Gardens waters reached up to 7 feet in some locations and losses were put at $337,000 including damage to roads, utilities, a school and church, 2 businesses and 86 residences. A local levee also failed. The flood resulted from heavy rainfall in the watershed below the dam. Storms of this nature occur frequently in May through August. In an Intermediate Regional Flood (IRF) a peak discharge of 52,000 cfs can be expected along with water velocities of 9.1 feet per second in the main channel and 2.9 ft/sec in the overbank area. A SPF would have a peak discharge of 74,700 cfs and velocities of 10 and 3.1 ft/sec in the main channel and overbank areas, respectively. The IRF would rise to peak in about 14 hours hours and last 45 hours, and the SPF would reach peak in 18 hours and last 62 hours. A major bridge across the stream would not be topped by either flood. Aside from the earth levee, which provides protection for a 30-year flood, no flood control has been undertaken in the area. (Smith-North Carolina)
W77-08612

SPECIAL FLOOD HAZARD INFORMATION REPORT: MISSOURI AND KANSAS RIVERS, KANSAS CITY, KANSAS.
Army Engineer District, Kansas City, Kans.
Prepared for City of Kansas City, KA, January 1972. unp, 2 fig, 6 plates.

Descriptors: *Kansas, *Floods, *Historic floods, *Flood data, *Flood damage, *Flood plains, *Reservoirs, Flood profiles, Control structures, Levee, Floodwalls, Channel improvement, Storm sewers, *Missouri River, *Missouri.
Identifiers: *Kansas River(KA), *Kansas City(KA), Kersey Creek(KA), Standard Project Flood, Intermediate Regional Flood.

The remaining flood hazards within the city of Kansas City (KA) are summarized. Kansas City is located at the confluence of the Kansas and Missouri Rivers and has over 8,000 acres of flood plains of these streams within its city limits. About 7,200 acres has evolved into highly industrialized complexes in several major districts of the city. The areas are flat and conveniently located, each employing thousands of persons. Major floods occurred in 1844 and 1903 when both rivers flooded the area at the same time. In 1951 the uncontrolled Kansas River along produced the most disastrous flood yet recorded. The two earlier events caused relatively little damage in comparison to the 1951 flood which caused $350 million in damages. Failure of the Argentine District levee system, which was uncompleted at the time, signalled the devastation to come for the metropolitan area. Flood waters overwhelmed levees and floodwalls in the important districts of the city. Damages included loss of life. In response to the 1951 flood, raising existing levees, extending floodwalls, storm drainage and channel improvements have been undertaken to protect the city from a flood of a 500-year frequency (Standard Project Flood). Armourdale Industrial District and the Central In-

dustrial District, presently protected against a flood of 100-year frequency (Intermediate Regional Flood), must have floodwalls and levees raised to protect them against a Standard Project Flood. These additional safeguards are planned for completion by 1977. Until all parts of the protective works are completed a flood hazard situation exists. Three additional reservoirs have been authorized for the Kansas River Basin. (Smith-North Carolina)
W77-08613

FLOOD PLAIN INFORMATION: OHIO RIVER, LAWRENCE COUNTY, OHIO.
Army Engineer District, Huntington, W. Va.
Prepared for the State of Ohio, Department of Natural Resources. June 1973. 32 p, 11 fig, 18 plates, 2 tab.

Descriptors: *Ohio River, *Floods, *Flood damage, *Flood profiles, *Flood data, *Historic floods, *Dams, *Reservoirs, *Ohio, Flood flow, Peak discharge, Flow duration, Levees.
Identifiers: Ironton(OH), Intermediate Regional Flood, Lawrence County(OH), Proctorville(OH), Chesapeake(OH), Coal Grove(OH).

In this study area the Ohio River flows southward from Crown City, westward through Huntington, WV and Chesapeake, OH, then northwest for 43 mi along the boundary of Lawrence County. Its flood plains, ranging from 2,000 ft to 8,600 ft. contain commercial and residential development. Floods are caused by excessive rain from widespread spring and winter storms. Floods crest slowly (less than one-half ft per hr) and remain above bankfull for extended periods. Tributary streams and their flood plains experience backwater flooding from the Ohio River. Earthen levees, flood walls and pumping stations at Ironton, OH, protect heavily developed areas of the city. There are no flood plain zoning ordinances, building codes or other regulatory measures intended to reduce flood damage within the study reach. Thirty-seven reservoirs upstream from Ironton significantly reduce flood heights. Eight additional reservoirs are being built. A series of rainstorms created the largest recorded flood in January-February 1937. The flood created 69.4 ft above zero point on gage with an estimated peak discharge of 654,000 cubic feet per second. Ironton was inundated by 11 ft of water and completely isolated from rail and highway travel. The profile of the 1937 flood may be taken as the reasonable upper limit of probable future flooding along this stretch of the river. An Intermediate Regional Flood (IRF) is expected to crest at 552.2 ft mean sea level, 7 ft above the 1937 flood. The town of Proctorville, bottomland surrounding it, portions of Chesapeake and Coal Grove, and all of the bottomland just outside of the Ironton local protection project would be subject to great depths of flooding during an IRF. (Salzman-North Carolina)
W77-08614

FLOOD PLAIN INFORMATION: ASHUELOT RIVER, CITY OF KEENE, NEW HAMPSHIRE.
Army Engineer District, Waltham, Mass. New England Div.
Prepared for the Town of Keene, NH, December 1972. 26 p, 11 fig, 3 plates, 6 tab.

Descriptors: *Floods, Flooding, *Peak discharge, *Flow characteristics, *Flood plains, *Flood protection, *Dams, *New Hampshire, Flood data, Flood stages, Flow duration, Flood damage, Control structures, Obstructions to flow, Snowmelt.
Identifiers: *Ashuelot River(NH), Keene(NH), Faulkner and Colony Dam(NH), Intermediate Regional Flood, Standard Project Flood, Flood Plain Management Program.

The Ashuelot River, a major tributary of the Connecticut River, flows southwesterly in a meandering fashion through Keene, the economic center for the Ashuelot River watershed. With a negligible slope in the study area, the river channel has little discharge capacity and considerable depth of ponding is possible in the flood plain. The flood plains contain much residential, commercial and industrial property and pressure for development is increasing. Main flood season is in the spring when floods result from rains combined with melting snow. Intense rainfall from local thunderstorms also cause floods. A steep upper watershed area contributes to rapid runoff in the flood plain at Keene. Although the Faulkner and Colony Dam has no flood control capacity, 2 flood control dams in the upper watershed provide some protection. The city of Keene is responsible for operation and maintenance of the local protection project completed in 1954. Located along the Ashuelot River from the railroad bridge in Keene to the covered bridge at Swanzey Station, the improvement increases the usability of farm lands along the river and aids functioning of the drainage and sewerage systems. The flood with the greatest peak discharge occurred in 1938 when a flow of 18,800 cubic feet per second was recorded and a water epth of 475.3 mean sea level datum at telemark gage in Keene. An Intermediate Regional Flood and a Standard Project Flood would crest at 471.7 and 472.7 ft msld, respectively, and have peak discharges of 18,800 cfs and 22,000 cfs. This report furnishes a suitable basis for the adoption of land use controls and flood damage reduction techniques to develop a flood plain management program. (Salzman-North Carolina)
W77-08615

SPECIAL FLOOD HAZARD REPORT: BUFFALO CREEK, MEADOW GROVE, NEBRASKA.
Army Engineer District, Omaha, Nebr.
Prepared for the Village of Meadow Grove and the Nebraska Soil and Water Conservation Commission, June 1971. 14 p, 2 tab, 3 plates, 4 fig.

Descriptors: *Floods, *Peak discharge, *Flood plains, *Flood protection, *Channel improvement, *Nebraska(NB), *Flood profiles, Flooding, Historic floods, Flood data, Flow characteristics, Flood damage, Flood routing, Obstruction to flow.
Identifiers: *Buffalo Creek(NB), Meadow Grove(NB), Intermediate Regional Flood, Standard Project Flood.

This report was prepared to define the remaining flood threat along Buffalo Creek as it passes through Meadow Grove after construction of a proposed channel improvement project which should reduce flood damages about 80%. Buffalo Creek, which drains 21 square miles, has short tributaries that are sharply eroded into the hills along the creek as it meanders through the basin. The flood plain, relatively narrow in the upper basin, spreads out without definable limits. Deposition of silt from earlier floods has created somewhat higher ground close to the creek. A railway bridge, the bridge at Highway 275 and the Lewis Street extension limit flood flows. Floods usually result from severe thunderstorms and are characterized by rapid peaking and short duration. Most of Meadow Grove is subject to flooding by major floods. Six major floods have occurred in the past 33 years. In May 1944 a flood which had a peak discharge of 6,200 cubic feet per second caused damages of $144,000 at 1970 prices. In 1960 the largest flood caused damage estimated at $149,000. The improved channel will be nearly three times as wide as the old channel with sharp curves eliminated. Flow not exceeding 5,400 cfs can be carried in the new channel without overbank flooding. An intermediate Regional Flood would have a peak discharge of 9800 cfs or 58% greater than the 1944 flood. A Standard Project Flood would have a peak discharge of 19,400 cfs inundating most of the village. 'Depths of overbank flow would be shallow, usually less than 2 feet, except at the upstream side of road crossings where depths may be greater.' (Hufschmidt-North Carolina)
W77-08616

FLOOD PLAIN INFORMATION REPORT, INDIAN AND DRY CREEKS, LINN COUNTY, IOWA.
Army Engineer District, Rock Island, Ill.
Prepared for the Iowa State Natural Resources Council, December 1969. 27 p, 2 tab, 12 plates, 11 photos.

Descriptors: *Floods, *Flood control, *Flood data, *Flood profiles, *Non-structural alternatives, *Iowa, Historic floods, Flood frequency, Flood plain zoning, Building codes, Flood peak, Flood plains, Standard Project Flood.
Identifiers: *Cedar Rapids(IA), Dry Creek(IA), Indian Creek(IA), Marion(IA), Hiawatha(IA), Linn County(IA), Intermediate Regional Flood, Encroachment lines.

The study area involves 93.0 square miles of the Indian Creek and Dry Creek watershed in Linn County, IA, including the cities of Cedar Rapids, Marion, and Hiawatha. Development in the flood plain is not extensive, consisting primarily of agricultural land with scattered industrial and residential sites. Damage from past floods has consequently been light. Extensive future developments in the flood plain are anticipated due to population growth trends. Data were obtained from county records, newspaper files, and historical documents. Flooding usually occurs in the late winter and early spring and is caused by snowmelt, heavy general rains, or both. Intense local storms can cause floods at other times. Recent major floods occurred in January and April 1960, and March and November 1961. As in many previous years, damage was concentrated in lower flood plain, in and around Cedar Rapids. At the lower study limit, the Intermediate Regional Flood will discharge 22,000 cubic feet/sec, and the Standard Project Flood will discharge 31,100 cfs. Additional flood plain development will increase flood crest levels. Although intended for informational purposes, this report also describes non-structural flood control measures, including encroachment lines, zoning, subdivision regulations, building codes, and flood control regulations. (Nessa-NC)
W77-08617

FLOOD HAZARD INFORMATION: YAMPA RIVER AND TRIBUTARIES, STEAMBOAT SPRINGS, COLORADO.
Army Engineer District, Sacramento, Calif.
Prepared for Routt County Regional Planning Commission, February 1976. 13 p, 3 fig, 5 tab, 27 plates.

Descriptors: *Floods, Flooding, *Peak discharge, *Flood profiles, *Snowmelt, Flood data, Flood stages, Flow characteristics, Flood plains, Planning, Historic floods, *Colorado.
Identifiers: *Yampa River(CO), Soda Creek(CO), Butcherknife Creek(CO), Spring Creek(CO), Fish Creek(CO), Walton(CO), Burgess Creek(CO), *Steamboat Springs(CO), Intermediate Regional Flood, Standard Project Flood.

This report covers the Yampa River, a tributary of the Colorado River via the Green River, for 6.4 mi and lower reaches of its tributaries, Soda, Butcherknife, Spring, Fish, Walton and Burgess Creeks. All direct tributaries join the river in Steamboat Springs, a ski resort with a permanent population of about 5,000 supplemented by an almost equal number of winter transients plus summer tourists. Much of the annual precipitation occurs as snow and a deep snowpack develops. In late spring through early summer snowmelt augmented by rain causes flooding. General rainstorms over the Yampa River Basin have not caused significant floods. However, major flood producing rainstorms occur over western CO in September and October. Major floods occurred in June 1921 and April 1974 with the former having a peak discharge of 7,000 cubic ft per second on the Yampa, an estimated 2,000 cfs along Soda Creek. In 1974 stages on all streams in the Steamboat Springs area were higher than at any time in recent history. Many homes were damaged. Most bridges

LIBRARY U. OF I. URBANA-CHAMPAIGN

nd culverts in the city impede flood flow. There re no flood control projects in the study area. Using a standard project storm centered over the Grand Mesa area, estimates were made for peak flows in study area: for a 100-year flood (cfs)- Yampa River at Steamboat Springs 8,000; Soda Creek 1,300; Butcherknife Creek 320; Spring Creek 650; Fish Creek 1,800; Walton Creek 2,700; Burgess Creek 260. For a 500-year flood(cfs)- Yampa River 20,000; Soda 2,900; Butcherknife 1,300; Spring 2,400; Fish 4,600; Walton 5,600; Burgess, 1,400. Main channel velocities for Yampa River would average 10 ft/sec in a 100-year flood which could inundate about 670 acres. (Salzman-North)
W77-08619

FLOOD PLAIN INFORMATION: LLAGAS CREEK UNIT I, INCLUDING EDMUNDSON (LITTLE LLAGAS), CHURCH, SAN MARTIN, NEW, CENTER, CORRALITOS, TENNANT, MAPLE, AND FOOTHILL CREEKS, SANTA CLARA COUNTY, CALIFORNIA.
Army Engineer District, San Francisco, Calif.
Prepared for Santa Clara Valley Water District, CA, July 1975. 31 p, 22 fig, 44 plates, 6 tab.

Descriptors: *California, *Floods, *Flash flood, *Flood profiles, *Flood plains, *Reservoirs, *Flood control, Flooding, Overflow, Streamflow forecasting, Design flood, Historic floods, Flood data, Peak discharge, Bank erosion, Obstructions to flow, Control structures, Water storage, Diversion structures, Channel improvement.
Identifiers: *Llagas Creek(Calif), *Edmundson Creek(CA), *Little Llagas Creek(CA), Standard Project Flood, Intermediate Regional Flood, San Martin Creek(CA), Corralitos Creek(CA), Foothill Creek(CA), New Creek(CA), Tennant Creek(CA), Chesbro Reservoir(CA), Church Creek(CA), Center Creek(CA), Maple Creek(CA).

Watersheds of Unit I are located on both east and west sides of South Santa Clara Valley. West side watersheds include upper reaches of Llagas Creek, Edmundson (Little Llagas) Creek and West Little Llagas Creek. East side watersheds include upper reaches of Church, New, Center, Corralitos, Tennant, Maple and Foothill Creeks. Most of the flood plain lands have agricultural uses but intensive residential and commercial development is anticipated. Most precipitation occurs from December through March with 18 to 45 inches annual precipitation on the west side, about 18 inches on the east side. Floods rise quickly, do not last long. Chesbro Reservoir on Llagos Creek, built in 1955, provides some degree of flood protection. In an Intermediate Regional Flood (IRF) a peak discharge of 5,600 cubic feet per second is expected on Llagos Creek and peak discharges of generally less than 1,000 cfs on tributaries in the Llagas Creek area. Water velocities could be from 4 to 17 ft/sec in upper reaches and 4 to 14 ft/sec in lower reaches. Overbank flow is predicted at 1 to 4 ft/sec. In a Standard Project Flood, peak discharges of 6,300 cfs on Llagas Creek are predicted, with as much as 1,400 cfs on smaller tributaries. Water velocities will be slightly higher than in the IRF. In either flood, overflow from water courses is expected. Sixteen of 22 bridges are expected to obstruct flood flow. Some additional flood protection measures undertaken are the partially implemented Upper Llagas Creek Watershed Work Plan and construction of a new channel which will divert some creeks. Construction of a supplementary water supply to the nearby Hayes Valley could reduce peak flows on Llagas Creek. (Smith-North Carolina)

TIME-OF-TRAVEL STUDY, BLACK RIVER FROM LYONS FALLS TO DEXTER, NEW YORK,
Geological Survey, Albany, N. Y. Water Resources Div.
H. L. Shindel, and L. A. Wagner.
New York State Department of Environmental Conservation, Albany, Report of Investigations RI-16, 1977. 18 p, 6 fig, 4 tab, 10 ref.

Descriptors: *Streamflow, *Travel time, *Path of pollutants, *Tracking techniques, *Dye releases, *New York, Flow rates, Dye concentrations, Data collections, On-site investigations, Forecasting.
Identifiers: *Black River(NY), Lyons Falls-Dexter area(NY).

Time of travel of water was determined at three different times for 16 successive subreaches of the 72-mile reach of the Black River between Lyons Falls and Dexter, New York. A 40-percent solution of rhodamine B dye and 20-percent solution of rodamine WT dye were used on different occasions as tracers to measure the time of travel. Cumulative time of travel of the peak dye concentration was 115 hours for a flow of about 40-percent duration and 173 hours for a flow of about 85-percent duration. Time-of-travel data for each subreach and cumulative time-of-travel graphs for the entire reach for various discharges are presented. Dye-dispersion and peak-concentration data are give also. Graphs show the relationship between traveltime and peak dye concentration for different rates of discharge through the subreaches. (Woodard-USGS)

EFFECT OF PONDS AND SMALL RESERVOIRS ON RIVER RUNOFF IN THE FOREST-STEPPE AND STEPPE ZONES OF THE VOLGA BASIN,
V. Z. Rodionov.
Soviet Hydrology, Selected Papers, No. 4, p 288-295, 1975. 2 fig, 5 tab, 13 ref. Translated from Trudy Gosudarstvennogo Gidrologicheskogo Instituta, No. 229, p 106-122, 1975.

Descriptors: *Runoff, *Ponds, *Reservoirs, Effects, Grasslands, Forests, Storage, Water storage, Evaporation, Reservoir evaporation, Watersheds(Basins), Ravines, Foreign countries, Foreign research, Gullies, Rivers, Streams.
Identifiers: *Volga Basin(USSR), *USSR.

The forest-steppe and steppe zones of the Volga basin include the Central Russian Upland, the northern part of the Oka-Don valley, and the Volga Hills. This area extends for more than 1000 km from west to east. The mentioned territory belongs mainly to the zone of deficient moisture, where most of the river runoff occurs during the spring flood period. The numerous ponds and reservoirs of the dry zones are desinged for spring flood runoff storage and for its utilization during the low-flow period for industrial purposes (mainly irrigation and water supply). The effect of ponds and reservoirs on the runoff or rivers of the forest-steppe and steppe zones of the Volga basin obeys the law of geographic zonality. The change in runoff increases from the northwest to the southwest as river water utilization increases and the total river flow decreases. The reduction in the runoff of rivers in the zone of sufficient and variable moisture is 1% in a moderately wet year and 2% in a dry year The reduction for rivers in the moisture deficient zone averages 3 and 6%, respectively, and in the dry zone, reduction reaches 24 and 4%. Because of the mentioned mass construction of ponds and reservoirs everywhere, the change in river runoff will be more considerble, especially in the dry regions of the Volga basin. (Sims-ISWS)

ECONOMIC ROLE OF THE WATERWAY IN WESTERN EUROPE,
Port of Strasbourg (France).
M. Marchal.
Journal of the Waterways, Harbors and Coastal Engineering Division, Proceedings of the American Society of Civil Engineers, Vol. 102, No. WW3, Proceedings paper No. 12346, August 1976, p 337-346. 2 tab, 1 ref.

Descriptors: *Channels, *Transportation, *Regional development, Canals, Canal design, Planning, Costs, Navigation.
Identifiers: *Economic analysis, *Industrial growth, *Western Europe, *Waterways, Economic decentralization, Ocean ports, Impact.

Thanks to the development of new, highly efficient techniques of navigation, inland navigation along large gage canalized waterways can offer an efficient, modern, and cheap mode of transportation. In Western Europe, the waterway is not only a mode of transportation, but its improvement can serve urban development, create recreational facilities, and help in flood control. The specific impact of large gage waterways on the economic and industrial development is the result of (1) the assurance that industries located in their vicinity still simultaneously experience a substantial and permanent decrease of their transportation costs and an increase in their size and influence; and (2) additional advantages offered to factories located on their banks, resulting in increased profit margins and reinvestments capabilities. Such advantages can only be felt, however, if the waterway crosses regions of high urban and industrial density and links zones of development of sufficient economic dimensions. (Bell-Cornell)

Identifiers: *Stream channelization, Non-channelized streams, *Swamp forest ecosystems, Gates County(NC).

The general objective was to develop better understanding of the swamp forest ecosystem, including its dominant and subsidiary vegetation communities, its associated fauna, soil properties and surface stratigraphy, and the hydrology in relation to alterations of the 'natural' drainage regime. Sixteen well lines were established, representing eight channelized situations and eight non-channelized situations in ten stream bottoms from Craven County northward to Gates County, N.C., covering over a hundred miles of Coastal Plain. Within each of the eight well-line categories, 4 lines are in recently cut-over tracts and 4 are within tracts that have not seen logging activities for several decades. Some tentative conclusions from the first year's study are: (1) The swamp forest ecosystems of eastern North Carolina are largely dominated by quantities of cull trees which are the residual elements from high-grading logging operations during the past 150 years or more. (2) Surface soils to depths of 40 cm or so are quite uniform in texture and composition, with texture averaging 70 to 80 percent clay. (3) Channelized streams maintain perennial and clear flow during droughty periods in sharp contrast to the murky water in natural streams during low flow. (4) Clear-cutting substantially affects the soil moisture regime because of the temporary reduction in evapotranspiration draft. (Stewart-NC State)

LIBRARY U. OF I. URBANA-CHAMPAIGN

*Distribution systems, *Methodology, Design, *Algorithms.
Identifiers: Operations planning, Water demand forecasting, Storage forecasting, Control software implementation.

Results are presented of a project that was directed to the development of prototype algorithms for real-time computer control of water distribution systems. The objective was to improve the capability of a water system operator/dispatcher to control the operation of this system. This is accomplished by providing computerized 'tools' which forecast and simulate system conditions, allowing the dispatcher to estimate the consequences of his control decisions before he takes action. The approach, briefly stated, is to use a reduced network model and system load forecast to simulate operation of the water system (i.e., determine the storage forecast in order to provide information to the system controller (human dispatcher or computerized optimization algorithm) which will aid in dispatching the system to meet all constraints and requirements at the lowest possible cost. Part I of this report is an overview of the work done, Part II, an Implementation Guide, describes the steps to be taken by a water utility to implement on its own system the techniques and programs described here. Part III consists of Technical Appendices describing in detail the structure and derivation of the algorithms developed. Part IV is the documentation of computer programs. Descriptors: *Computer programs, *Water distribution(Applied), Water demand, Computer models, Forecasting, Estimating, Water control, Documentation, Methodology.
Identifiers: Computer program documentation.

This documentation covers computer programs associated with analysis and forecasting of water demand and related data. The programs can be divided into four categories: initialization, estimation, forecasting, and verification. (1) The initialization programs provide a beginning for analysis; these are subroutines which produced printer plots--histograms, time series plots, and scatter plots. The routines can be used to plot water demand over time, to plot water demand versus particular weather variables, etc., in order to understand the structure of the data. The subroutines can also be used to plot results of statistical analyses for purposes of clarification; the plotting routines are described in a separate section. (2) Helpful in leading towards a particular forecasting model are the estimation programs. One program performs quadratic regression and other performs correlation and auto-correlation analysis and for determining a forecasting model based on exogenous variables, principal components analysis is documented. (3) Forecasting programs have been developed (using San Jose Water Works data) to be used in total or adapted. The stochastic forecasting model is documented, as is a forecasting program based on weather variables. (4) Two programs were written which help to determine the accept-ability of the forecasting model. A program is described which analyzes the residuals (differences between forecasted and actual demand) produced by a single forecasting model. Also a program is described that analyzes the residuals of the stochastic and weather models jointly. (See also W77-08940 and W77-008942)

FLORIDA'S BARGE CANAL PROSPECTS FOR THE FUTURE,
Florida State Univ., Tallahassee. Dept. of Ichthyology.
H. A. Beecher.
National Parks and Conservation Magazine, Vol 48, No 9, p 14-19 (1974). 1 map, 7 photo.

Descriptors: *Florida, *Canals, *Canal construction, *Canal design, *Environmental effects, Environmental control, Environmental engineering, Environment, Canal embankments, Channels, Engineering structures, Hydraulic structures, Civil engineering, Design flow, Ditches, Inland waterways, Saline water intrusion, Excavation.
Identifiers: *Injunctive relief, Cross-Florida Barge Canal.

Evaluated in this article are the past history and future prospects of the Cross-Florida Barge Canal. Although the idea for such a canal was originally conceived in the early 1800's, actual construction did not begin until the depression when it was maintained for a year to provide jobs for the unemployed. Construction began again in 1964 and continued until January, 1971, when a temporary injunction necessitated its halt. Conflicting reports have been produced by both sides of the construction issues and have resulted in many false predictions concerning the economic advantages of the canal and its effect upon the mid-Florida environment. The author urges that action be commenced to make the best of the existing structures while construction is halted. The main focus should be upon the Ocklawaha River and Rodman Reservoir, and should include river monitoring and objective experimentation. If the long range plans are to maintain the reservoir as such, then disposal of the sediment which will be quickly deposited during the rainy seasons will have to be arranged. (Welch-Florida)

COMPUTER APPLICATIONS FOR STEP-BACKWATER AND FLOODWAY ANALYSES,
Geological Survey, Bay Saint Louis, Miss. Water Resources Div.
J. O. Shearman.
Open-file report 76-499, 1976. 103 p, 63 fig, 18 tab, 10 ref, append.

Descriptors: *Backwater, *Computer models, *Flow profiles, Encroachment, Gradually varied flow, Land use, Planning, Floodways, Flood plain insurance, Input-output analysis, Evaluation, *Computer programs.

A computer program which can be used to computer water-surface profiles for gradually varied, subcritical flow is described. Profiles are computed by the standard step-backwater method. Water-surface profiles may be obtained for both

existing stream conditions and for stream conditions as modified by encroachment. The user may specify encroachment patterns in order to establish floodway limits for land-use management alternatives, or for flood-insurance studies. Applicable theories, computer solution methods, data requirements, and input data preparation are discussed in detail. Examples are presented to illustrate the computer output and potential program applications. (Woodard-USGS)

LAND SUBSIDENCE,
National Water Well Association, Worthington, Ohio.
T. E. Gass.
Water Well Journal, Vol 31, No 5, p 30-31, May, 1977. 1 fig.

Descriptors: *Land subsidence, *Pumping, *Water wells, Groundwater recharge, Pores, Aquifers, Clays.
Identifiers: Unconsolidated materials.

Well contractors who operate in certain areas of the U.S. Southwest are probably quite familiar with the phenomenon of land subsidence. In areas that have experienced this problem, similar geological conditions are present: (1) the surface is underlain by unconsolidated or semi-consolidated formations; (2) there is a considerable clay content in the formation, and; (3) ground water withdrawal exceeds recharge. When more water is pumped out of loose granular material than is put back in, pore spaces are emptied and gradually close. The resulting land subsidence can cause costly damage to the land surface and to structures on the surface, as well as permanently reducing the ground water storage capacity of the region. Subsidence can also occur around wells that pump sand and finer particles. Land subsidence can be prevented by careful examination of subsurface formations before well development and by taking reasonable steps to manage the regional water supply afterwards. (Eberle-NWWA)

GEOPHYSICAL EXPLORATION FOR POTABLE GROUNDWATER SUPPLIES IN THE KALAHARI GEMSBOK NATIONAL PARK,
Ruker (Richard) and Associates, Bryanston (South Africa).
E. Martinelli.
Water S.A., Vol 1, No 2, p 53-56, July, 1975. 3 fig, 1 tab.

Descriptors: *Resistivity, *On-site investigations, Electrical studies, Saline water-freshwater interfaces, Water supply, Africa, Groundwater resources.
Identifiers: *Vertical Electric Soundings Techniques, Kalahari Gemsbok National Park(South Africa), Freshwater lenses.

Electrical resistivity survey techniques were recently used to locate and delineate fresh water lenses as sources for future water supply in the Kalahari Bemsbok National Park. Two existing wells had been drawing water of poor quality (about 10,000 ppm dissolved solids). Information from exploratory boreholes indicated that lenses of fresh water overlay deeper brackish water bodies in the area. After determining formation porosity and resistivities of the local fresh and saline ground waters via laboratory tests, field surveys of the formation were ready to be undertaken and 75 electrical soundings eventually were completed. One large continuous lens was discovered in the survey area and three subsequent boreholes into the lens produced good supplies of drinking water. (Eberle-NWWA)

GROUNDWATER POLICIES NOW LEAN TOWARDS MANAGEMENT.
Irrigation Age, Vol. 11, No. 8, p 40, May-June, 1977.

Descriptors: *Water management(Applied), *Water policy, *Irrigation wells, *Irrigation design, Water distribution(Applied), Well permits, Well regulation, Water conservation.

During the last century, agriculture has emphasized ground water development – the emphasis has now shifted to management and maintenance of ground water reserves. Four objectives which authorities agree are crucial are prolonging aquifers' useful lives and maintaining water levels, providing equitable distribution methods, minimizing conflicts between users, and minimizing administrative costs and problems. Increased efficiency and elimination of waste in ground water utilization are high priority concerns for designing specific areal management systems and integrating all sources of water conjunctively used for irrigation and water supply. Well spacing requirements, permits to drill, allocation / water rights, and rotational use are the tools by which planners can reach rational management goals in years ahead. (Eberle-NWWA)

GEOTHERMAL ENERGY DEVELOPMENT,
Los Alamos Scientific Lab., N. Mex.
J. C. Rowley.
Physics Today, Vol. 30, No. 1, p 36-45, January, 1977. 7 fig, 1 tab, 24 ref.

Descriptors: *Thermal power, *Drilling, *Geologic investigations, Research and development, *Geothermal studies, Thermal water, Geophysics, Corrosion, Drilling equipment, Logging(Recording), Energy.
Identifiers: Geopressurized systems, Dry hot rock systems, Magma systems, Rock melting drilling, Electric spark disintegration drilling.

Although the heat reservoir of the earth's interior is a promising source of energy for the future, technology will need to be developed to more readily access geothermal resources. In addition to steam and hot water geothermal systems, geopressurized systems (high-pressure brine and methane), dry hot rock systems, and magma systems could theoretically be exploited for energy production. The limiting factors preventing more widespread use of these resources today are the need for more efficient and cost-effective techniques of geothermal exploration and concomitant advances in geophysial modeling, problems with drilling into harsh environments, and corrosion of generating equipment due to high saline content of geothermal fluids. Regarding the drilling process, corrosion resistant drill string and bit materials are needed to eliminate the costly problem of drill string twist-off so common when drilling into geothermal reservoirs by conventional means. Advanced techniques such as rock melting and electric spark disintegration may prove to be excellent approaches for hot rock drilling in years to come. (Eberle-NWWA)

FAULT CONTROL OF SUBSIDENCE, HOUSTON, TEXAS,
Texas Univ. at Austin. Bureau of Economic Geology.
C. W. Kreitler.
Ground Water, Vol. 15, No. 3, p 203-214, May-June, 1977. 13 fig, 18 ref.

Descriptors: *Land subsidence, *Faults(Geology), *Water table, *Texas, Pumping, Flood damage, Groundwater basins, Groundwater barriers.
Identifiers: *Houston-Galveston area(Texas), Differential compaction.

The Houston-Galveston area of Texas which already has sustained millions of dollars in damage due to land subsidence is threatened with greater loss as this subsidence continues. The conclusions of this paper suggest that the surface faults that interlace the area and control drainage patterns are primarily activated by differential compaction of the underlying aquifer; these faults also appear to be hydrological barriers. The faults compartmentalize land subsidence into several individual basins, thus, pumpage from one fault-bound basin may not adversely affect another. It is urged that such evidence be well considered before future releveling surveys are undertaken. (Eberle-NWWA)

THERMAL WATERS IN TAIWAN, A PRELIMINARY STUDY,
Mining Research and Service Organization, Taipei (Taiwan).
C. Chen.
In: Thermal and Chemical Problems of Thermal Waters, Proceedings of the Grenoble Symposium, August/September, 1975. p 79-88, 3 fig, 1 tab, 13 ref.

Descriptors: *Geothermal studies, *Geochemistry, Heated water, Hydrothermal studies, Hydrogen ion concentration, *Thermal water.
Identifiers: *Taiwan.

Approximately 80 hot-spring and fumarolic areas in Taiwan are reported with most of them being located in the Miocene, Paleogene, and pre-Tertiary metamorphic terranes. The two explored geothermal fields are Tatun and Tuchang. The Tatun belt is apparently of volcanic origin and the geothermal power potential is estimated to be at least 80-200 MW. Large scale exploitation has been hampered by the corrosion problem rendered by the acid fluid. It is suggested that the Tuchang belt could be another important belt capable of immediate exploitation. The Tuchang field produces sodium bicarbonate water with a pH around 8.5 and temperatures up to 173C. The Tatun field contains acid sulphate chloride water with a pH of about 2 and temperature up to 193C. (See also W77-08677) (Chilton-ORNL)

National Technical Univ., Athens (Greece). Institute of Mineral Layings, Science and Applied Geology.
C. Garagouins, and C. Dimitroulias.
In: Thermal and Chemical Problems of Thermal Waters, Proceedings of the Grenoble Symposium, August/September, 1975. p 128-134, 20 ref.

Descriptors: *Geothermal studies, *Thermal water, *Heated water, Hydrology, Energy, *Hot springs.
Identifiers: *Greece(Neovolcanic regions).

The neovolcanic regions of Greece are identified. Some thermal springs are found to mix with other waters before reaching the surface and there by lose part of their heat. The study suggests that it would be possible to capt warm water at depth and to obtain high temperatures. The possibilities of energy production from waters ranging from 60-100 C is discussed. SIMULATIONS OF WATER-LEVEL DRAWDOWNS IN PROPOSED WELL-FIELD AREAS, DADE COUNTY, FLORIDA,
Geological Survey, Tallahassee, Fla. Water Resources Div.
H. Klein.
Open-file report 76-651, September 1976. 14 p, 9 fig, 1 ref.

Descriptors: *Model studies, *Drawdown, *Aquiers, *Pumping, *Florida, Water wells, Networks, Feasibility studies, Analog models, Evaluation, Projections.
Identifiers: Dade County(Fla), *Biscayne aquifer(Fla).

Electrical analog model simulations of hydraulic conditions in the Biscayne aquifer were made at proposed inland well-field sites in Dade County, Florida. Simulated drawdowns of water levels after 7 months of continuous pumping at 50, 100, and 150 million gallons per day were obtained at each site. Simultaneous pumping of each of the sites at 50 million gallons per day showed that after 7 months pumping there would be interference between proposed well fields. (Woodard-USGS)

OUTLINE OF THE WATER RESOURCES OF THE SATUS CREEK BASIN, YAKIMA INDIAN RESERVATION, WASHINGTON,
Geological Survey, Tacoma, Wash. Water Resources Div.
D. Molenaar.
Open-file report 76-808, 1977. 34 p, 20 fig, 23 ref.

Descriptors: *Available water, *Streamflow, *Groundwater resources, *Aquifer characteristics, *Irrigation, *Indian reservations, *Washington, Hydrogeology, Surface-groundwater relationships, Saturated soils, Hydrologic budget, Evaluation, Watershed management.

Identifiers: *Yakima Indian Reservation(Wash), *Satus Creek basin(Wash).

On the Yakima Indian Reservation, Washington, only about 5 percent of the Satus Creek basin--in the relatively flat eastern lowland adjacent to and including part of the Yakima River lowland--is agriculturally developed, mostly through irrigation. Because the basin's streams do not contain adequate water for irrigation, most irrigation is by canal diversion from the adjoining Toppenish Creek basin. Irrigation application of as much as 9.25 acre-feet per acre per year, combined with the presence of poorly drained silt and clay layers in this area, and the natural upward discharge of ground water from deeper aquifers (water-bearing layers), has contributed to a waterlogging problem, which has affected about 10,500 acres, or about 25 percent of the irrigated area. In the upland of the basin, a large average annual base flow of about 30 cubic feet per second in Logy Creek indicates the presence of a potentially highly productive aquifer in young (shallow) basalt lavas underlying the higher western parts of the upland. This aquifer may provide a reservoir from which streamflow may be augmented by groundwater pumping or, alternatively, it may be used as a source of ground water for irrigation of upland areas directly. (Woodard-USGS)
W77-08740

WATER-LEVEL CHANGES IN NORTHWESTERN KANSAS, 1950-76,
Geological Survey, Lawrence, Kans. Water Resources Div.
M. E. Pabst, and E. D. Jenkins.
Kansas Geological Survey Journal, Lawrence, December 1976. 20 p, 2 fig, 2 plates, 2 tab, 14 ref.

Descriptors: *Groundwater resources, *Withdrawal, *Water utilization, *Water level fluctuations, *Kansas, Irrigation, Drawdown, Hydrologic data, Well data, Aquifers, Data collections.
Identifiers: Northwestern Kansas.

The water level in wells has declined as much as 44 feet (13 meters) since 1950 in areas of greatest development in northwestern Kansas, primarily as a result of groundwater withdrawals for irrigation. During 1950-76, the number of irrigation wells increased from about 100 to 3,050, and annual withdrawals are estimated to have increased from 15,000 to 600,000 acre-feet (18 to 740 cubic hectometers). Most of the water used in northwestern Kansas is withdrawn by wells screened in the Ogallala Formation of Pliocene age. The Ogallala consists primarily of sand and gravel that contains lenses of clay and silt. (Woodard-USGS)
W77-08742

ARTIFICIAL RECHARGE FOR SUBSIDENCE ABATEMENT AT THE NASA-JOHNSON SPACE CENTER, PHASE I,
Geological Survey, Austin, Tex. Water Resources Div.
S. Garza.
Open-file report 77-219, 1977. 82 p, 23 fig, 7 tab, 21 ref.

Descriptors: *Land subsidence, *Groundwater, *Withdrawal, *Artificial recharge, *Injection wells, Model studies, Aquifers, Hurricanes, Floods, Feasibility studies, Methodology, Evaluation, *Texas.
Identifiers: *NASA-Johnson Space Center(Tex), Houston area(Tex).

Regional decline of aquifer head due to groundwater withdrawal in the Houston area has caused extensive land-surface subsidence. The NASA-Johnson Space Center (NASA-JSC) in southeastern Harris County, Texas, was about 13 to 19 feet above mean sea level in 1974 and sinking at a rate of more than 0.2 foot per year. NASA-JSC officials, concerned about the hurricane flooding hazard, requested the U.S. Geological Survey to study the feasibility of artificially recharging the aquifers for subsidence abatement. Hydrologic digital models were developed for theoretical determinations of quantities of water needed, under various well-array plans, for artificial recharge of the Chicot and Evangeline aquifers in order to halt the local subsidence at NASA-JSC. The programs for the models were developed for analysis of three-dimensional ground-water flow. Total injection rates of between 2,000 and 14,000 gallons per minute under three general well-array plans were determined for a range of residual clay pore pressures of 10 to 70 feet of hydraulic head. The space distributions of the resultant hydraulic heads, illustrated for injection rates of 3,600 and 8,400 gallons per minute, indicated that, for the same rate, increasing the number and spread of the injection locations reduces the head gradients within NASA-JSC. (Woodard-USGS)
W77-08744

WATER FOR INDUSTRIAL AND AGRICULTURAL DEVELOPMENT IN ATTALA, HOLMES, HUMPHREYS, ISSAQUENA, SHARKEY, AND YAZOO COUNTIES, MISSISSIPPI,
Geological Survey, Jackson, Miss. Water Resources Div.
J. M. Bettandroff, and S. A. Leake.
Mississippi Research and Development Center, Jackson, 1976. 68 p, 24 fig, 10 tab, 38 ref.

Descriptors: *Water resources, *Surface waters, *Groundwater, *Water quality, *Water utilization, *Mississippi, Hydrologic data, Streamflow, Sediments, Water wells, Aquifer characteristics, Water yield, Water pollution sources, Chemical analysis, Water supply, Water demand.
Identifiers: West-central Mississippi.

Ground water is the major source of industrial and agricultural water supplies in Attala, Holmes, Humphreys, Issaquena, Sharkey, and Yazoo Counties, Miss. A total of 5,416 million gallons per day were used for public and industrial supply in 1975; agricultural use for the year was 45,000 acre-feet. Average runoff contributed by the study area to the river basins is 3,000 million gallons per day. The average flow of the Mississippi River past the area is 360 billion gallons per day. The surface water is chemically suitable for most uses; however, some streams contain relatively high concentrations of iron, large amounts of sediment, or high color. Agricultural chemicals have impaired the quality of the stream and lake system. The fresh-ground-water section is 500 to 3,000 feet thick. The lower Wilcox aquifer, the Meridian-upper Wilcox aquifer, the Sparta aquifer system, and the Cockfield Formation are the major sources of ground-water supplies and are capable of supplying one million gallons per day or more to well fields in most areas. Water is highly mineralized in downdip areas of these aquifers. Iron and low pH cause problems locally in water supplies. The Mississippi River valley alluvial aquifer can supply several million gallons per day to well fields; however, the water is hard and contains excessive iron. (Woodard-USGS)

SURFACE-GROUNDWATER INTERACTIONS AND THE CONJUNCTIVE USE OF THE WATER RESOURCES OF THE MULLICA RIVER BASIN, NEW JERSEY,
Rutgers - The State Univ. New Brunswick N. J. Dept. of Civil and Environmental Engineering.
R. Ahmed.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-268 908. Price codes: A10 in paper copy, A01 in microfiche. Ph.D. Thesis, January 1973. 210 p, 19 figs, 28 tabs, 3 app. 88 ref. OWRT A-025-NJ(8) B-014-NJ(6) and A-025-NJ(8).

Descriptors: *River flow, Subsurface flow, Inflow, *Surface-groundwater relationships, *Aquifers, *Conjunctive use, Streamflow, *New Jersey, Groundwater movement, *Darcys law, *Continuity equation, Computer models.
Identifiers: *Mullica River Basin(NJ).

A fundamental equation describing transient two-dimensional flow through an aquifer was developed using Darcy's law, and the continuity equation. The resulting equation was a nonlinear parabolic partial differential equation. The resulting equation was solved numerically on the digital computer. An Alternating Direction Explicit Technique was employed to solve the flow equation for the head at any point in the basin under consideration and the amount of water exchange between stream and aquifer. The efficiency and accuracy of the digital model were checked by comparing the calculated values against analytical solutions for a homogeneous isotropic aquifer of simple geometry. Results of the comparison were satisfactory. Trend surface analysis was performed on available hydro-geologic data for the groundwater aquifer in the Mullica River Basin, New Jersey. A general linear model was utilized to extrapolate the values of the parameters to any point in the basin. Natural recharge values were obtained from calculated potential recharge values for the Batsto and the Oswego sub-basin. The digital computer model for the groundwater aquifer-stream system was specifically verified for the Batsto and the Oswego sub-basins by comparing the computed and historical return flow to the streams.

OBSERVATION RECORDS OF GROUND WATER LEVEL, (IN JAPANESE),
Geological Survey of Japan, Kawasaki.
T. Ozaki.
Geol Surv Jpn Rep. 249, p 1-54, 1973.

Descriptors: *Groundwater, *Data collection, Water levels, *Water supply, *Pumping, Industrial water, *Water level fluctuations, Artesian wells, Precipitation(Atmospheric).
Identifiers: *Japan.

Records of ground water levels in Japan are presented, and comments are given on the relation between annual fluctuation of ground water level and parameters such as history of development of ground water supply and the annual increase of pumping for industrial activities. A number of types of long-term fluctuations are distinguished. The fluctuation of ground water level is related to natural precipitation and supply from river water to the ground water basin. Ground water levels were found to be gradually lowering due to increased pumping from artesian wells in some areas. When pumping activities were controlled the ground water level was found to rise. Overall ground water levels were found to be slightly lower, suggesting that the problem will increase in the future.--Copyright 1975, Biological Abstracts, Inc.

A 'ROUGH CUT' MODEL OF A SOUTH FLORIDA WATER SUPPLY PLAN,
Central and Southern Florida Flood Control District, West Palm Beach.
W. V. Storch.
In Depth Report, Vol 1, No 9, p 1-12, December-January 1973. 3 fig.

Descriptors: *Florida, *Groundwater, *Aquifers, *Groundwater resources, *Water resources, Water table, Water table aquifers, Drought, Water storage, Groundwater movement, Groundwater potential, Groundwater availability, Subsurface waters, Surface waters.

South Florida water plans of the past and present are compared in this study of what a model plan should contain. The Corps of Engineers federal water supply plan of 1968, which sought long-term carryover storage facilities in and around Lake Okeechobee, is explained in detail. For the future, the study recommends greater withdrawal from the Biscayne aquifer, as well as backpumping from the lower east coast into the conservation areas. Storm runoff from the east coast should be directed deep underground. A series of studies examine the feasibility of matching water needs with population growth and environmental factors. The key recommendation is that the storage capability of Lake Okeechobee be raised to 17.5 feet, so as to match the expected increase in the state's population. (Frank-Florida)

CHARACTER OF SEEPAGE OF PRECIPITATION TO THE WATER TABLE IN THE CENTRAL FOREST STEPPE,
Akademiya Nauk SSSR, Moscow. Institut Geografii.
A. M. Grin, S. I. Yevlakhina, and Yu. V. Kuk.
Soviet Hydrology, Selected Papers No 4, p 267-270, 1975. 4 fig, 2 tab, 6 ref. Translated from Izvestiya Akademii Nauk USSR, Seria Geograficheskaia, No 5, p 70-76, 1975.

Descriptors: *Seepage, *Water table, *Groundwater recharge, Infiltration, Leaching, Forests, Grasslands, Precipitation(Atmospheric), Soil water, Groundwater, Moisture content, Water levels, Wells, Foreign countries, Foreign research, Water wells, Zone of aeration, Soil water movement, Snowmelt, Melt water.
Identifiers: *USSR.

Groundwater recharge by precipitation is of great interest because of its practical significance and great scientific complexity. The nature of water seepage from the soil surface through the aeration zone and to aquifers is insufficiently known in many natural areas. Yet it is known that the solution of many theoretical and practical problems in hydrology and water management depends on how, at what time, and in what way the groundwaters are recharged by precipitation seeping from above. Study of the water regime of soils in the central forest-steppe has been initiated as early as the 1920's. It was found that the soil water reserves are replenished mainly during the snow melt period and partly in autumn. The largest increment in soil moisture occurs during snowmelt, especially when conditions are favorable for meltwater seepage. Such conditions are observed when the soil is frozen to a small depth and there is no ice crust and also when the melting of snow is slow and its water equivalent is high. In such periods, the soil is wetted to a maximum depth. However, even under the most favorable conditions, continuous wetting over an area rarely reaches a depth of 3-5 m, whereas the depth to the water table here is 10 m or more, as a rule. (Sims-ISWS)

ARTIFICIAL RECHARGE TO A FRESH-WATER-SENSITIVE BRACKISH-WATER SAND AQUIFER, NORFOLK, VIRGINIA,
Geological Survey, Reston, Va. Water Resources Div.
D. L. Brown, and W. D. Silvey.
Available from the Supt. of Documents, GPO, Washington, DC 20402, Price $1.70. Professional Paper 939, 1977. 53 p, 39 fig, 10 tab, 16 ref.

Descriptors: *Groundwater recharge, *Artificial recharge, *Injection wells, *Brackish water, *Aquifers, Water quality control, Water storage, Test wells, Aquifer characteristics.
Identifiers: *Norfolk(Va), Test drilling.

Fresh water was injected into a brackish-water sand for storage and retrieval. The initial injection rate of 400 gpm decreased to 70 gpm during test 3. The specific capacity of the well decreased also, from 15.4 to 0.93 gpm. Current-meter surveys indicated uniform reduction in hydraulic conductivity of all contributing zones in the aquifer. Hydraulic and chemical data indicate this was caused by dispersion of the interstitial clay upon introduction of the calcium bicarbonate water into the sodium chloride bearing sand aquifer. The clay dispersion also caused particulate rearrangement and clogging of well screen. A pre-flush of 0.2 N calcium chloride solution injected in front of the fresh water at the start of test 4 stabilized the clay. However, it did not reverse the particulate clogging that permanently reduced permeability and caused sanding during redevelopment. Clogging can be prevented by stabilization of the clay using commercially available trivalent aluminum compounds. Test 1 and test 2 showed that 85 percent of the water injected can be recovered, and the water meets U.S. Public Health Standards. Storage of fresh water in a brackish-water aquifer appears feasible provided proper control measures are used. (Woodard-USGS)

HYDROLOGIC RECONNAISSANCE OF THE GEOTHERMAL AREA NEAR KLAMATH FALLS, OREGON, WITH A SECTION ON PRELIMINARY INTERPRETATION OF GEOPHYSICAL DATA,
Geological Survey, Menlo Park, Calif. Water Resources Div.
E. A. Sammel, and D. L. Peterson.
Water-Resources Investigations 76-127 (open-file report), 1976. 137 p, 20 fig, 11 tab.

Descriptors: *Geothermal studies, *Oregon, *Aquifer characteristics, *Water chemistry, *Groundwater, Geochemistry, Geophysics, Heat flow, Hot springs, Basalts, Faults(Geologic).
Identifiers: *Klamath Falls area(Oreg).

Geothermal phenomena in the vicinity of Klamath Falls, Oregon, include hot springs, steam and water wells with temperatures exceeding 100 deg C, and several hundred warmwater wells with temperatures ranging from 20 deg C to 35 deg C. Hot water is confined to three relatively restricted areas located near major fault and fracture zones of the Basin and Range type. The water is produced mostly from Tertiary basalt and volcanic sediments. The hot waters contain less than 1000 mg/liter of dissolved solids and have compositions dominated by sodium and sulfate. Silica concentrations are less than 100 mg/liter, and the minimum estimated reservoir temperature based on silica content is 130 deg C. Cation ratios suggest that actual reservoir temperatures are not much greater than the estimated minimum. The temperature regime in the upper 500-600 meters of rock is dominated by convective transport, and gradients exceed 150 deg C per kilometer at places. Heat flow in the area, however, may be no more than 1.5 - 2 heat-flow units. In the absence of evidence for a shallow intrusive body of hot rock, the geothermal phenomena are attributed to deep circulation of meteoric water. The reservoir may be one of the largest hot-water geothermal systems in the United States. (Woodard-USGS)

REPORT ON PRELIMINARY DATA FOR MADISON LIMESTONE TEST WELL NO. 1, NE1/4SE1/4 SEC. 15, T. 57 N., R. 65 W., CROOK COUNTY, WYOMING,
Geological Survey, Lakewood, Colo. Water Resources Div.

R. K. Blankennagel, W. R. Miller, D. L. Brown, and E. M. Cushing.
Open-file report 77-164, February 1977. 97 p, 8 fig, 3 plates, 5 tab, 1 ref.

Descriptors: *Groundwater resources, *Test wells, *Aquifer characteristics, *Water quality, *Wyoming, Groundwater potential, Borehole geophysics, Stratigraphy, Hydrogeology, Chemical analysis, Regional analysis, Montana, North Dakota, South Dakota, Projections.
Identifiers: *Madison Limestone, *Core analyses.

This report provides the preliminary data for the Madison Limestone test well no. 1 in Crook County, Wyoming, including test-well history, geology of the test well, hydrologic testing, and geochemistry. The test well was drilled to a depth of 4,341 feet to determine the water-resource potential of the Madison Limestone and associated rocks to meet future water needs in a 188,000 sq mi region that includes the coal-rich area of the Northern Great Plains. Drilling and testing were designed to yield a maximum of stratigraphic, structural, geophysical, and hydrologic information. All significant water-bearing units contain relatively freshwater (less than 2,000 mg/liter dissolved solids). Three water-bearing units, which are now cased off, may be potential sources of ground water in the area of the test well. These are the Hulett Sandstone Member of the Sundance Formation, the Minnekahta Limestone, and the upper sandy part of the Minnelusa Formation. (Woodard-USGS)

GROUND-WATER HYDROLOGY OF BERKELEY COUNTY, WEST VIRGINIA,
Geological Survey, Morgantown, W. Va. Water Resources Div.
W. A. Hobba, Jr.
West Virginia Geological and Economic Survey, Morgantown, and the Berkeley County Court, 1976. 21 p, 1 plate, 5 ref.

Descriptors: *Hydrogeology, *Groundwater resources, *Water quality, *Surface-groundwater relationships, Hydrologic data, Water table, Water levels, Aquifer characteristics, Chemical analysis, *West Virginia, Potomac River.
Identifiers: *Berkeley County(W Va), Potomac River basin.

Berkeley County, W. Va., is largely underlain by limestone aquifers in which water levels may fluctuate annually as much as 32 feet. In order to prepare maps of the water table and ground-water quality that represent one instant in time, data were collected during a two-week period of dry weather in July and August 1973. The water levels in 350 wells and springs and the discharge of 24 streams were measured. Water-quality analysis showed that specific conductance ranged from 10 to 1400 micromhos. Carbonate hardness ranged from 3 to 700 mg/liter. Nitrate concentration ranged from 0 to 143 mg/liter and chloride concentrations ranged from 3 to 255 mg/liter. As much as 85 percent of streamflfow may be derived from ground water in parts of the county underlain by limestone aquifers. This discharge may be as much as 600,000 gallons per day per square mile. Fifteen wells and springs were sampled after a period of recharge in January 1974. Fecal coliform and fecal streptococci concentrations were as much as 600 and 355 colonies per 100 ml, respectively. Nitrate concentrations in these samples were as much as 10 times higher than the concentrations found in samples collected in July and August. (Woodard-USGS)

Available from Branch of Distribution, USGS, 1200 S.Eads St., Arlington, VA 22202, price $0.75. Water-Supply Paper 2037, 1977. 31 p, 16 fig, 11 tab, 36 ref.

Descriptors: *Lumbering, *Clear-cutting, *Environmental effects, *Sediment yield, *Streamflow, *Oregon, Small watersheds, Hydrologic data, Water yield, Flow rates, Sediment transport, Water temperature, Evaluation.
Identifiers: Hydrologic changes, Small coastal watersheds.

Effect of clearcut, cable logging on the hydrologic characteristics of a small coastal stream in Oregon indicate an average 181-percent increase in sediment yield over a 7-year postlogging period. Annual runoff and high-flow volumes increased 19 and 1.1 inches, respectively, after logging in the watershed. Clearcutting in small, spaced patches in another watershed resulted in some increase in water and sediment yields, but the increase was not statistically significant. Average monthly April-October maximum water temperatures increased significantly in the principal stream of both the clearcut and 'patch-cut' watersheds. Hydrologic characteristics of both streams generally appear to be returning to prelogging conditions (1973). (Woodard-USGS)

NETWORK CHARACTERISTICS IN SUBURBANIZING STREAMS,
Iowa Univ., Iowa City. Dept. of Geography.
W. L. Graf.
Water Resources Research, Vol. 13, No. 2, p 459-463, April 1977. 4 fig, 4 tab, 10 ref.

Descriptors: *Drainage, *Networks, *Urbanization, *Iowa, Drainage systems, Drainage effects, Watersheds(Basins), Hydrographs, Channels, Data processing, Analytical techniques, Streamflow, Flash floods, Runoff, Geomorphology, Cities, Hydrology.
Identifiers: *Suburban drainage.

Analysis of hydrologic, geomorphic, and suburbanization data from a small instrumented drainage basin near Iowa City, Iowa, indicated that channel networks are radically altered when

nburban development overtakes a drainage basin. hanges in channel networks are such that the net- ork becomes much more efficient in collecting ater quickly, so that lag time and kurtosis of orm hydrographs are altered to produce the miliar flash floods of urban areas. The data owed that network changes are closely as- ociated with lag time, and kurtosis of storm ydrographs and suggested that corrective mea- ures should be concentrated on the internal links f the network. Changes in characteristics of chan- el networks should be considered in addtion to hanges in areas of impervious surfaces when the ydrologic impact of suburbanization is assessed. Sims-ISWS)

dentifiers: *Peterborough(Ontario).

small basin in Peterborough, Ontario, was in- rumented to investigate the contrasts in runoff esponse between rural and suburbanized sections f the basin. Data were collected over three easons (summer, fall, and spring) to evaluate easonal variations in the rural-urban contrast. esults indicated that the effect of the urban evelopment is felt most strongly in the spring nder snowmelt conditions and least strongly in ie summer. Urban direct runoff volumes exceed ural volumes by factors of 1.2 for summer rain- torms, 2.3 for fall rainstorms, and 7.5 for spring nowmelt and rain-on-snow events. Urban peak ischarges exceed rural peaks for the same easons by factors of 4.5, 2.4, and 7.1. Direct ru- off-rainfall ratios (rainfall and snowmelt in the pring case) are consistent in the rural basin, being .05 for the summer, 0.07 for the fall, and 0.06 for ie spring. The corresponding ratios in the urban asin are 0.06, 0.16, and 0.76. It is believed that easonal variations in the rural-urban response atios are caused mainly by seasonal fluctuations i the extent of the runoff contributing area in the rban basin. (Sims-ISWS)

dentifiers: *USSR.

he Nizhnedevitsk Hydrologic Station is in the entral part of the Central Chernozem Region of ie European USSR. A combination of agricul- ural and silvicultural reclamation practices has een carried out systematically in the Central hernozem Region in the past 20-30 years. As a esult, the productivity of agricultural lands has in- creased. For example, the grain crop yield in the Nizhnedevitsk station area has increased from 11 to 30 centners/hectare. The increase was promoted by a change in the structure of crop rotations and tillage practices. The present level of agricultural and silvicultural reclamation practices, which led to a sharp increase in the productivity of agricultural lands, did not change the annual runoff of rivers in the central part of the Central Chernozem Region, but resulted in a redistribution of the volumes of surface and subsurface flow into rivers. Surface runoff decreased by a factor of nearly 2, while subsurface flow increased by the same value. The change occurred mainly as a result of the conversion of summer-autumn surface runoff to subsurface flow and also because of a slight reduction in the proportion of surface runoff in spring. In the last 10 years, subsurface flow accounted for 70-75% of the annual river runoff volume, i.e., river runoff became more regulated by the subsurface storage of the basins, which must have a beneficial effect on the utilization of river runoff. The water erosion of soils decreases with a reduction of summer-autumn floods. (Sims-ISWS)

FLOOD-PLAIN DELINEATION FOR DIFFICULT RUN BASIN, FAIRFAX COUNTY, VIRGINIA,
Geological Survey, Reston, Va. Water Resources Div.
P. L. Soule.
Open-file report 76-459, 1976. 184 p, 112 fig, 16 tab, 4 ref.

Descriptors: *Flood plains, *Boundaries(Surfaces), *Urbanization, *Flood control, *Flood profiles, Maps, Flood frequency, Flood recurrence interval, Land management, Planning, Construction.
Identifiers: *Fairfax County(Va), Difficult Run basin.

Water-surface profiles of the 25-year and 100-year floods and maps on which the 25-, 50-, and 100-year flood boundaries are delineated for streams in the Difficult Run basin in Fairfax County, Virginia. The techniques used in the computation of the flood profiles and delineation of flood boundaries are presented. Difficult Run heads at about 500 ft. elevation near the city of Fairfax and discharges into the Potomac River at about 70 feet above mean sea level. Stream channel slopes are fairly steep, the main channel of Difficult Run has an average fall of about 25 feet per mile. Stream channels are well defined with established flood plains covered in most cases with trees and dense brush. Development within the basin has been gradual and mostly residential. In 1965 most of the development was in the area of Fairfax City and the town of Vienna and imperviousness for the basin at that time was computed to be less than 1 percent. Since 1965 considerable additional residential development has taken place within the basin in the Vienna and Reston areas and ultimate development with an overall imperviousness of 30 percent is anticipated with higher percentages of imperviousness near centers of anticipated development. THE HYDROLOGY OF A SMALL CATCHMENT BASIN AT SAMARU, NIGERIA: IV: ASSESSMENT OF SOIL EROSION UNDER VARIED LAND MANAGEMENT AND VEGETATION COVER;
Institute for Agricultural Research, Zaria (Nigeria).
J. Kowal.
Samaru Res Bull. 149, p 134-147, 1972.

Descriptors: *Soil erosion, *Land management, *Watershed management, *Surface runoff, *Runoff, Watersheds(Basins), Vegetation effects, Abrasion, Dispersion, Cultivation, Cultivated lands, Terracing.
Identifiers: Nigeria, Samaru, Plant nutrient loss, Nutrient loss.

The results of a field experiment designed to measure surface erosion under various systems of land management and vegetation cover are presented for the period 1965-8. No correlation was found between the amount of annual run-off and the amount of annual soil erosion or plant nutrient loss. This is attributed to a difference in the hydraulic characteristics of run-off flow, to a differential contribution to total erosion by splash and abrasion and to differences in the degree of dispersion brought about by various treatments tested. The average amount of soil lost in erosion from cultivated plots, 200 yards long and laid out at constant gradient of 1:320, ranged from 3.370 + 360 lb to 18,690 + or - 630 lb/acre (3,780 + or - 400 to 20,950 + or - 700 kg ha-1)/yr. Under natural vegetation no loss of soil occurred. The lowest erosion occurred from non-ridged land, averaging between 3,370 + 360 and 3,600 + 380 lb/acre (3,780 + or - 400 and 4,000 + or - 420 kg ha-1)/yr irrespective of treatment cover. Terraces with 3-ft (0.9-m) ridges gave 5.3 times as much soil loss than flat land, while that with alternate ridges tied was 1.5 times greater. The largest soil loss occurred from broadlands with alternately-tied ridges amounting to 1890 + or - 630 lb/acre (20,960 + or - 700 kg ha-1)/yr. The total amount of exchangeable and soluble bases lost annually in run-off and eroded soil range from about 14 + or - 1.9 lb/acre (15.7 + or - 2.1 kg ha-1)/yr on cropped flat land and alternately-tied ridges to 29.7 + or - 3.2 lb and 26.3 + or - 2.5 lb/acre (33.3 + or - 3.6 and 29.5 + or - 2.8 kg ha-1) on ridged land and broadlands with alternately-tied ridges, respectively. Annual loss of N ranged from about 7--19 lb/acre (7.8-21.3 kg ha-1) and was approximately proportional to the bases lost in each treatment. Under climate and soil conditions at Samaru growing crops on ridges along terraces still allows a significant amount of soil erosion and nutrient loss. Cultivation on flat terraced land is less damaging.--Copyright 1974, Biological Abstracts, Inc.

TRAP-EFFICIENCY INVESTIGATION BERNALILLO FLOODWATER RETARDING RESERVOIR NO. 1 (PIEDRA LISA ARROYO) NEAR BERNALILLO, NEW MEXICO, WATER YEARS 1956-1974,
Geological Survey, Albuquerque, N. Mex. Water Resources Div.
D. E. Funderburg.
Open-file report 77-261, March 1977. 43 p, 23 fig, 4 tab, 7 ref.

Descriptors: *Sediment control, *Reservoirs, *Trap efficiency, *New Mexico, *Thunderstorms, Runoff, Inflow, Retention, Outflow, Sediment

yield, Flash floods, Storm structure, Flood control.
Identifiers: *Bernalillo area(N Mex).

The U.S. Geological Survey, in cooperation with the U.S. Soil Conservation Service, began an investigation of sedimentation of Bernalillo Floodwater Retarding Reservoir No. 1 (Piedra Lisa Arroyo) near Bernalillo, New Mexico in 1956. This investigation was part of a nationwide investigation of the trap efficiency of detention reservoirs. Reservoirs No. 1 is normally a dry reservoir and runoff from the 10.6 sq km drainage area generally occurs from high-intensity summer thundershowers. The mesa area of the drainage basin was treated to prevent erosion and gullying and to retard rapid runoff of rainfall. The land treatment consisted of pits, terraces, seeding, and restricted grazing. The total outflow recorded for the period of record (July 19, 1956 to June 30, 1974) was 133 acre-feet, yielding 1,439 tons of sediment. Over 99 percent of the coarse sediments and a high percentage of the silts and clays were deposited in the reservoir before reaching the outflow pipe. The determined trap efficiency of Reservoir No. 1 was 96 percent for the period of record. (Woordard-USGS)

DESIGN EFFICIENCY OF STORMWATER DETENTION BASINS,
National Weather Service, Silver Spring, Md., Hydrologic Research Lab.
D. C. Curtis, and R. H. McCuen.
Journal of the Water Resources Planning and Management Division, American Society of Civil Engineers, Vol. 103, No. WR1, Proceedings Paper 12938, p 125-140, May 1977. 5 fig, 6 tab, 15 ref, 1 append.

Descriptors: *Urban runoff, *Detention reservoirs, *Model studies, Mathematical models, Erosion, Sedimentation, Sediments, Particle size, Sediment control, Runoff, Storm runoff, Flood routing, Water management(Applied), Urban drainage, Urbanization, Hydrology.
Identifiers: *Detention basins.

In addition to increased flood runoff, urban development has caused a significant increase in sediment loads in streams. While many means of sediment and runoff control have been proposed, stormwater detention has been shown to be one of the more cost efficient means. Because detention has been shown to be one of the more cost efficient means. Because detention facilities have not been used extensively in the past, a data base is not available for determining the effect of design factors on sediment trap efficiency and runoff control characteristics. A mathematical model, which includes erosion, sedimentation, and detention facility components, was developed from principles of hydraulics and classical settling mechanic. The model was used to examine the effecrt of : (1) detention basin location; (2) soil particle size distribution; (3) basin depth; (4) initial storage, and (5) orifice diameter. An understanding of the relative importance of these factors may lead to better design of stormwater detention facilities. (Sims-ISWS)

PERFORMANCE CHARACTERISTICS OF A GRASSED-WATERWAY TRANSITION,
Agricultural Research Service, Stillwater, Okla. Water Conservation Structures Lab.
W. O. Ree.
ARS-S-158, February 1977. 11 p, 14 fig, 3 tab, 1 ref.

Descriptors: *Channel flow, *Erosion control, *Grassed waterways, *Transition flow, Hydraulic jump, Flow, Equations, Profiles, Vegetation, Vegetation effects.
Identifiers: *Bermuda grass.

The report described the performance of a channel transition at the end of a grassed waterway during 11 test flows ranging from 0.83 to 145 cu ft/s to determine the ability of the transition to reduce velocity from supercritical to subcritical without erosion. The transition performed satisfactorily and suffered no erosion or cover loss from the flows. The good performance was attributed to a design that incorporates a gradual convergence of the conjugate depths, thus limiting hydraulic jump to a nondestructive minimum. Maintaining a dense, uniform bermudagrass cover also contributed to the success of the transition. (Bhowmik-ISWS)

DESIGNING FOR SEDIMENT TRANSPORT,
Army Engineer District, Kansas City, Mo.
W. M. Linder.
Water Spectrum, Vol 8, No 1, p 36-43 (Spring-Summer 1976). 3 map, 10 photo.

Descriptors: *Sediment transport, *Design criteria, *Flood control, *Channel erosion, Sediment control, Streams, Rivers, Decision making, Meanders, Berms, Drawdown, Levees, Alluvial faus, Damage, Environmental effects, Equilibrium, Suspended loads, Slopes, Projects.

Stream channelization is frequently employed without consideration of sediment transport characteristics of the stream, or of the extent to which the stream's natural balance will be disturbed. In the past, many problems associated with flood control, drainage, and navigation have been solved by modification of the river channels without giving equal thought to the sediment being transported by the water flowing in those channels. This has led to errors in the planning and design of channel modification projects. In many instances the objectives of the projects have been adequately met, but in others there have been adverse effects. Many acres of fertile land have been lost as the streams widened and deepened. Bridges have been damaged or destroyed during major runoffs. Erosion and sedimentation damage are the critical adverse effects. Techniques should be employed which consider sediment transport characteristics and stream equilibrium. In this way, the reactions of a stream to manmade changes can be minimized. Some of the techniques that should be considered are: (1) composite channel designs; (2) extensive use of levees; (3) grade control structures. The ultimate cost resulting from adverse effects of traditional channel modification is greater than the cost of a design that recognizes the influence of sediment transport. (Martin-Florida)

BITUMINOID FORMATION IN THE MUD SEDIMENTS OF DOMESTIC SEWAGE, (IN RUSSIAN),
Akademiya Nauk SSSR, Moscow. Institut Biologii Vnutrennykh Vod.
V. E. Sinel'Nikov.
Gidrobiol Zh. 9(5), p 12-20, 1973.

Descriptors: *Pollutant identification, *Spectroscopy, Infrared radiation, *Bottom sediments, *Sewage, Domestic wastes, Organic compounds, Fats, Oil, Muds, Luminescence.
Identifiers: *Bituminoids.

By using IR-spectroscopy and studying the luminescent characteristics of substances isolated from the chloroform fraction of domestic sewage bottom sediments, a possible transformation of fats and oils into high molecular weight compounds (bituminoids) is shown. The content of chloroform-soluble substances in the mud was 10% of the whole organic substance determined from losses during calcination. Bituminoids constituted from 25-50% of the whole chloroform-soluble substance. The bituminoid content in the exprimental was 2-10% of the fat applied.--Copyright 1975, Biological Abstracts, Inc.

HIGH SPEED LIQUID CHROMATOGRAPHIC ANALYSIS OF COBALAMIN PRODUCTIVITY AND DISTRIBUTION IN ACTIVATED SEWAGE SLUDGE TREATMENT,
Clark Univ., Worcester, Mass.
R. A. Beck.
Available from University Microfilms, Inc., Ann Arbor, Mich., 48106. Order No. 77-6014. Ph.D. Thesis, 1976. 107 p.

Descriptors: *Pollutant identification, *Chromatography, *Activated sludge, Analysis, Filtration, Separation techniques, Analytical techniques, *Sludge treatment, *Waste water treatment, Chemical analysis.
Identifiers: Cobalamins, Benzyl alcohol extraction.

A high speed liquid chromatographic technique was developed for the determination of 1-10 micrograms of total extractable cobalamins from activated sludge. Cobalamins are extracted by benzyl alcohol; spectrophotometrically interfering substances are removed by combined gel filtration and chromatography; trace extracts are concentrated by lyophilization; and total extractable cobalamins are quantified by high speed liquid chromatography. The annual productivity of cobalamins was found to average 1,87-27.08 micrograms/gram of dry sludge weight. Increases of this substance paralled increased environmental temperatures and diminished dissolved oxygen levels. Cobalamin levels were found to be 9.75 micrograms/gram in secondary stage activated sludge, 3.79 micrograms/gram in primary sludge and 4.75 micrograms.gram in tertiary sludge. (Collins-FIRL)

dentifiers: *Toxic substances, *Hospital waste-ater reuse, Human health problems, Mammalian cell culture, Hydroquinone, 2 4-initrophenylhydrazine, 1 3-dinitrobenzene, Behavioral toxicology.

he objective of this contract is to develop an ssay system to determine th presence of toxic ubstances in drinking water produced from a irect hospital wastewater reuse system (MUST). A biologically-based test system was chosen because it was potentially a non-specific indicator of the presence of toxins and it is relevant to identification of human health problems. Mammalian cells are cultured in vitro in a growth medium that employs the water under investigation as the solvent. The effect of the drinking water sample on the cell culture is evaluated by comparing cell growth in the test media with growth in control medium made with distilled water as the solvent. The primary aim of this contract in the second year is validation of the toxicity assay through comparison of the response of the assay system to graduated concentrations of known compounds with animal toxicological responses to the same compounds. Hydroquinone, 2,4-dinitrophenylhydrazine, and 1,3-dinitrobenzene dose-response data for animals and mammalian cells are presented. Although emphasis in the animal studies has been on classical toxicological methods, a limited amount of behavioral toxicology has also been carried out. (Katz)

A PNEUMATIC DOSING APPARATUS FOR FLOW-THROUGH BIOASSAYS,
Lakehead Univ., Thunder Bay (Ontario). Dept. of Biology.
A. D. Smith, J. R. Butler, and G. W. Ozburn.
Water Research, Vol 11, p 347-349, 1977. 3 fig, 3 ref.

Descriptors: *Bioassays, *Methodology, *Equipment, *Laboratory equipment, *Toxins, *Design, *Lethal limit, Laboratory tests, Technology.
Identifiers: *Pneumatic dosing apparatus, *Flow-through systems.

A multichannel pneumatic injector, when used with an equal-volume dilutor, possesses several advantages over the mechanical approach to toxicant dosing. The system is reliable and highly versatile, capable of maintaining an unlimited range of toxicant levels in flow-through bioassays. Use of a single toxicant concentration eliminates the necessity of preparing several stock solutions. Automatic reloading of the injector syringes reduces maintenance. (Katz)

Descriptors: *Bioassay, *Testing, *Analytical techniques, *Forecasting, *Rainbow trout, *Toxicity, *Oxygen, *Lethal limit, *Respiration, *Toxicity, *Water quality, *Bioindicators, Laboratory tests, Fish physiology, Oxygen demand, Industrial wastes, Pulp wastes.
Identifiers: *Residual oxygen bioassay, Sodium pentachlorophenate, Kraft pulp mill bleach effluent, Chloralkali plant waste.

A rapid bioassay procedure is described which for the toxic effluents tested, is sensitive to concentration in the 96-h LC50 range. The procedure requires less than eight hours to complete and is based on the consumption of available oxygen by fish in sealed containers. The procedure is evaluated using sodium pentachlorophenate, 3 kraft pulp mill bleach plant effluents and a chloralkali plant waste. The threshold concentrations obtained from the rapid procedure were directly comparable to 96-h LC50 values obtained by standard methods. For replicate tests with sodium pentachlorophenate, no significant difference between means of data obtained by the two bioassay procedures could be demonstrated. (Katz)

Descriptors: *Defoliants, *Absorption, *Path of pollutants, *Fishkill, *Herbicides, *Catfish, *Pesticide residues, *Pollutant identification,

*Arsenicals(Pesticides), Toxicity, Pesticides, Water pollution, Agricultural chemicals, Arsenic compounds, Water pollution sources, Agriculture weed control, Public health, Arsenic compounds.
Identifiers: *Bioaccumulation, *Arsenic.

Careless aerial spraying of a cotton field for weed control and defoliation caused the contamination of an adjacent reservoir with the herbicide. Dead catfish, resulting from exposure to the herbicide were found to contain high levels of arsenic (5.09 ppm in fish muscle tissue) suggesting this to be the cause of death. Seven weeks after the exposure, catfish from the reservoir were found to contain 12.38 ppm arsenic in muscle tissue, indicating bioaccumulation of the substance by surviving fish. Water arsenic levels fell from 2.50 ppm to 1.91 ppm after seven weeks. (Katz)

Descriptors: *Bioassay, *Water pollution effects, FIsh physiology, Biochemistry, Laboratory tests, Rainbow trout, Salmon, Juvenile fish, *Industrial wastes, *Pulp wastes, *Pulp and paper industries, Methodology, Aquaria, Lethal limit.
Identifiers: *Coho salmon, *Blood sugar levels, *Glucose, *Pulpmill effluent, *Blood sugar bioassay, *Bleached kraft mill effluent, Glucose levels, Liver glycogen reserves.

The hyperglycemic stress response of fish was evaluated for use as a rapid test for assessing stressful levels of pulpmill effluents (BKME). Plasma glucose levels in juvenile coho salmon (Oncorhynchus kisutch) were elevated within 0.5 h following transfer from the holding tank to aquaria containing either fresh water or BKME, peaking at 3-6 h and returning to near-basal levels at 24 h. Acclimation of coho to aquaria for 24, 48, 72, or 96 h prior to addition of effluent resulted in marked increases in glucose levels attributable to BKME. Significant responses to effluent were found with exposures of 3-10 h, whereas levels were not increased with exposures of 2 h or less. Plasma glucose levels increased progressively with increasing effluent concentrations. Threshold effect (EC50) values varied from 0.04 to 0.16 of the 96-h LC50 values. The response to BKME treated previously by the activated sludge process or by foam separation was diminished or absent altogether. Juvenile rainbow trout (Salmo gairdneri) and coho displayed a hyperglycemic response with 4-, 6-, or 8-h exposure to an identical effluent concentration, although the magnitude of response of rainbow was less in each instance. THE USE OF ION EXCHANGE METHODS TO DETERMINE TRACE ELEMENTS IN NATURAL WATERS: IV. URANIUM, COBALT AND CADMIUM, (IN GERMAN),
Vienna Univ. (Austria). Analytisches Institut.
J. Korkisch, and L. Goedl.
Talanta. 21(10), p 1035-1046, 1974.

Descriptors: *Ion exchange, *Trace elements, *Surface waters, *Anion exchange, *Separation techniques, *Cobalt, *Cadmium, Spectrophotometry, Analytical techniques, Water chemistry, Resins, Fluorometry, *Pollutant identification.
Identifiers: Austria, *Uranium.

A method is described for separating and determining by spectrofluorimetric or spectrophotometric measurement, traces of U, Co and Cd at ppm levels in natural waters. The sample is acidified with HCl, filtered, and after addition of ascorbic acid and potassium thiocyanate, passed through a column of Dowex 1- x 8 anion-ex-change resin in the thiocyanate form. The 3 ions are concentrated on the resin as thiocyanate complexes, being at the same time separated from most of the other ions present in the sample. Elution with a tetrahydrofuran-methylglycol-HCl mixture removes other interfering ions, then 6M HCl strips the Co, 1M HCl the U, and 2M HNO3 the Cd. Data are presented for concentrations of U (0.01-5 ppm), Co(0.04-1.9 ppm) and Cd (0.04-0.06 ppm) in a large number of water sources in Austria. A COMPARISON OF METHODS OF HYDROCARBON ANALYSIS OF MARINE BIOTA,
Alaska Univ., College. Inst. of Marine Science.
R. L. Gritz, and D. G. Shaw.
Bulletin of Environmental Contamination and Toxicology, Vol. 17, No. 4, p. 408-415, April 1977. 4 tab., 8 ref.

Descriptors: *Methodology, *Analytical techniques, *Pollutant identification, *Chemical analysis, *Organic compounds, *Biota, Chromatography, Laboratory tests, Testing procedures, Marine life.
Identifiers: *Soxhlet extraction, *Saponification.

The efficiency of currently used methods of hydrocarbon analysis are compared. Butter calm (Saxidomus gigantea) was used for the analysis in its natural state and spiked with a mixture of aliphatic and aromatic hydrocarbons. The methods that were compared were Soxhlet Extraction followed by saponification and extraction by alkaline digestion (direct saponification). For the latter extraction procedure, the effectiveness of two and 24 hour reaction times was compared. Each of the extracts was subjected to column chromatography using fully activated and partially deactivated sorbents. The best test procedures was found to be 24 hour saponification and column chromatography on partially deactivated columns. Soxhlet extraction and direct two hour saponification failed to remove all of the esters. The partially deactivated column was preferred because it prevented the possibility of alkene isomerization. A CERTAIN MARINE CATENATE DINOFLAGELLATE TENTATIVELY APPLIED FOR DETECTING CARCINOGENS,
Kyushu Univ., Fukuoka (Japan). Lab. of Fisheries and Chemistry.
S. Ishio, J. C. Chen, and T. YAno.
Bulletin of the Japanese Society Scientific Fisheries Vol. 43, No. 3, p. 277-288, 1977 9 fig., 26 ref.

Descriptors: *Algae, Phytoplankton, *Marine algae, Marine plants, *Biochemistry, Bioassay, Laboratory tests, Methodology, *Algicides, Nutrients, Pathology, Public health, Bioindicators, Pollutant identification.
Identifiers: *Carcinogens, Marine catenate dinoflagellates, *Polykrikos, Carcinogen detector, *Gyrodinium.

A marine catenate dinoflagellate having been tentatively applied for detecting carcinogens has been regarded to be Polykrikos schwartzi Butschli. However, this species does not belong to the genus Polykrikos for reasons that is devoid of both syncytium cell structure and nematocysts, but possesses both chloroplasts and phagocytes. This dinoflagellate is now concluded to belong to the genus Gyrodinium from the theca having both blisters and cortical vesicles, plastids very similar to those of Gyrodinium cohnii and the girdle displacement of 0.23 clearly exceeding the upper limit of that of Gymnodinium. ELECTROCHEMICAL DETERMINATIONS OF TRACE QUANTITIES OF PHOSPHATE AND NITRATE,
Southern Illinois Univ., Carbondale. Dept. of Chemistry and Biochemistry.
Gary L. Lundquist.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-268 898, Price codes: A07 in paper copy, A01 in microfiche. PhD Thesis, July 1975. 112 p, 27 fig, 7 tab, 78 ref. OWRT A-041-ILL(4). 14-31-0001-3213.

Descriptors: *Phosphates, *Nitrates, Trace elements, *Electrodes, Electrochemistry, *Volumetric analysis, *Membranes, *Pollutant identification, Cation exchange, Analytical techniques.
Identifiers: *Electrochemistrical stripping.

A method for the determination of phosphate based upon the cathodic chronopotentiometric stripping of an electrochemically deposited cupric phosphate salt film from a copper electrode has been developed. The oxidation state of copper in the salt film was determined by constant current coulometry at a copper-coated platinum electrode. The relative solubilities of the HPO42- and H2PO4- salts were investigated by short-time scale cyclic chronopotentiometry at pH 6.0. Linear working curves over single orders-of-magnitude down to 20 ppb phosphate have been obtained. The cathodic stripping determination of phosphate at a mercury electrode was also evaluated. A method for the determination of trace quantities of nitrate was successfully developed. The determination is based upon the voltammetric reduction of nitrate in the presence of excess lanthanum at a stationary mercury drop electrode. Working curves are linear over two orders-of-magnitude with a detection limit of 60 ppb nitrate. When the method is used in conjunction with a small volume anion exchange membrane isolated cell, the detection limit is lowered to 6.2 ppb. The effect of contact time and volume of a 1.0 x 10-6M NO3- solution was also determined. The effect of sample ionic strength on the rate of transfer of NO3-

through the membrane was studied by adding various concentrations of KCl to the samples. (Cox-Illinois)

Exxon Research and Engineering Co., Linden, N. J. Governmental Research Lab.
J. W. Frankenfeld, and W. Schulz.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A015 883, Price codes: A10 in paper copy, A01 in microfiche. U.S. Coast Guard Research and Development Report No. CG-D-107-75, June 1974. 206 p, 107 fig, 23 tab, 37 ref, 5 append. DOT-CG-23035.

Descriptors: *Oil pollution, *Oil spills, *Water pollution sources, *Pollutant identification, Environmental effects, Analytical techniques, Chromatography.
Identifiers: *Outer Continental Shelf.

A study was undertaken to develop a rapid, efficient method for identifying the source of spilled oil. Fifty-seven different petroleum products were weathered under controlled conditions in laboratory simulators. Samples were taken periodically and examined by a variety of analytical techniques. The analytical methods were graded on their abilities to classify petroleum products as to generic type and to identify the actural source of the spilled oil. Four types of analyses were identified as being especially useful: thin-layer chromatography, infrared fingerprinting, gas chromatographic fingerprinting and liquid-liquid chromatography. The application of these techniques is discussed in detail and examples are given. By use of a combination of these four techniques all oils studied in this project could be uniquely identified. Descriptors: *Nitrogen compounds, *Argon, *Sediment-water interfaces, *Resources development, *Baseline studies, *Environmental effects, *Nitrification, *Denitrification, Geochemistry, *California.
Identifiers: *Outer Continental Shelf, Molecular nitrogen, Sulfate reduction, Interstitial water, Southern California.

The first quantitative observations of dissolved molecular nitrogen (N2) in deep-sea sedimentary pore waters show increases of up to 17% above adjacent bottom water values. The N2 : Ar concentration ratio similarly increases. This increase is greater than expected from reduction of seawater nitrate in the sediment. A mechanism is suggested in which ammonia, derived from nitrogen-containing organic matter is converted to N2 through a nitrite intermediate under conditions of low oxygen tension. Ammonia is not converted to N2 in anoxic sediments that are undergoing sulfate reduction even though N2 is the thermodynamically stable species. (Sinha-OEIS)

BENTHIC MACROINVERTEBRATES AS INDEXES OF WATER QUALITY IN THE SCIOTO RIVER BASIN, OHIO,
Akron University, Akron, Ohio, Department of Biology.
J. H. Olive, and K. R. Smith.
Available from the National Technical Information Service, Springfield, VA 22161, as PB-269 013, Price codes: A07 in paper copy, A01 in microfiche. Bulletin of the Ohio Biological Survey, New Series, Vol 5, No. 2, 1975. 124 p, 20 fig, 23 tab, 53 ref. OWRT B-008-OHIO(2).

Descriptors: *Benthos, *Invertebrates, *Bioindicators, *Ohio, Water quality, Water pollution, *Pollutant identification, Biological communities, Chlorides, Water temperature, Dissolved oxygen, Phosphates, Sulfates, Hardness(Water), Hydrogen ion concentration, *Organic wastes, Sediments.
Identifiers: *Scioto River basin(Ohio).

The results are presented of an evaluation of water quality in the Scioto River system based on the composition and structure of benthic macroinvertebrates communities. Benthic macroinvertebrates from natural substrates were analyzed at 76 locations on the main river channel and on major tributaries during 1967, 1968, and 1969. Water temperature and the concentration of total alkalinity, chloride, total hardness, dissolved oxygen, total inorganic phosphate, sulfate, and hydrogen ions (pH) were determined at each location. Inadequately treated and untreated organic wastes from municipal sewage treatment facilities and sediments from eroding soils were the most common pollutants in the Scioto River Basin. Benthic invertebrate communities were indicative of relatively high quality water at 26 locations; of moderately polluted water at 38 locations; and of heavily polluted water at 12 locations. In heavily polluted areas benthic invertebrate communities usually consisted of more than 80 percent organic pollution-tolerant organisms and had H' values less than 1.0. At least one high-quality area was observed on each stream investigated, usually in the headwater region. The most heavily polluted areas in the Scioto River basin were located below Marion on the Little Scioto River, throughout most of Little Walnut Creek, in mostsections of the Scioto River between Columbus and Portsmouth, and in the north Scioto River just below the mouth of the Little Scioto River.

Identifiers: Contaminants, *Chemical compounds, Geographical distribution, Computerized list, *Frequency of occurrence(Wastes).

This study was initiated for the purpose of compiling a list of all organic compounds that have been found in water. This report contains the names of compounds found, their location or a reference to a published study, the type of water in which they are found, and the date of sampling or report generation. About 5700 entries are in this list at present. Among them are 1259 different compounds that have been found in one or more of 33 different water types. Tables in the text include lists of the data file sorted by compound name, location or reference, and water type. Also included are tables that summarize the frequency of occurrence of each compound, location or reference, and water type. No attempt has been made to include data from studies that include only analysis for specific compounds. The list is meant to include, however, all survey-type analyses of water samples. (Katz)

Descriptors: *Methodology, Laboratory techniques, *Laboratory analysis, *Organic compounds, *Public health environmental control, *Pollutant identification, Fungicides, Bioassay, Organic wastes, *Fluorescence.
Identifiers: Polarization, *Immunoassay, *Organic contaminants, 2-aminobenzimidazole, *Benzimidazole, Fluorescein.

This report describes the development and successful demonstration of an immunological assay for the detection of low molecular weight organic contaminants of environmental concern. The specific technique described is a fluorescence polarization immunoassay, the theory of which is presented. The preparation of the two required reagents, namely a fluorescent conjugate of the contaminant of interest, together with an antibody to the contaminant, is described in detail. The specific contaminant chosen for this study was 2-aminobenzimidazole (MW = 133), a metabolite of certain fungicide agents used in agriculture. The particular fluorescent mostly chosen to form the conjugate with the 2-aminobenzimidazole was fluorescein. A successful demonstration of the assay has been accomplished, and a detection sensitivity in the sub-nanogram/ml range obtained. A high degree of specificity of the antibody for the hapten has been demonstrated, and a successful quantitative recovery from an unknown solution has been obtained. (Katz)

Descriptors: *Washington, *Idaho, Sediments, *Lakes, *Lake sediments, Carbon, Phosphorus, Manganese, Nitrogen, Pollutant identification, Water pollution.
Identifiers: Total organic carbon, Nitrate nitrogen, Silver Lake, Coeur d'Alene Lake, Liberty Lake, Williams Lake, Capital Lake.

Sediment cores were obtained from Coeur d'Alene, Liberty, Williams, Silver and Capital Lakes in the Washington-Idaho region. A procedure was developed to analyze the total organic carbon (TOC) of sediment using the Oceanographic International Corporation (OIC) carbon analyzer. Suitable computer techniques were employed to determine the non-linear standard curves and interpolation of TOC values. Experiments involving changes in reagent amounts, purging times, and oxidation times showed the newly developed procedure for determining TOC in sediment to be valid. Total phosphorus (T-P), manganese (Mn), and nitrate nitrogen (NO3-N) concentrations of these same sediments were analyzed and compared. No clear cut distribution patterns in chemical data were found among the lakes' sediments. Total organic carbon values were highest in Liberty Lake sediments. Total phosphorus, Mn, and NO3-N values were highest in Coeur d'Alene Lake sediments. In fact, TOC and T-P measurements in this investigation do not appear to be a precise indicator of a lake's tropic status. Manganese has been found to be a controlling factor in phosphorus sedimentation in other studies. However, this did not appear to be the case in this investigation.

ANALYSES OF NATIVE WATER, BED MATERIAL, AND ELUTRIATE SAMPLES OF MAJOR LOUISIANA WATER WATERWAYS, 1975,
Geological Survey, Baton Rouge, La. Water Resources Div.
C. R. Demas.
Open-file report 76-853, December 1976. 304 p, 15 plates, 15 tab, 6 ref.

Descriptors: *Environmental effects, *Dredging, *Navigable waters, *Louisiana, Sampling, Water analysis, Bottom sediments, Chemical analysis, Metals, Pesticides, Nutrients, Organic compounds, Evaluation, Path of pollutants.
Identifiers: *Elutriate.

The U.S. Geological Survey, in cooperation with the U.S. Army Corps of Engineers, conducted a series of elutriate studies in selected reaches of major navigable waterways of Louisiana. As defined by the U.S. Environmental Protection Agency, an elutriate is the supernatant resulting from the vigorous 30-minute shaking of one part bottom sediment from the dredging site with four parts water (vol/vol) collected from the dredging site followed by one hour settling time and appropriate centrifugation and a 0.45-micron filtration. The elutriate studies were initiated to evaluate possible environmental effects of proposed dredging activities in selected reaches of Louisiana waterways. The waterways investigated were the Mississippi River-Gulf Outlet, Breton Sound, Mississippi River downstream from Baton Rouge, Bayou Long, Intracoastal Waterway (east and west of the Harvey Canal), Three Rivers area, Ouachita River, Barataria Bay, Houma Navigation Canal, Atchafalaya Bay (Ship Channel), Berwick Bay, Intracoastal Waterway (Port Allen to Morgan City), Petite Anse area, and Calcasieu River and Ship Channel. The Geological Survey collected 227 samples of native water and bed (bottom) material from 130 different sites. These samples (as well as elutriates prepared from mixtures of native water and bed material) were analyzed for selected metal, pesticide, nutrient, and organic constituents. An additional 116 bed samples collected at 58 sites were analyzed for selected pesticides; and 4 additional native-water samples from 2 sites were analyzed for selected metal pesticide, nutrient, and organic constituents. vailable from the National Technical Informaon Service, Springfield, VA 22161 as PB-268 773, rice codes: A03 in paper copy, A01 in microfiche. echnical Report No 102, August 1976. 25 p, 7 fig, tab, 30 ref, 3 append. OWRT A-048-HI(1). 14-31-001-5011.

escriptors: *Nitrogen, Denitrification, Percolation, Effluents, *Hawaii, Waste disposal, oils, Path of pollutants, Water pollution sources. dentifiers: *Land disposal, Latosol, *Oxisol.

he objective was the investigation of the percote rate and the disposition of nitrogen from a aboratory soil column when chlorinated secondary sewage effluent was applied under both connuous and intermittent loading. A 1.7-m (5.5-in.) iameter column was packed to a depth of 1.5 m (5) with a well-aggregated Oxisol soil (Lahaina seies). A constant head was maintained by a odified Mariotte bottle during the application of ffluent. Percolate was sampled through ports at 7 epths as well as from a bottom drain. When effluent was continuously ponded on the surface: (1) ercolate rate decreased with time, (2) ammonium ons were adsorbed, (3) nitrification was supressed, (4) denitrification occurred, and (5) the enitrification biological community required nore than 2 days to develop. When effluent applcation was stopped after 2 days and aerobic condiions developed, nitrification was very active vithin 5 days. The solute breakthrough curve apeared well in advance of 1 pore volume and was ighly skewed with an extended tail.

HYDROLOGY OF THREE RECREATIONAL LAKES IN EASTERN WASHINGTON STATE,
Washington State Univ., Pullman. Dept. of Civil nd Environmental Engineering.
H. D. Copp.
Available from the National Technical Informaion Service, Springfield, VA 22161 as PB-268 799, Price codes: A03 in paper copy, A01 in microfiche. Progress Report, July 1, 1975. 22 p, 10 fig, 8 tab. OWRT A-067-WASH(1). 14-31-0001-5048.

Descriptors: *Evaporation, Nutrients, *Water balance, Eutrophication, Hydrology, *Lakes, *Washington, Recreation, *Water pollution sources, Lake basins, Watersheds(Basins).
Identifiers: *Non-point source pollution, *Newman Lake Basin(Wash), *Liberty Lake Basin(Wash), *Williams Lake Basin(Wash).

Data were collected over a complete water year (October 1 to September 30). The objective was to assess the water resources of three rather small, freshwater lake basins in eastern Washington State. Each lake provides a source of water-oriented recreation, particularly during the summer season. Land occupation consists of forest cover, range lands, ranching, and resident living. Most of the latter occurs as summer homes on and near the lake shores. Most of the occupation generates water-borne waste which could find its way into the lakes either directly or via surface and subsurface streamflow. Assessment of the water resources may lead to the identification of water pollution sources. (McHenzie-Wash State)

CARBON ISOTOPIC STUDY OF THE FATE OF LANDFILL LEACHATE IN GROUNDWATER,
Indiana Univ., Bloomington. Dept. of Chemistry.
L. M. Games, and J. M. Hayes.
Journal Water Pollution Control Federation, Vol. 49, No. 4, p 668-677, April, 1977. 7 fig, 6 tab, 22 ref.

Descriptors: *Water pollution sources, *Carbon, *Landfills, Municipal wastes, Waste disposal, Groundwater movement, Organic compounds, Leachate, Inorganic compounds, Water analysis, Path of pollutants, Indiana, *Isotope studies.
Identifiers: Isotope ratio measurements, Columbus(Ind).

Carbon is present in ground water in various forms and amounts, and sanitary landfills represent an important unnatural input of carbon to nearby aquifers. Little is known, however, about the movement of carbon in ground water or the extent of its interactions of a biological or physical nature over time. In this study, comparisons of carbon isotope ratios were used to analyze ground water entering the Columbus, Indiana landfill site, the landfill leachate, and ground water leaving the landfill area. Water taken from six wells was analyzed for concentrations of volatile organic carbon, nonvolatile organic carbon, and inorganic carbon. The findings emphasized the need to study more than one type of carbon compound when assessing the chemical effects of unnatural carbon inputs, and that a long period of observation is necessary to fully picture reactions taking place between natural and contaminant ground water carbon. It was concluded that the Columbus landfill did not significantly affect the bulk carbon content of the underlying aquifer, although contamination by trace amounts of highly toxic materials is still a theoretical possibility. The isotopic investigation method in and of itself was judged very useful for this and similar studies. (Eberle-NWWA)

THERMAL AND CHEMICAL PROBLEMS OF THERMAL WATERS, (LES PROBLEMES THERMIQUES ET CHIMIQUES DES EAUX THERMALES),
Bordeaux Univ., Talence (France). Centre d'Hydrogeologie.
H. J. Schoeller.
In: Thermal and Chemical Problems of Thermal Waters, Proceedings of the Grenoble Symposium, August/September, 1975. p 1-5, 5 ref.

Descriptors: *Reviews, *Thermal pollution, Heated water, Chemistry, Temperature, Research and development, Thermal water, Water pollution, Water chemistry.

This paper presents an overview of the existing problems of thermal waters. Aspects considered include the source of temperature and chemical composition; geological factors; status of present knowledge and methods of research. (See also W77-08677) (Chilton-ORNL)
W77-08678

SOME FEATURES OF THE GEOCHEMISTRY OF THERMAL WATER IN PLATFORM AREAS FROM EXPERIMENTAL DATA,
Akademiya Nauk SSSR, Moscow. Institut Vodnykh Problem.
I. G. Kissin, and S. I. Pakhomov.
In: Thermal and Chemical Problems of Thermal Waters, Proceedings of the Grenoble Symposium, August/September, 1975. p 7-15, 3 fig, 1 tab, 4 ref.

Descriptors: *Geochemistry, Hydrology, *Thermal pollution, Heated water, Sea water, Temperature, Chemical activity, Thermodynamics, *Thermal water, Water pollution.

Rocks classified as clayey, sandy, carbonate and cristalline were leached with distilled water, sea water, sodium and calcium NaCl solutions at temperatures ranging from 20-250C. At high temperatures, data showed a decrease in pH values and potassium content and an increase in silic-acid and boric-acid contents. Calcium sulfate and carbonate content and the composition of rocks affected temperature metamorphization of water with gypsum bearing rocks causing sharpest variations. At high temperatures, metamorphization of sea water in contact with carbonate rocks resulted in a sharp decrease in sulfate and Mg ion concentration. Free CO2, liberated by hydrolysis, caused an increase in chemical activity of thermal water. (See also W77-08677) (Chilton-ORNL)

THE HELIUM ISOTOPES IN THERMAL FLUIDS,
Akademiya Nauk SSR, Moscow. Geologicheskii Institut.
B. G. Polak, V. I. Kononov, I. N. Tolstikhin, B. Mamyrin, and L. V. Khabarin.
In: Thermal and Chemical Problems of Thermal Waters, Proceedings of the Grenoble Symposium, August/September, 1975. p 17-33, 5 fig, 3 tab, 12 ref.

Descriptors: *Geochemistry, Hydrology, Heated water, *Helium, *Isotope studies, *Thermal water, Tracers.

The study compares the isotopic composition of helium from thermal fluids discharged in tectonically mobile belts of the earth where there are favorable conditions for the outflow of abyssal matter and energy from the interior onto the earth's surface. It was concluded that there is no direct connection between He3/He4 values and the general gas composition of thermal fluids. It appeared that helium with the mantle isotopic composition and the main components of hydrothermae gas are formed at different levels, helium being supplied from the deepest interiors. SOME GEOCHEMICAL PROBLEMS IN THE UTILIZATION OF GEOTHERMAL WATERS,
Department of Scientific and Industrial Research, Wellington (New Zealand). Chemistry Div.
A. J. Ellis.
In: Thermal and Chemical Problems of Thermal Waters, Proceedings of the Grenoble Symposium August/September, 1975. p 100-109, 5 tab, 2 fig, 15 ref.

Descriptors: *Geothermal studies, Environmental effects, Salinity, *Heated water, Temperature, Silica, Chemistry, Water utilization, Thermal water, Reviews.

Recent research on the disposal of geothermal waters is reviewed. The environmental effects of geothermal discharges as they relate to vegetation damage or contamination of local waterways is emphasizes. The particular problems encountered by the chemistry of silica in solution, its polymerization and precipitation processes are discussed, including the development of a pilot-scale process to remove silica from geothermal waters. RESULTS OF A MICROBIOLOGICAL INVESTIGATION OF THE DANUBE RIVER BY ONE POINT PROFILE (1969-1971), (IN GERMAN),
I. Daubner, and B. Trzilova.
Biologia (Bratisl). 28(9), p 775-781, 1973.

Descriptors: *Rivers, *Aquatic bacteria, *E coli, *Aquatic microorganisms, *Water pollution sources, Microorganisms, Plankton, River flow, Sugar crops, Organic wastes.
Identifiers: *Austria, *Czechoslovakia, *Danube River, Heterotrophic bacteria, Fecal pollution.

In comparison with previous years, no substantial changes were noticed either in the number or in the dynamics of microbical plankton taken as a whole or in the individual components. The number of bacteria is inversely proportional to the flow/s, which points to the mountainous character of the river (diluted pollution). The increase in the number of heterotrophic bacteria is considerably influenced by the sugar-production season in Austria and Moravia (Czechoslovakia) (Sept.-Dec.), but the microbial plankton, taken as a whole, is not affected. During the whole period of investigation (1961-1971) there was a gradual decrease of Escherichia coli (principal fecal pollution indicator species) from 46.5% to 29.7%; atypical strains gradually increased in the same period from 4.6% to 38.2%. This phenomenon probably reflects the increased pollution, particularly with specific toxic substances.--Copyright 1974, Biological Abstracts, Inc.

THE EFFECT OF SOIL MOISTURE ON THE DEVELOPMENT OF SOIL MICROFLORA IN CONDITIONS OF FIELD EXPERIMENTS, (IN SLOVAK),
Vyskumny Ustav Rastlinnej Vyroby, Piestany (Czechoslovakia).
L. Haban.
Ved Pr Vysk Ustavu Rastlinne J Vyroby Pi-estanoch. 11, p 27-34, 1973.

Descriptors: *Soil moisture, *Soil microorganisms, *Soil bacteria, Topsoil, Loam, Clay loam, Cultures.
Identifiers: Ammonifying bacteria, Amylolytic bacteria, Cellulose-decomposing, Bacteria, Pectinolytic bacteria, Amino acid-decomposing bacteria, Correlations, Czernosem.

Correlations between the soil moisture and the development of 6 cultured groups of microorganisms were investigated in field trial using different methods of increasing of topsoil on a degraded czernosem and loamy to clayey soils. A high significant correlation dependence was found between the number of bacteria and the soil moisture. A higher correlation dependence between the development of the cultured groups and the soil moisture was found, except for the cellulose decomposing bacteria, in the subsoil layer. The response of the individual cultured groups of bacteria varied with soil moisture conditions. Most susceptible were the cellulose decomposing microorganisms, pectinolytic bacteria and amino acid decomposing bacteria. Less susceptible were protein decomposing (ammonifying) bacteria and amylolytic bacteria. The correlation between humin matter decomposing bacteria and the soil moisture was insignificant.--Copyright 1974, Biological Abstracts, Inc.

THE BEHAVIOUR OF DISSOLVED IRON, MANGANESE AND ZINC IN THE BEAULIEU ESTUARY, S. ENGLAND,
University of East Anglia, Norwich (England). School of Environmental Sciences.
L. M. Holliday, and P. S. Liss.
Estuarine and Coastal Marine Science, Vol. 4, 1976, p 349-353, 3 fig, 10 ref.

Descriptors: Chemistry, Sea water, *Salinity, *Iron, *Manganese, *Zinc, Hydrogen ion concentration, Estuaries, *Dissolved solids, Water pollution sources.
Identifiers: Beaulieu Estuary(England).

The relationship between salinity and the concentration of dissolved iron, manganese, and zinc are reported. Rapid removal of iron as salinity increased was apparent. This removal is almost complete by the time the salinity of the estuarine water has reached 15%. A possible hypothesis to explain the removal mechanism is homogeneous precipitation of hydrous iron oxides formed as a result of change in pH associated with the mixing process. In contrast to the large scale removal observed for iron, any deviation from conservative behaviour for manganese and zinc were either small or non-existent. (Chilton-ORNL)
W77-08701

THE DISTRIBUTION OF TRACE METALS IN THE WESTERN NORTH ATLANTIC OFF NOVA SCOTIA,
Bedford Inst. of Oceanography, Dartmouth (Nova Scotia). Atlantic Oceanographic Lab.
J. M. Bewers, B. Sundry, and P. A. Yeats.
Geochimica et Cosmochimica Acta, Vol. 40, No. 6, 1976, p 687-696, 9 fig, 5 tab, 26 ref.

Descriptors: *Water pollution sources, Pollutants, *Trace elements, Manganese, Iron, *North Atlantic, Sediments, Runoff, *Path of pollutants, *Distribution, *Canada, Metals.
Identifiers: Trace metals.

Significant differences between water mass trace element concentrations were found with the most striking feature of the distributions being that, with the exception of manganese, the Atlantic Slope water contained lower trace metal concentrations than the underlying Central Atlantic water. Concentrations of Fe and Mn extracted from suspended matter on the Scotian Shelf were higher than those in the non-detrital fraction of the underlying sediments. Mn showed major nearshore increases in concentration related to continental runoff but Fe concentrations are controlled by particulate matter distribution. For other trace elements, the effects of both continental runoff and anthropogenic activity appeared to be minor even a few miles from the coast. (Chilton-ORNL)

TRANSPORT OF MOLYBDENUM IN MOUNTAINOUS STREAMS, COLORADO,
Colorado Univ., Boulder. Dept. of Geological Sciences.
D. S. Kaback.
Geochimica et Cosmochimica Acta, Vol. 40, 1976, p 581-582, 2 tab, 1 ref.

Descriptors: *Water pollution effects, *Water pollution sources, Mine wastes, Metals, *Molybdenum, Streams, *Colorado, *Path of pollutants.

The study investigated the transport of Mo in river sediments and waters of Colorado with the principal area of interest being in the drainage below a large mining and milling operation. In most cases the molybdenum carried in water was largely in true solution but at certain times of the year the suspended load in samples taken near the mill showed 300-325 ppm (19% of the total load in the water at that time). (Chilton-ORNL)
W77-08705

AN ECOLOGICAL MODEL FOR HEAVY METAL CONTAMINATION OF CROPS AND GROUND WATER,
Royal Danish School of Pharmacy, Copenhagen.
S. E. Jorgensen.
Ecological Modelling, Vol. 2, 1976, p 59-67, 2 fig, 5 tab, 6 ref.

Descriptors: *Model studies, Ecology, Sludge, *Soil contamination, Pollutants, *Lead, *Groundwater, Crops, *Heavy metals, *Path of pollutants, Water pollution sources.

The model reported is able to predict the concentration of heavy metals in ground water and crops when sludge is added to the soil. Model prediction indicates that Pb is limiting the use of sludge as a soil conditioner and that crop contamination appears to be a greater danger than ground water contamination. It is indicated that municipal sludge can be used in considerable quantities without danger if soil has a high humus or clay content and the pH is maintained close to 7.00. It was concluded that, while the model has given acceptably good results, the number of case studies are limited and that the model should therefore be used cautiously. (Chilton-ORNL)

Geological Survey, Lakewood, Colo. Water Resources Div.
M. C. Goldberg.
The Science of the Total Environment, Vol 5, p 277-294, 1976: Elsevier Scientific Publishing Company, Amsterdam, Netherlands, 1976. 11 fig, 2 tab, 17 ref.

Descriptors: *Organic pesticides, *Aqueous solutions, *Bottom sediments, *Chlorinated hydrocarbon pesticides, *Herbicides, Sampling, Chemical analysis, Analytical techniques, Water pollution, Agricultural chemicals.
Identifiers: *Total organic concentrations.

The origin of small organic molecules in surface waters of the United States, for the most part, stems from industrial, urban and agricultural sources. Agricultural materials were examined, particularly the chlorinated pesticides and herbicides, to determine concentration ranges within which the characteristic interactions of these solutes could be defined. Chlorinated hydrocarbon concentrations of bottom sediments at selected locations ranged from 5 ng/kg (nanograms per kilograms) to 3.5 micrograms per kilograms, and in water from 5 ng/liter to 0.06 micrograms per liter. Herbicide concentrations in water ranged from 5 ng/liter to 1.5 micrograms per liter for the same samples. Total organic carbon concentrations at these locations ranged from less than 0.1 to 42 milligrams per liter. (Woodard-USGS)

Descriptors: Bacteria, Biochemistry, *Biodegradation, *Oil, *Oil spills, Oily water, Laboratory tests, *Phenols, Enzymes, Hydrogen ion concentration, Organic compounds, *Aromatic compounds, Physiology, *Oil wastes, *Oil pollution, *Microbial degradation.
Identifiers: *Ortho-xylene, *Nocardia, Enzymatic fission, Hydrolytic reaction, *Chlorobiphenyl, *Monochlorinated biphenyl isomers.

The biodegradation of ortho-xylene by a species of Nocardia is initiated by nuclear oxidation to form 3,4-dimethylcatechol. The latter compound is apparently formed from cis-3,4-dimethyl-3,5-cyclohexadien-1,2-diol (cis-o-xylene dihydrodiol). Enzymatic fission of 3,4-dimethylcatechol produces an acid, 2-hydroxy-5-methyl-6-oxohepta-2,4-dienoic acid, that undergoes spectral changes at acid and alkaline pH. Further metabolism of the ring-fission product occurs by a hydrolytic reaction that forms acetic and 2-oxohex-4-enoic acids. Enzymatic hydration of the latter compound to give 4-hydroxy-2-oxohexanoate is followed by an aldolase reaction that produces pyruvate and propionaldehyde. The pathway proposed for the biodegradation of o-xylene is analogous to those reported for the degradation of a number of aromatic compounds. Commercial samples of 2-, 3-, and 4-chlorobiphenyl contain impurities that cause lag periods in the growth of Beijerinckia on succinate. Purified preparations of these compounds also inhibited the initiation of growth of this organism but not to the same extent. Preliminary observations suggest that inhibition may be associated with the ease of oxidation of the monochlorinated biphenyl isomers. (Katz)

SIMULATION OF POLLUTANT MOVEMENT IN GROUNDWATER AQUIFERS,
Texas A and M Univ., College Station. Dept. of Agricultural Engineering.
R. Khaleel, and D. L. Reddell.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-268 835, Price codes: A12 in paper copy, A01 in microfiche. Texas Water Resources Institute, College Station, Technical Report No 81, September 1976. 248 p, 47 fig, 87 ref, 6 append. OWRT A-030-TEX(1). 14-31-0001-5044, 14-31-0001-6045.

Descriptors: Groundwater, *Groundwater movement, *Dispersion, *FLow, *Aquifers, *Path of pollutants, *Simulation analysis, *Model studies, Infiltration, Porous media, Equations.
Identifiers: Computer simulators, Numerical simulators.

A three-dimensional model describing the two-phase (air-water) fluid flow equations in an integrated saturated-unsaturated porous medium was developed. Also, a three-dimensional convective-dispersion equation describing the movement of a conservative, noninteracting tracer in a nonhomogeneous, anisotropic porous medium was developed. Finite difference forms of these two equations were solved using an implicit scheme to solve for water or air pressures, an explicit scheme to solve for water and air saturations, and the method of characteristics with a numerical tensor transofmration to solve the convective-dispersion equations. The inclusion of air as a second fluid phase caused the infiltration rate to decrease rapidly to a value well below the saturated hydraulic conductivity when the air became compressed. This is in contrast to one-phase fluid flow problems in which the saturated hydraulic conductivity is considered to be the lower bound for the infiltration rate. A typical two-dimensional drainage problem in agriculture was solved in a nonhomogeneous, integrated saturated-unsaturated medium using the total simulator of fluid flow and convective-dispersion equations. A variety of outputs, such as an equipotential map or a solute concentration map, were obtained at selected time steps. A field-size problem describing the migration of septic-tank wastes around the perimeter of a lake was also considered and solved using the total simulator. The unique features of this model are (1) infiltration was treated as a two-phase fluid (air-water) flow process, (2) the complete subsurface regime (saturated and unsaturated) was considered as a unified whole, (3) the nonhomogeneous nature of a porous media and a variety of realistic boundary conditions are considered and (4) the tensorial nature of the dispersion coefficients was recognized.

PRODUCTION AND HEAVY METAL CONCENTRATION OF VASCULAR AQUATIC MACROPHYTES IN THREE EASTERN CONNECTITUCT RIVERS,
Connecticut Univ., Storrs.

R. M. Heisey.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-268 834, Price codes: A06 in paper copy, A01 in microfiche. Master of Science Thesis, 1975. 97 p, 11 fig, 20 tab, 124 ref. append. OWRT A-502-CONN(9), 4-31-0001-3507.

Descriptors: *Water pollution sources, Water pollution treatment, *Bioindicators, *Heavy metals, *Aquatic plants, *Productivity, Rivers, *Lead, *Copper, Industrial wastes, Municipal wastes, *Connecticut, *Absorption.
Identifiers: *Gasoline combustion fallout, *Human influence, Pontederia, Potamogeton, Connecticut rivers.

The purpose was to determine the extent of heavy metal uptake by aquatic angiosperms and to ascertain whether concentrations in plant tissues are useful indicators of the amounts of these metals present in the environment. Significant differences were found in the concentration of lead and copper in plants (Pontederia and Potamogeton) growing in three Connecticut rivers which are subject to differing degrees of human influence. In general, concentrations of copper and lead were higher in below-ground Pontederia section than in the shoots. Lead concentrations of Pontederia tops were roughly comparable to these of whole Potamogeton plants. Copper concentrations of submersed and floating-leaved plants were much higher than those in Pontederia tops. Copper concentrations reflected the presence of a printed circuit factory in one area; variation in lead concentrations indicated differences in the amount of aerial fallout from the combustion of leaded gasoline, the major source of lead in the study area. Metal concentrations of Potamogeton appear to more nearly reflect the occurrence of copper and lead in river water, as the bottom substrate probably mediates the effects of river water on Pontederia. SIMULATION OF TWO-DIMENSIONAL CONTAMINANT TRANSPORT WITH ISOPARAMETRIC HERMITIAN FINITE ELEMENTS,
Princeton Univ., N.J. Dept. of Civil Engineering.
M. T. van Genuchten, G. F. Pinder, and E. O. Frind.
Water Resources Research, Vol. 13, No. 2, p 451-458, April 1977. 10 fig, 11 ref. EPA R803827-01.

Descriptors: *Pollutants, *Soil contamination, *Model studies, *Mathematical models, Mathematical studies, Mathematics, Finite element analysis, *Path of pollutants, Dispersion, Infiltration, Analytical techniques, Data processing, Groundwater movement.

A deformed isoparametric Hermitian element can be used in the simulation of two-dimensional contaminant transport. The degree of freedom arising from the cross derivative may be eliminated in the Galerkin-type finite element formulation, reducing the computational effort per node. Two example problems demonstrated that the Hermitian element gives results which are comparable to those obtained with the zero-order continuous cubic element but requires 25-40% fewer degrees of freedom, depending on the geometrical description of the problem. (Sims-ISWS)

EFFECT OF THE BOUNDARY SURFACE BETWEEN SEA AND FRESH WATERS ON THE DISTRIBUTION OF DISSOLVED OXYGEN IN THE MOUTH REGION OF THE DNIEPER RIVER,
Ye. P. Kirillova.
Soviet Hydrology, Selected Papers, No. 4, p 227-228, 1975. 1 fig, 3 ref. Translated from Trudy Gosudarstvennogo Okeanograficheskogo Instituta, No. 118, p 31-34, 1974.

Descriptors: *Estuaries, *Dissolved oxygen, *Rivers, Lagoons, On-site investigations, Saline water-freshwater interfaces, Sea water, Freshwater, Spatial distribution, Runoff, Foreign countries, Foreign research, Sediments, Turbidity, Oxygen, Water quality, Water chemistry.
Identifiers: *Dnieper River, *USSR.

Dissolved oxygen is one of the most important hydrochemical elements for the existence of aquatic organisms and for the decomposition of organic substances in a body of water. Oxygen distribution in the mouth area of the Dnieper is determined mainly by hydrologic-hydrochemical conditions that depend on the Dniepter runoff. The spatial distribution of oxygen in the mouth area of the Dnieper River was determined by the position of the boundary surface and water transparency, which are directly related to the freshwater runoff of the river. The largest zones with a high oxygen deficit form most frequently in summer, when the slopes of the boundary between fresh and salt waters are small. (Sims-ISWS)

SOURCES OF TAR POLLUTION ON ISRAELI MEDITERRANEAN COAST,
Israel Petroleum Inst., Tel-Aviv.
Y. Shekel, and R. Ravid.
Environmental Science and Technology, Vol 11, No 5, p 502-505, May 1977. 6 fig, 1 tab, 16 ref.

Descriptors: *Oil pollution, *Oil industry, Pollutants, *Oil wastes, *Oily water, Analytical techniques, Organic compounds, Solvent extractions, Oil, Fuels, International waters, Water pollution, Oil spills, Chemical analysis, Organic wastes, Gas chromatography.
Identifiers: Tar pollution, *Israeli Mediterranean Coast, *Curde oil, *Tar ball pollutants, *Israel, *Mediterranean Sea, Sulfur content, Vanadium/nickel ratio.

A survey was made to find the sources of tar balls polluting the Mediterranean coast of Israel. Samples were collected fortnightly from eight stations along the shore from September 1973 to January 1975. According to chromatographic analysis, 76% of the tar balls were formed from weathered crude oil (GC-1) + crude oil sludge (GC-2), 18% from weathered fuel oil (GC-3), 4% were greatly weathered, and 2% of the samples were unidentified. According to the vanadium/nickel ratio and sulfur contents, 96% of the tar balls formed from GC-1 + GC-2 were from Middle Eastern sources. The degree weathering of the samples showed that 46% of the tar balls formed from GC-1 + GC-2 were exposed at sea for about a fortnight, 41% for more than two months, and 13% probably for one to two years. (Henley-ISWS)

Identifiers: *Oceanographic baseline study, Predischarge investigation, *Barceloneta(Puerto Rico), *Manati River(Puerto Rico).

An interdisciplinary baseline study was conducted at an open ocean site on the north coast of Puerto

Rico. A sampling network of 27 water chemistry stations and 15 benthos/plankton stations was used to characterize the ocean water and sediment and to define the influence of the nearby Manati River. It was found that the Manati River, which presently receives the discharge of essentially raw domestic and industrial wastewater, was probably the source of most of the coliforms, turbidity, nitrates, nitrites, phosphorus, and silica in the study area waters. The river also may be the origin of arsenic, beryllium, chromium, and zinc. (Henley-ISWS)

SYSTEMATIC IDENTIFICATION OF DO-BOD MODEL STRUCTURE,
Cambridge Univ. (England). Control Div.
B. Beck, and P. Young.
Journal of the Environmental Engineering Division, Proceedings of the American Society of Civil Engineers, Vol. 102, No. EE5, Proceedings paper No. 12461, p 909-927, October 1976. 9 fig, 38 ref.

Descriptors: *Water quality, *Statistical methods, *Rivers, *Dynamics, *Dissolved oxygen, *Biochemical oxygen demand, Algal control, Estimating, Algorithms, Equations, Model studies.
Identifiers: Extended Kalman Filter, Human factors, Model tests, Recursive routines, Identification, Solar energy, Time factors.

The Extended Kalman Filter (EKF) provides a logical statistically-based extension to those existing approaches to model fitting based on deterministic model response error (surface) minimization. Its crucial feature as a basis for identification, however, is the recursive nature of the algorithm which permits the estimation of possible variations in the model parameters. Depending upon whether or not such estimated variations are realistic, bearing in mind the physical nature of the dynamic system, it is possible to formulate criteria for model adequacy. This approach to model identification was applied to the problem of modeling DO-BOD interaction in a freshwater river system based on daily field data. It was found that the basic model structure, as defined by a dynamic version of the Streeter-Phelps equations, was inadequate and, in the case of the river considered, it was necessary to introduce additional 'sustained sunlight' terms to account for the effects of floating algal populations. REAERATION AND VELOCITY PREDICTION FOR SMALL STREAMS,
Kentucky Univ., Lexington. Dept. of Civil Engineering.
E. G. Foree.
Journal of the Environmental Engineering Division, Proceedings of the American Society of Civil Engineers, Vol. 102, No. EE5, Proceedings paper No. 12448, p 937-952, October 1976. 6 fig, 3 tab, 9 ref.

Descriptors: *Water quality, *Computer models, *Reaeration, *Velocity, *Oxygenation, *Dissolved oxygen, Tracers, Streams, Low flow, Systems analysis, Equations, Dams, Height, *Kentucky, Waterfalls, Forecasting.
Identifiers: Dissolved oxygen analyzers.

The radioactive tracer technique employing dye, krypton-85 and tritium was utilized for the determination of reaeration and velocity characteristics of small streams. Based on work conducted over a 3-year period, models are developed to predict reaeration coefficient and velocity associated with a particular stream reach as a function of its slope and specific discharge (stream discharge per unit drainage basin area). Reaeration at dams is predicted as a function of the height of fall over the dam. These concepts have been incorporated into a general computer model for prediction of stream dissolved oxygen profiles and an example application is presented. (Bell-Cornell)

A CONCEPTUAL REPRESENTATION OF THE NEW YORK BIGHT ECOSYSTEM,
Water Resources Engineers, Inc., Walnut Creek, Calif.
D. McLaughlin, J. A. Elder, G. T. Orlob, D. F. Kibler, and D. E. Evenson.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-252 543, Price codes: A16 in paper copy, A01 in microfiche. NOAA Technical Memorandum ERL MESA-4, December 1975. 68 fig, 33 tab. Contract 3-35423.

Descriptors: New York, *Ecosystems, *Baseline studies, *Environmental effects, Estuaries, Water pollution, Fisheries.
Identifiers: *Outer Continental Shelf, *New York Bight, Resources management.

A comprehensive, conceptual representation of the physical, geological, chemical and biological processes that affect the New York Bight ecosystem is presented as well as some specific recommendations suggesting where field and laboratory research efforts should be undertaken to support a satisfactory evaluation of management alternatives. The important problems in the New York Bight are identified in order to develop effective strategies and research efforts towards solving them. They are: the movement of undesirable materials onto beaches, shellfish contamination, and a decline and instability in migratory fisheries. As each problem is described, the critical subsystems are identified, reviewed in the light of present knowledge, and a set of recommendations or research tasks for future implementation is proposed. Descriptors: *Water pollution effects, *Environmental effects, Water pollution sources, Boating, Lakes, Aquatic life, Lead, Organic compounds, Oil pollution.
Identifiers: Outboard marine engines.

The objective of the study was to obtain sufficient laboratory and field data to be able to predict the number of outboard engines which can be operated on any particular body of water without causing adverse effects on the aquatic environment. Four small natural bodies of water were subjected to outboard engine emissions three times greater than saturation (maximum) levels occurring under normal boating conditions. These natural water bodies were stressed at these high levels with outboard engine exhaust emission for a period of three years. The study showed that there were no acute changes in the physical, chemical or biological characteristics of the water or sediments of the test lakes. No major adverse effects were found on water quality or the biological communities (periphyton, phytoplankton, zooplankton, benthos and fish) indigenous to the test lakes. No adverse accumulation of lead or hydrocarbons in the water column was observed. Also, no statistically significant accumulation of lead or hydrocarbons was noticed to be taking place in the lake sediments. (Sinha-OEIS)

A TRANSIENT, TWO-DIMENSIONAL, DISCRETE-ELEMENT, FAR-FIELD MODEL FOR THERMAL IMPACT ANALYSIS OF POWER PLANT DISCHARGES IN COASTAL AND OFFSHORE REGIONS. PART I: GENERAL DESCRIPTION OF THE MATHEMATICAL MODEL AND RESULTS OF AN APPLICATION,
Oak Ridge National Lab., Tenn.
A. H. Eraslan.
Available from the National Technical Information Service, Springfield, VA 22161 as ORNL-4940, Price codes: A08 in paper copy, A01 in microfiche. Report to Nuclear Regulatory Commission, Washington, D.C., February 1975. 164 p, 79 fig, 1 tab, 62 ref. W-7405-eng-26.

Descriptors: *Thermal pollution, *Powerplants, *Environmental effects, *Resources development, Nuclear powerplants, *Mathematical models, Cooling water, Tides, Coasts, Ocean circulation, Model studies.
Identifiers: *Outer continental shelf.

A far-field mathematical model is presented for numerical simulation of short-time (within tidal cycle) transient, two-dimensional temperature distributions in large coastal and offshore regions resulting from the condenser cooling water discharges of power plants. The general mathematical formulation considers completely arbitrary, transient oceanic flow conditions, which include periodic tidal, geostrophic and wind-induced currents, as locally specified inputs to the model. The fundamental differences, both from physical and mathematical considerations, between mesoscale and micro-scale eddy turbulence, shear flow dispersion, and stratification are discussed in detail to establish a realistic formulation of depth-averaged, nonconvective thermal energy fluxes associated with the general turbulent transport phenomenon. The general mathematical model is applied to the assessment of the thermal impact of a hypothetical multiunit generating station in a coastal region where the oceanic flow conditions are assumed to be strictly periodic tidal currents without any appreciable net drift of sufficient duration to remove the heated effluent out of the far-field region. It is concluded that steady-state near-field studies of the individual discharges are definitely inadequate, and a transient far-field analysis which considers the variations in oceanic flow conditions is essential for the realistic assessment of the thermal impact of a large nuclear power plant in a coastal or offshore region. ANALYTICAL MODELS FOR THE EVALUATION OF SUPPLEMENTAL AERATION IN TEXAS ESTUARIES,
Texas A and M Univ., College Station. Dept. of Civil Engineering.
C. A. Benson, R. W. Hann, Jr., and T. W. Reynolds.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-252 544, Price codes: A07 in paper copy, A01 in microfiche. Sea Grant Report No. TAMU-SG-75-213, January 1976. 142 p, 22 fig, 15 tab, 4 append.

Descriptors: *Estuaries, *Aeration, *Mathematical models, *Water pollution control, *Texas, Dispersion, Waste disposal, Computer programs.

A one-dimensional dynamic mathematical model was developed for computer solution of estuarine dispersion problems. The math model was based on the one-dimensional mass transfer equation for the longtudinal distribution of a substance in a variable area stuary. Finite-difference approximations of the mass transfer equation were used to develop the numerical model. Model results showed that wastes are adequately degraded in the channel and do not accumulate to excessive levels. These results were compared with field data obtained from sampling runs in the Harbor Channel. This work showed that dispersion and dilution would greatly affect the oxygen transfer effeciency of a surface aeration system. Dissolved oxygen levels in the Houston Ship Channel, however, were determined to be the controlling factor affecting efficiency of aeration. Model results showed that inchannel aeration would not only improve oxygen levels in the channel, but greatly reduced the organic load discharged into Galveston Bay. Another conclusion was that tidal flows would have little influence on the efficiency of a surface aeration system operating on the Houston Ship Channel.

OCEAN DUMPING IN THE UNITED STATES - 1975, THIRD ANNUAL REPORT OF THE ENVIRONMENTAL PROTECTION AGENCY ON THE ADMINISTRATION OF TITLE I OF THE MARINE PROTECTION, RESEARCH, AND SANCTUARIES ACT OF 1972, AS AMENDED.
Environmental Protection Agency, Washington, D. C. Office of Water and Hazardous Materials.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-258 694, Price codes: A04 in paper copy, A01 in microfiche. Third Annual Report of the Environmental Protection Agency on Administration of Title I of the Marine Protection, Research, and Sanctuaries Act of 1972, as amended, June 1975. 66 p, 2 fig, 8 tab.

Descriptors: *Waste disposal, *Water pollution control, *Baseline studies, *Environmental effects.
Identifiers: *Outer Continental Shelf, *Ocean dumping, Dredged material disposal, Outfalls, *Resource management.

The Act became effective April 23, 1973, and since that time all ocean dumping of waste materials transported for the purpose of dumping has been done under permit from EPA except for dredged material, which is regulated by the Corps of Engineers. This annual report covers the second full year of regulation of ocean dumping by EPA under Title I of the Act, and it offers the first opportunity to make quantitative comparison of how ocean dumping has changed since the Act became effective. Eleven ocean dumping sites in the Atlantic Ocean and the Gulf of Mexico are now in active use for municipal and industrial wastes. There is no dumping of these wastes in the Pacific, although municipal sewage sludge is discharged to the ocean through outfalls. These discharges are regulated under the permit system. Ocean dumping site surveys are due to begin this year. A detailed baseline survey is currently being conducted in the New York Bight for an alternate site for sewage sludge disposal. EPA is also studying and evaluating two dump sites, one industrial and one municipal, off Delaware Bay, and is cooperating with NOAA in studies of a deepwater site off the continental shelf east of Cape Henlopen, Delaware. INDUCED VERTICAL MIXING IN A STRATIFIED IMPOUNDMENT BY A SUBSURFACE WARM WATER DISCHARGE,
Wisconsin University, Madison. Department of Civil and Environmental Engineering.
K. V. R. Henkel, Jr.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-269 025, Price codes: A15 in paper copy, A01 in microfiche. Ph.D. Thesis, 1973. 314 p, 58 fig, 7 tab, 73 ref, 6 append. OWRT B-080-WIS(5). 14-31-0001-3948.

Descriptors: *Water quality, *Stratification, *Heat exchangers, *Model studies, *Vertical migration, Mixing, Heated water, Impoundments, Thermal pollution, Cooling water.

This theoretical and experimental study investigated vertical mixing, induxed in a thermally stratified impoundment, by the introduction of a warm water discharge near the impoundment bottom. Laboratory tests, conducted in an 18 inch diameter, circular tank and a 4 foot square tank, varied the following variables systematically: (1) inlet velocity; (2) temperature difference between discharge and tank bottom water; (3) location of discharge; (4) surface layer thickness; and (5) initial temperature difference between tank surface and bottom layers. From the tests, correlations were found relating the time to mix each tank to various dimensional and non-dimensional combinations of the above variables. Coupling the conservation laws for volume and heat in the impoundment, including surface heat exchange, with those for volume, heat and momentum of a warm water discharge, a model was developed for the transient vertical thermal structure of an impoundment. The model, when applied to the laboratory tanks, agreed very well with the measured profiles. The model (without a warm water discharge), when applied to Lakes Mendota and Monona, showed reasonable agreement with observed temperature profiles. Comparisons were made between the simulated temperature profiles with and without a warm water discharge for Lake Monona. Consequences, potential problems and applications of condenser cooling water discharges for inducing vertical mixing in thermally stratified impoundments are discussed. Identifiers: *Channelized streams, Flood plain swamps, Eastern North Carolina, Swamp streams.

In 1974 the Water Resources Research Institute of The University of North Carolina funded this research project to investigate certain aspects of water quality in natural flood-plain swamps, and the perturbations in these water quality parameters resulting from stream channelization. Six streams were selected in the Atlantic Coastal Plain province of North Carolina just above the tidewater region. This area has a subtropical, moist climate with warm summers and cool winters. The mean annual rainfall is about 120 cm. Conclusions at thise point are - small Coastal Plain streams, natural or channelized, are dynamic. They exhibit marked seasonal changes in flow and in water quality. The waters of natural streams are soft, moderately acid, stained with brown color, and very low in nutrients, especially NO+3 and soluble reactive phosphorous. Oxxygen may nearly disappear in summer. The low-D.O. period coincided with the period of maximum NH+4, Kjeldahl-N, particulate-P, Fe, Mn, Ca, and Mg. The factors determining these seasonal patterns are not yet established but the redox potential and the relative importance of base flow vs. runoff seem likely. (Stewart-NC State)

Descriptors: *Agricultural runoff, *Water quality, Runoff, *Computer models, Forecasting, *Drainage, Simulation analysis, Watersheds(Basins), *Agricultural watersheds, Water pollution sources.
Identifiers: Agricultural pollution.

This project was designed to obtain additional needed information relative to agricultural pollution and to aid in the verification and development of computer models for simulation of this runoff. An agriculturally oriented watershed was instrumented to obtain information relative to rainfall and resulting runoff. In addition, data were obtained relative to cropping practices including chemical application, crop yields, etc. Data obtained are to be used in verifying and modifying available modeling techniques. Due to unusually dry weather during the summer of 1974, storm runoff was essentially non-existent after completion of instrumentation on July 1. As a result, data were not available for use. Therefore, information relative to the reliability of existing computer models is not included, but instead, a discussion is presented of various available modeling techniques and the basis for their use. The discussion also includes the sources and nature of various agricultural pollutants.

CHARACTERIZATION OF URBAN RUNOFF IN GREENFIELD, MASSACHUSETTS--PHASE I,
Massachusetts Univ., Amherst. Dept. of Civil Engineering.
F. A. DiGiano, M. P. Donahue, and P. L. Heirtzler.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-268 984, Price codes: A06 in paper copy, A01 in microfiche. Publication No. 50, July 1975. 102 p, 17 tab, 20 fig, 27 ref, 2 append. OWRT C-5341(No.4239)(1).

Descriptors: *Waste identification, *Water pollution sources, *Urban runoff, *Massachusetts, Sampling, *Monitoring, Measurement, Water quality, Phosphorus, Chlorides, Biochemical oxygen demand, Carbon, Sewers, Coliforms.
Identifiers: *Non-point pollution sources, Greenfield(Mass), *Green River(Mass), *Total organic carbon.

The primary interest of this research focuses on the importance of both the short term impacts on water quality requirements and the longer term disruptions to normal stream ecology that may be caused by urban runoff. This report includes water quality data obtained from April 1974 to June 1975. Sample points in the Green River were selected such that the contribution of urban runoff from various sources and land use patterns could be measured. Water quality data consist mainly of weekly measurement of specific parameters at 6 sampling stations in the river's urban reach and measured impacts of several storm events. Parameters of most interest are B.O.D., T.O.C., total P, Cl, turbidity, total and fecal coliforms, oil and grease. Increases in concentrations of most pollutat parameters were noted during wet weather. Mean loading rates were 269, 26, 15, and 717 lb/sq mile/day for B.O.D., T.O.C, total P, and chloride, respectively. However, combined sewer overflows increased loadings on several days and prevented accurate assessment of the urban runoff contribution.

Identifiers: *Water-cooled nuclear reactors, *Heated water pollution, *Savannah River Plant(SC), Bottom sediment adsorption, Hydroxy aluminum interlayers.

The adsorption of Cs137 by sediments from the Savannah River Plant follows a theoretically expected linear relationship between 1n Kd and 1/T where Kd and T are the equilibrium distribution coefficient (Cs adsorbed, meg/g/Cs(+) in solution, meq/m1) and the temperature in kelvins, respectively. The slope of the plots decreases after removal of hydroxy Al interlayers with citrate pretreatment. Hydroxy Al interlayers thus make Cs(+) adsorption more temperature dependent. The thermal effect of hydroxy Al interlayers becomes more significant in sediments containing a nonswelling 2:1-2:2 intergrade clay mineral than in those sediments containing a swelling 2:1-2:2 intergrade clay mineral. The phenomenon was explained by considering hydroxy Al interlayers as a source of hydronium ions H30(-) which compete with Cs(+) for exchange positions in wedge zones. An increase in temperature favors an increase in H30(-) ions, which in turn favors less adsorption of Cs(+). Aside from the thermal effect, the positively charged hydroxy aluminum polymeric groups drastically decrease the cation exchange capacity and, consequently, the adsorption of cesium. (Henley-ISWS)

NATURAL STREAM TEMPERATURE VARIATIONS IN A CATCHMENT,
Environment Protection Authority, Victoria (Australia).
J. H. Walker, and J. D. Lawson.
Water Research, Vol 11, No 4, p 373-377, 1977. 1 fig, 7 tab, 10 ref.

Descriptors: *Watersheds(Basins), *Water temperature, *Model studies, *Australia, Streams, Rivers, Temperature, Thermal water, Air temperature, On-site data collections, Cooling, Water cooling, Heat transfer, Water pollution, *Thermal pollution.

In order to establish water temperature criteria or limits for reaches of streams downstream from thermal discharges, a knowledge of the natural water temperature is necessary. To overcome the situation where no historical records are available, a simple method of predicting natural water temperatures in a catchment was presented. The only data required for computation are the site altitude and the air temperature at a station in the catchment, or the natural water temperature in an upstream reach or other tributary in the catchment. The time scale of the predicted water temperature is a function of the frequency of measurement of the independent variables. (Sims-ISWS)

DISPERSION MEASUREMENT ON THE DANUBE,
Research Inst. for Water Resources Development, Budapest (Hungary).
L. Somlyody.
Water Research, Vol 11, No 4, p 411-417, 1977. 7 fig, 2 tab, 16 ref.

Descriptors: *Dispersion, *Rivers, *Dye releases, *Model studies, Mathematical models, Dye concentration, Dye dispersion, Fluorescent dye, Tracers, Mixing, On-site investigations, Water quality, Foreign countries, Water pollution, Foreign research, Path of pollutants, Streamflow.
Identifiers: *Danube River, *Hungary, Dispersion coefficients.

In formulating the two-dimensional mixing model for a 52 km long section of the River Danube, the dispersion conditions were studied. Three tracer experiments were performed at two different streamflow rates (1900 and 1050 cu m/s) and at constant feed. For determining the transverse dispersion coefficient, a new method based on the equations of the mass flux constant line was developed. Examination of the observation data showed the dispersion coefficient pertaining to the greater streamflow to be more than twice as high as the one at the smaller streamflow (0.033 and 0.013 sq m/s). The variation with streamflow is approximated well by a formula. (Sims-ISWS)

SOLUTE TRAVEL TIMES TO WELLS,
Iowa State Univ., Ames. Dept. of Agronomy; and Iowa State Univ., Ames. Dept. of Physics.
D. Kirkham, and S. B. Affleck.
Ground Water, Vol 15, No 3, p 231-242, May - June 1977. 7 fig, 15 ref. NSF ENG75-19394.

Descriptors: *Groundwater, *Solutes, *Groundwater movement, *Travel time, *Model studies, Mathematical models, Aqueous solutions, Nitrates, Wells, Water wells, Water pollution, *Water pollution sources, Hydraulic conductivity, Aquifers, Rivers, Permeability.
Identifiers: Solute concentration.

Theoretical travel times were given for a solute to reach a well from an injection point for wells that fully penetrate confined aquifers of constant thickness and mainly constant conductivity and porosity. Solute is assumed to move along streamlines with the water in piston flow under steady flow conditions. Three cases were considered. (1) For a 'standard' well of external radius of influence r sub e and well radius r sub w, the travel time varies approximately directly as the square of the distance r of the injection point from the well, as the ratio f/K of porosity to conductivity, and as 1n r sub e/r sub w. (2) For a well in which the flow region is divided by radius r sub c into two regions, with the region next to the well clogged and of very low conductivity, K sub I, the travel time varies approximately directly as r squared, as f/K sub I, and as 1n r sub c/r sub w. (3) For a well being fed from a line drive (river) at a distance d from the well, the travel time from a point on the line drive to the well varies as the distance d squared, as f/K, as 1n 2d/r sub w, and as a function of the position of the point along the line drive. In each case, the travel time is inversely proportional to h sub e - h sub w, where h sub e is the head at the radius of influence r sub e (or at the line drive) and h sub w is the head at the well. In the three cases, doubling the pumping rate halves the travel time. Travel times can affect the extent of chemical changes of the solute (contaminant) during its flow to the well. (Sims-ISWS)

URBAN STORMWATER POLLUTANT LOADINGS: A STATISTICAL SUMMARY THROUGH 1972,
URS Co., San Mateo, Calif.
W. L. Bradford.
Journal Water Pollution Control Federation, Vol 49, No 4, p 613-622, April 1977. 5 tab, 18 ref. EPA 68-01-1846.

Descriptors: *Storm runoff, *Urban runoff, *Pollutants, *Mathematical studies, *Load distribution, Mathematics, Statistical methods, Statistics, Runoff, Surface runoff, Sampling, Data collections, Storm water, Watersheds(Divides), Drainage systems, Water pollution sources, Water quality, Water pollution, Suspended solids, Trace elements.

Identifiers: *Pollutant loadings, *Storm water composition, Coliform organisms, Total solids, Loading rates.

The data on urban storm water pollutant loading rates and composition available from the literature published through 1972 were used to find differences related to differing regions of the nation, gross land use types, average daily traffic, type of landscaping, and type of street surface. From 153 records, the mean and standard deviation of dust and dirt loading rates and composition were calculated for each of the independent variables listed and compared to those of the entire data set. Although apparent differences exist between subsets and the whole set of data, with some important exceptions, the null hypothesis was accepted at the 95% confidence level in most cases. To improve future analyses, study methods need to be more standardized than at present. (Henley-ISWS)

Kansas State Univ., Bulletin, KWRRI Contribution No. 104. Kansas Engineering Experiment Station, Special Report Number 110, July 19, 1972. 58 p, 14 fig, 2 tab, 13 ref. OWRT A-048-KAN(4), 14-31-0001-3516.

Descriptors: *Water quality, *Estimating, *Model studies, Optimization, Statistical methods.
Identifiers: Linear estimation, Stream modeling.

The various linear estimation schemes are discussed and summarized. The Kalman filter and the invariant imbedding filter are applied to the estimation of the parameters in stream quality modeling. The results are discussed in terms of convergence rate and the influence of noisy data. Statistical mismatch is also discussed. (See also W75-04614 and W75-01111)

ADSORPTION AND VERTICAL MOVEMENT OF THE ZINC AND MANGANESE IONS IN THREE TYPES OF SOIL,
Tuskegee Inst., Ala. Dept. of Plant and Soil Science.
R. J. Patel.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-269 191, Price codes: A05 in paper copy, A01 in microfiche. M. S. Thesis, August 1974, 76 p, 13 fig, 15 tab, 87 ref, append. OWRT B-028-ALA(5), 14-31-0001-3053.

Descriptors: *Adsorption, *Zinc, *Ions, Retention, *Manganese, *Soil types, Vertical migration, *Soil chemistry, Leaching, Chelation, Ion exchange, Path of pollutants, Water pollution, Metals.

The adsorption pattern of zinc and manganese ion was studied in three different types of soil: Hoytville, Nebraska and Troup. The soil samples were first leached with 1N ammonium acetate solution and were then equilibrated with the metal solutions of different concentrations ranging from 0.1 to 0.8 me, per gram of soil. The retention of these metals by the soils was evaluated in three different forms: exchangeable, chelated, and non-displaceable. To displace zinc and manganese held in the exchangeable and chelated forms, 1N KCl and 0.1 N Cu-(0Ac)2 solutions respectively were used. Adsorption data of the metals more used to compute the relative amount of soil material complexed with one mole of the cation and the stability constant of the resulting soil-metal complex. The data indicated that relatively more of zinc and manganese was adsorbed by the Hoytville soil than by the Nebraska or Troup soil. In general, the stability constant for the total adsorption of either zinc or manganese in any soil was comparatively greater than that for the other two fractions (chelated and non-displaceable) that were held in the soil. The concentration of zinc or manganese retained by the soils was more in the surface of the column and decreased progressively with depth.

SPECIES DIFFERENCES IN BREAKDOWN OF TREE LEAVES IN STREAMS--SIGNIFICANCE FOR COMPOSITION OF STREAM COMMUNITIES,
California Univ., Santa Barbara, Marine Science Inst.
A. M. Wenner, A. L. Busath, and R. P. Howmiller.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-269 194, Price codes: A03 in paper copy, A01 in microfiche. California Water Resources Center, Davis, Report No. 39, May, 1977. 29 p, 7 fig, 4 tab, 17 ref. (California Water Resources Center Project UCAL-WRC-W-492). OWRT-A-055-CAL(3).

Descriptors: *Riparian plants, *Invertebrates, Streams, *Leaves, *Decomposing organic matter, *Productivity, Detritus, Aquatic plants.

This report focuses on the possible influence of riparian vegetation on the composition and productivity of stream invertebrate fauna by concentrating on the role of decomposing matter in streams. Experiments were performed to determine decomposition rates of various leaf types, as well as on comparative survival and growth of selected stream invertebrates raised on single leaf types in artificial streams. A field survey was made of leaf types and invertebrates in local streams to discover any relationship between detrital and faunal composition. This study was unable to confirm any direct correlation between leaf litter composition and faunal composition. Data from some riffle samples and qualitative observations at the time of collection revealed no obvious absences in any stream. Riffle samples tended to have more insect predators than did litter samples were detected. (Snyder-California, Davis)

Available from Supt. of Documents, GPO, Washington, DC, 20402, Price 70c. Professional Paper 991, 1977. 39 p, 42 fig, 2 tab, 45 ref.

Descriptors: *Model studies, *Thermal pollution, *Natural streams, *Heat transfer, *Diffusion, Water temperature, Mathematical models, Analytical techniques, Evaluation, Path of pollutants.
Identifiers: *Surface heat dissipation, Thermal transport models.

The impact of thermal loading on the temperature regime of natural streams is investigated by mathematical models, which describe both transport (convection-diffusion) and decay (surface dissipation) of waste heat over 1-hour or shorter time intervals. The models are derived from the principle of conservation of thermal energy for application to one- and two-dimensional spaces. The basic concept in these models is to separate water temperature into two parts, (1) excess temperature due to thermal loading and (2) natural (ambient) temperature. This separation allows excess temperature to be calculated from the models without incoming radiation data. Natural temperature may either be measured in prototypes or calculated from the model. If use is made of the model, however, incoming radiation is required as input data. Comparison of observed and calculated temperatures in seven natural streams shows that the models are capable of predicting transient temperature regimes satisfactorily in most cases. (Woodard-USGS)

nvestigations were made by the U.S. Geological
urvey in cooperation with Teton County, Wyom-
g and the National Park Service to determine the
ffects on nearby lakes and streams of percolating
astewater effluent at three sites in and near
rand Teton National Park. Observation wells
ere drilled at two of the sites, and water samples
ere collected from the wells. Sites were
stablished on selected streams to collect water
amples and to measure streamflow. Sufficient
ata have not been collected at this time to deter-
ine in detail the baseline quality of water in the
elected streams or the rate, direction, and
elocity of movement of percolating effluents.
lowever, theoretical concepts and data collected
o date suggest that effluent percolating near
olter Bay Village is most likely moving westward
nd southwestward toward Swan Lake and Colter
ay. Effluent percolating near Moose is most like-
y moving southeastward and southward toward
he Snake River. Effluents near Flagg Ranch and
luckleberry Hot Springs probably discharge into
he Snake River and Polecat Creek, but the
mounts are small. (Woodard-USGS)

igation, Weight gains.

opulation characteristics and heavy metal con-
entrations of cottontail rabbits and small mam-
nals were compared on control and effluent
prayed areas during 1971, 1972, and 1973. Popula-
ion densities of rabbits in irrigated enclosures
ended to be higher for 3 consecutive years though
lensities were not significantly different. Rabbit
veights and adult weight gains were higher on ir-
igated areas. Wastewater irrigation of forested
reas in early successionary stages appears to in-
rease the carrying capacity for cottontail rabbits
ecause of increased food and cover produced by
he irrigation. Small mammal population densities were greater in the fall on irrigated areas and were probably related to increased production of herbaceous vegetation throughout the growing season. Spring densities on both irrigated and non-irrigated areas were not different, indicating no increase in carrying capacity over the winter months. Levels of most heavy metals in the tissues of cottontails and small mammals were not increased by wastewater irrigation. (Sink-Penn State)

Identifiers: *Glycogen, *Bacteria survival rate.

The survival of Escherichia coli B and Salmonella typhimurium was studied in polluted river water in situ and in controlled laboratory conditions. The die-off of both bacteria was very rapid in the river and the initial cell population was reduced by 90% in less than three days at the temperatures tested in the river (16 and 27.8 C.). In the laboratory conditions, E. Coli and S. typhimurium were reduced at 10 C. by 90% in 15 days and 13 days respectively. At 20 C. both bacteria were reduced by 90% within five days and at 25 C. a 90% reduction occurred in approximately two days. At 30 C. E. coli took ten days for a 90% reduction in viability while S. Typhimurium took less than 48 hours for the same viability loss. The role of glycogen in survival of both organisms seemed insignificant, as glycogen rich E. coli and S. typhimurium did not survive longer than cells with lower glycogen content with the exception of glycogen-rich E. coli at 25 C. HEAVY METAL TOLERANCE OF MARINE PHYTOPLANKTON. III. COMBINED EFFECTS OF COPPER AND ZINC IONS ON CULTURES OF FOUR COMMON SPECIES,
Trondheim Univ. (Norway). Inst. of Marine Biochemistry.
G. S. Braek, and A. Jensen.
Journal of Experimental Marine Biology and Ecology, Vol 25, 1976, p 37-50, 8 fig, 6 tab, 12 ref.

Descriptors: Environmental effects, Metals, *Water pollution effects, Resistance, Copper, Zinc, Phytoplankton, Diatoms, Algae, *Heavy metals.
Identifiers: Synergism, Combined effects.

The combined effects of copper and zinc ions were studied using three marine diatoms and one dinoflagellate. Results showed that joint effects of copper and zinc on marine phytoplankton could not be predicted on the basis of the toxicity of the individual metals. A. carteri and T. pseudonana gave clear cases of synergism, while the metals acted as antagonists towards the diatom P. tricornutum. For the two clones of S. costatum tested it was found that the effect of combinations of the metals was greater than the sum of the effects caused by the components applied separately, although the sensitivity of S. costatum to copper did limit the range of the experiments. MUSSELS (MYTILUS SP.) AS AN INDICATOR OF LEAD POLLUTION,
Scripps Institution of Oceanography, La Jolla, Calif.
T. J. Chow, H. G. Snyder, and C. B. Snyder.
The Science of the Total Environmental, Vol 6, 1976, p 55-63, 3 tab, 1 fig, 16 ref.

Descriptors: Environmental effects, *Water pollution, *Lead, *Mussels, Marine animals, Shellfish, Pacific Coast, *Bioindicators, Pollutant identification, Water pollution effects.

Two species of mussels (M. californinanus and M. edulis) were collected along the Pacific Coast from Piedras Blancas to Punta Banda. The area depicts varying degrees of industrialization ranging from relatively undisturbed to heavily populated regions. On a dry weight basis, the whole soft parts of the mussels contained from 0.27 to 42 ppm of lead which could be related to their local habitats. Gill tissues contained the highest amount of lead. No difference was observed in the average isotope ratios of lead in the two species. (Chilton-ORNL)

ESTIMATION AND EVALUATION OF RADIOACTIVE CONTAMINATION THROUGH A FOOD WEB IN AN AQUATIC ECOSYSTEM: I. AN APPLICATION OF THE COMPARTMENT MODEL TO TRANSFER OF RADIOACTIVE SUBSTANCES THROUGH A FOOD CHAIN,
Kyoto Univ. (Japan). Dept. of Sanitary Engineering.
I. Aoyama, and Y. Inoue.
J Radiat Res. 14(4), p 375-381, 1973.

Descriptors: *Radioactivity effects, *Aquatic environment, *Model studies, *Food chains, *Fish, *Radioecology, Food webs, Sea water, Ecosystems, Absorption, Radioisotopes, Transfer, Pikes, Cichlids, Minnows, Cesium, Water pollution effects.
Identifiers: Cesium-137, Radioactive transfer, Compartment model.

A transfer of radioactive substance through a food chain in an aquatic ecosystem was analyzed through application of modified 3 compartment model of Aten's. The modification of the original model is an introduction of 2 processes, an excretion of radioactivity from Fish-1 (prey) to sea water and an direct uptake of radioactivity by Fish-2 (predator) from sea water. In the model, a following ration rate coefficient (k12) was defined as a mass transfer coefficient of a radioactive nuclide from prey to a predator; k sub 12 = theta M sub 1/M sub 2, where theta is an assimilation rate of a radioactive nuclide, M sub 1 is a daily average ration taken by a predator and M sub 2 is a weight of the predator. In the experimental

system, pike cichlids and minnows were used as predators and prey. 137Cs was used as a radionuclide in the system. The accumulation of a 137Cs in pike was explained by application of the above modified 3 compartment model and various parameters in the model were determined. This shows that the transfer of a radionuclide through a food chain can be estimated by knowing the uptake rate and the turnover rate of Fish-2 (predator). They in ecological term are a daily average ration and an assimilation rate respectively.--Copyright 1974, Biological Abstracts, Inc.

THE ROLE OF METHYLMERCURY PRODUCTION IN THE TRANSFER OF MERCURY IN A SALT MARSH ECOSYSTEM,
Skidaway Inst. of Oceanography, Savannah, Ga.
H. Windom, W. Gardner, J. Stephens, and F. Taylor.
Estuarine and Coastal Marine Science, Vol. 4, 1976, p 579-583, 2 tab, 13 ref. NSF (GX-33615).

Descriptors: Environmental effects, *Water pollution effects, *Mercury, *Path of pollutants, *Salt marshes, Sediments, Algae, Ecosystems, Estuarine environment, Estuaries, Georgia, Industrial wastes.
Identifiers: Primary consumers, *Methylmercury, Brunswick area(Geo).

A salt marsh estuary which had received large discharges of inorganic mercury for several years was studied. The concentration of mercury in sediments from the study area are higher than those from unpolluted salt marsh estuaries of the southeastern Atlantic coast. The methyl form was not detected in either the sediments or Spartina alterniflora. The primary consumers of the ecosystem represented the first trophic level which accumulated methylmercury with Littorina irrorata and Uca sp representing over 90% of the production at this level. The data indicated an annual methylmercury production in this ecosystem of approximately 50 microg/g total Hg contained in the upper 5 cm of the sediment. (Chilton-ORNL)

DOSE-DEPENDENT EFFECTS OF METHYLMERCURY ON LIMB REGENERATION OF NEWTS (TRITURUS VIRIDESCENS),
Wisconsin Univ.-Madison. Dept. of Anatomy; and Wisconsin Univ.-Madison. Dept. of Pathology.
L. W. Chang, L. L. M. Mak, and A. H. Martin.
Environmental Research, Vol. 11, 1976, p 305-309, 2 fig, 33 ref.

Descriptors: Environmental effects, *Water pollution effects, *Mercury, *Newts, Growth rates.
Identifiers: Regeneration, Cell growth, Tissue development, *Methylmercury, Dose-dependence.

Newts with amputated limbs were raised at a temperature of 25 C in solutions containing various concentrations of methyl mercuric chloride (0.01, 0.03, 0.05, 0.07, 0.1, 0.3, and 1.0 ppm). A general but significant delay in regeneration was observed in animals raised in mercury-water as compared to controls. The rate of regeneration in all the mercury-exposed animals seemed to be potentiated after the initiation of the regeneration. It was concluded that methylmercury has a dual inhibitory and stimulatory effect on cell growth and tissue development and that its effect is dose-dependent. (Chilton-ORNL)
W77-08699

METHYLMERCURY INDUCED INJURY OF SINGLE BARNACLE MUSCLE FIBERS,
Wisconsin Univ., Madison. Dept. of Physiology; and Wisconsin Univ., Madison. Dept. of Medicine.
H. Hift, and R. Schultz.
Environmental Research, Vol. 11, 1976, p 367-385, 22 fig, 20 ref.

Descriptors: Environmental effects, *Water pollution effects, *Mercury, Toxicity, Sodium.
Identifiers: *Methylmercury, Muscle fibers, *Barnacles.

The effects of methylmercury on sodium transport, resting membrane potential, and ultrastructure of single barnacle muscle fibers were investigated. The results showed that methylmercury reduces sodium transport and that its primary site of action is the plasmalemma which deteriorates progressively. Experiments with ouabain indicated that the membrane sodium, potassium-ATPase system was affected by methylmercury. It was suggested that the observed reduction in Na efflux was the result of a reduced supply of ATP and that the terminal rise in Na efflux was the result of the destruction of the sarcolemma. Ultrastructure damage consisted of mitochondrial changes, the gradual disintegration of the sarcoplasmic reticulum, and the formation of gaps in the plasmalemma. (Chilton-ORNL)
W77-08700

EFFECTS OF MERCURY, CADMIUM, AND LEAD SALTS ON REGENERATION AND ECDYSIS IN THE FIDDLER CRAB, UCA PUGILATOR,
Rutgers - The State Univ., Newark, N.J. Dept. of Zoology and Physiology.
J. S. Weis.
Fishery Bulletin, Vol. 74, No. 2, 1976, p 464-467, 2 tab, 15 ref. N.I.H. Biomedical Grant No. RR 7059.

Descriptors: Environmental effects, *Water pollution effects, *Mercury, *Cadmium, *Lead, *Crabs, Salts.
Identifiers: Regeneration, Ecdysis, *Accabonac Harbor(NY).

Retardation of regeneration was a specific effect of cadmium on crabs exposed to concentrations of both 0.1 and 1.0 mg/l. At 0.1 mg/l, mercury caused almost total inhibition of limb growth but also proved lethal to 60% of the crabs indicating that the inhibition of regeneration may be not be a specific effect of mercury but an indication of the toxicity of the metal. A seasonal difference in sensitivity to both dose levels of cadmium and the higher concentration of mercury was seen, with the greater retarding effects being apparent during molting. (Chilton-ORNL)
W77-08702

TRACE ELEMENT INVENTORY FOR THE NORTHERN CHESAPEAKE BAY WITH EMPHASIS ON THE INFLUENCE OF MAN,
Maryland Univ., College Park. Dept. of Chemistry.
G. R. Helz.
Geochimica et Cosmochimica Acta, Vol. 40, No. 6, 1976, p 573- 580, 4 tab, 2 fig, 51 ref.

Descriptors: *Water pollution effects, *Water pollution sources, Pollutants, *Trace elements, *Chesapeake Bay, Sediments, Aqueous solutions, Industrial wastes, Municipal wastes, Fallout, *Maryland.
Identifiers: *Baltimore Harbor(Md).

An estimate of input from various sources of nine trace elements to the northern Chesapeake Bay revealed that human sources supply at least half of the Cr, Cu, Cd, and Pb. Human input is somewhat less for Mn, Fe, Co, Ni, and Zn. Atmospheric sources were the most important for Pb; municipal wastewater was the dominant source for Cd and heavy industry of Cu and Cr. Generally less than 1/3 of the present input could be accounted for in the sediments, with the exception of Cr and Fe. Sediments in areas of high human input (Baltimore Harbor) become enriched in an amount roughly proportional to the increased input so that the fraction retained in the sediments is similar to that in less heavily loaded area. (Chilton-ORNL)

AN EVALUATION OF THE NATIONAL EUTROPHICATION SURVEY DATA,
National Eutrophication Survey, Corvallis, Oreg.
M. O. Allum, R. E. Glessner, and J. H. Gakstatter.
Working Paper No 900, June 1977. 82 p, 68 ref, append.

Descriptors: *Eutrophication, *Evaluation, Algae, *Lakes, *Trophic level, Bioassay, *Nutrients, Data collections, *Phosphorus, *Nitrogen, *Primary productivity, Water pollution effects, *Surveys, Organic loading.

Because of the nation-wide scope of the National Eutrophication Survey and the time frame of less than four years for the completion of the sampling of 812 lakes and reservoirs, 4,000+ tributary sites, and over 800 municipal wastewater treatment plants, the Survey sampling program necessarily deviated from what ordinarily would be considered an ideal experimental design. As the Survey progressed, and to the degree permitted by the day-to-day work load, limited comparisons of Survey results with results published by others on the same water bodies were made. Specifically, it is concluded that: (1) the Survey water-body data compare very well with the reported data reviewed, considering the expected variability; (2) the trophic condition of most lakes and reservoirs can be adequately assessed on the basis of three periods of open-water sampling; (3) whether nitrogen, phosphorus, or some other element is limiting primary productivity in a water body can be inferred from algal assay results and nitrogen to phosphorus ratios; (4) considering temporal and spatial variability in nutrient concentrations, the Survey tributary nutrient data compare very well with the data reported by others; (5) for the purposes of the Survey, tributary nutrient loads were determined with acceptable accuracy with a sampling frequency of 14 times per year and flow data provided by the U.S. Geological Survey; (6) the Survey tributary total phosphorus loads and the in-water-body total phosphorus concentrations are highly correlated; (7) the effluent total phosphorus loads measured at 801 municipal wastewater treatment plants are in good agreement with expected values. (EPA-Corvallis)

NEOPLASTIC AND POSSIBLY RELATED SKIN LESIONS IN NEOTENIC TIGER SALAMANDERS FROM A SEWAGE LAGOON,
Texas Tech Univ., Lubbock. Dept. of Biological Sciences.
F. L. Rose, and J. C. Harshbarger.
Science, Vol. 196, No. 4287, p 315-317, April, 1977. 1 fig, 8 ref.

Descriptors: *Cytological studies, *Salamanders, *Growth stages, *Lagoons, *Monitoring, Water

pollution effects, Chemical reactions, Biochemistry, Diseases, Water pollution, Waste water treatment, Settling basins.
Identifiers: Neoplasms, Carcinogens, Tiger salamanders, Skin lesions.

Neoplastic and other skin lesions were studied in neotenic tiger salamanders growing in a lagoon with high concentrations of secondary domestic sewage. Thirty to fifty percent of a 28,000 population developed skin lesions of which 84% were neoplasms. Salamanders in uncontaminated area lagoons developed normally with no neoplasms. Nonneoplastic lesions found were ascites, serous cysts, and epidermal inclusion cysts. Ascites were common to both test populations. The neoplastic lesions developed from skin epithelium, dermal fibroblasts, or dermal melanocytes. Water analyses were negative for 14 nitrosamines, but sediment analyses revealed 300 ppm of perylene, from jet fuel, and trace amounts of benzypyrene. Perylene has caused low tumorigenic activity in mice when combined with other polycyclic aromatic hydrocarbons. Tests should be conducted to determine its effects on salamanders. Metamorphic failure was determined to be a factor in tumorigenesis. Tiger salamanders were considered to be sensitive indicators for certain environmental carcinogens and could possibly monitor sewage ponds. Other vertebrate and invertebrate larval forms could be developed for such purposes by hormonally prolonging the length of the immature stages. (Collins-FIRL)

BIOLOGICALLY ACTIVE METABOLITES OF BLUE-GREEN ALGAE AND THEIR EFFECT ON EXPERIMENTAL ANIMALS, (IN RUSSIAN),
Kiev Research Inst. of General Communal Hygiene (USSR).
V. M. Orlovskii, and Yu. A. Kirpenko.
Gig Sanit 3, p 13-17, 1976.

Descriptors: *Algae, *Algal poisoning, *Anabaena, *Cyanophyta, Reservoirs, Metabolism, Water pollution effects.
Identifiers: Anabaena flos-aquae, Aphanizomenon flos-Aquae, Alga, Blooming, Carbohydrate oxidation, Blood catalase, Cholin esterase, Liver, Metabolites, Microcystis aeruginosa, Myo cardium, Thiaminease, USSR, Pyruvic acid.

Water from the Kremenchug reservoir (USSR) during blooming of blue-green algae, predominantly Microcystic aeruginosa, Aphanizomenon flos-aquae and Anabena flos-aquae, was administered daily to rats for 2.5 mo. Results indicated lowered cholinesterase and blood catalase activity, lower overall thiamine in the organs, the presence of thiaminase, higher concentrations of insufficiently oxidized products in the blood (particularly pyruvic acid) and degenerative changes in the liver and myocardium. Disturbances of carbohydrate oxidation is one of the basic elements of the mechanism of toxic action on warm-blood animals. The possiblity of exposure of humans and animals to biologically active metabolites of blue-green algae indicates that the blooming in water is a potential factor in the decrease of water quality and may lead to adverse consequences.

Identifiers: *Nutritional deficiencies, *Pathogens, Flavobacterium, Aeromonas, Flexibacter, Chondrococcus, Immunoglobins, Antibodies, Cultured catfish.

A total of 321 channel catfish cases are examined in this report. Fish kills were caused by viruses, bacteria, parasites, nutritional deficiencies, pesticides and water quality. Channel catfish eggs were destroyed by Flavobacterium sp. Field testing of Aeromonas hydrophila and Flexibacter (Chondrococcus) columnaris was carried out. Immunoglobulins in the serum, gut and skin mucous are characterized. Levels of antibody in the serum, gut and mucuous are determined. Homogenetic and heterogenetic strains of channel catfish were tested for their susceptibility to F. columnaris. (Katz)

FATE AND BIOLOGICAL EFFECTS OF MERCURY INTRODUCED INTO ARTIFICIAL STREAMS,
Savannash River Ecology Lab., Aiken, S.C.
H. J. Kania, R. L. Knight, and R. J. Beyers.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-258 833, Price codes: A07 in paper copy, A01 in microfiche.
Environmental Protection Agency, Ecological Research Series, Report EPA 600/3-060, August 1976. 128 p, 5 tab, 52 fig, 91 ref, append.

Descriptors: *Mercury, *Metals, Streams, *Food chains, Aquatic animals, Water pollution, *Aquatic algae, *Aquatic microbiology, Sediments, Freshwater, Fishes, Invertebrates, Aquatic populations, Fish food organisms, *Periphyton, Laboratory tests, Methodology, Aquatic insects, Water pollution effects, Bioassay.
Identifiers: *Artificial streams, *Total mercury analyses, Periphytic communities, Tissue concentration, Periphytic algae, Life stage inhibition, Life stage stimulation, *Benthic insect communities.

Mercuric ion was continuously input to artificial stream channels to provide water concentrations of 0.01, 1.0 and 5.0 ug/l. Channel components were periodically sampled for total mercury analyses. The effects of mercury on the algal components of the periphytic communities and on the benthic insects were determined. The sampling program continued one full year after mercury inputs were stopped. Approximately 15% of the added mercury was removed from the water. The community components acquired very high concentrations of mercury, although in most cases the levels in these were not a linear function of the water levels. Concentrations in invertebrates decreased most rapidly after mercury inputs were stopped while the sediment levels decreased most slowly. Periphytic algae showed several treatment responses including total inhibition, inhibition of certain life stages, possible stimulation of certain life stages and morphological alterations. One species was found only in the treated channels and disappeared when mercury inputs were stopped. The diversity and evenness of benthic insect communities were affected by mercury treatment. (Katz)

EFFECTS OF A SPILL OF MARINE DIESEL OIL ON THE MEIOFAUNA OF A SANDY BEACH AT PICNIC BAY, HONG KONG,
Chinese Univ. of Hong Kong. Dept. of Biology.
A. P. Wormald.
Environmental Pollution, Vol 11, p 117-130, 1976. 3 fig, 4 tab, 19 ref.

Descriptors: Environmental effects, *Toxins, *Water pollution effects, Populations, *Oil spills, *Copepods, *Oil pollution, *Biological communities, Beaches, *Nematodes, Invertebrates, Oil, Food chains, Sediments, Water pollution, Sampling, On-site data collections, Tropical regions, Mortality.
Identifiers: *Picnic Bay(Hong Kong), *Marine diesel oil, *Meiofauna, *Harpticoids, Recolonisation.

The meiofauna of littoral sandy beaches in Picnic Bay, Hong Kong, was almost totally destroyed within four days of pollution by a heavy marine diesel oil in November, 1973, and recovery was monitored over the following 14 months. A few nematodes reappeared within one month of the spill but harpacticoids did not return in any numbers for 8 months, by which time the oil content had decreased by 50%. Apparently normal populations were established by September, 1974, the lower shore supporting much larger numbers than the steeper, coarser and drier upper shore. By January, 1975, Picnic Bay supported larger meiofauna communities than an unaffected shore, although numbers are lower than reported elsewhere at these latitudes. (Katz)
W77-08760

TOXICITY OF INTERMITTENT CHLORINATION TO BLUEGILL, LEPOMIS MACROCHIRUS: INTERACTION WITH TEMPERATURE,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Biology.
M. L. Bass, and A. G. Heath.
Bulletin of Environmental Contamination and Toxicology, Vol 17, No 4, p 416-423, April 1977. 2 fig, 3 tab, 11 ref.

Descriptors: *Toxicity, *Lethal limit, *Mortality, *Water temperature, *Chlorine, *Sunfishes, *Stress, Fish behavior, *Bioassay, *Heated water, Thermal pollution, *Chlorination, Water pollution sources, Water pollution effects, Environmental effects, Powerplants.
Identifiers: *Lepomis, *Sublethal effects, LT50, LC50.

Juvenile bluegills (Lepomis macrochirus) were held in test aquaria at 6, 15, 25 and 32C and were exposed to chlorine concentrations of 0.21, 0.31, 0.41, and 0.52 mg/l, three times a day for seven days. This was to simulate the intermittent release of chlorine into streams or lakes from power plants. Although no deaths occurred at 0.2 mg/l peak total chlorine, the behavior of fish at the two highest temperatures indicated that they were under stress. A distinct threshold of 0.3 mg/l peak total chlorine was observed, at which chlorine becomes toxic to bluegills. A notable temperature effect was found at peak total chlorine of 0.52 mg/l where the LT50 was 74 h at 6C and decreased to about 20 h at 32C. The 96 h LC50 was approximately 0.40-0.45 mg/l peak total chlorine at all four temperatures. Most of the total residual chlorine was in the free form which has a greater toxicity that combined chloramine forms. (Katz)
W77-08761

PHYTOPLANKTON STANDING CROP AND SEWAGE NUTRIENT ENRICHMENT ALONG THE CENTRAL COAST OF LEBANON,
American Univ., Beirut (Lebanon). Dept. of Biology.
J. T. Hardy, and Z. Jubayli.
Environmental Pollution, Vol 11, p 195-202, 1976. 1 tab, 3 fig, 14 ref.

Descriptors: *Primary productivity, *Biomass, *Standing crops, *Phytoplankton, *Domestic wastes, *Sewage effluents, *Seasonal, *Chlorophyll, *Ammonia, *Nitrates, *Nitrites, *Phosphates, *Nutrients, *Productivity, Sewage disposal, Water pollution effects, Environmental effects, Nitrogen compounds, On-site data collections, Sampling.

Identifiers: *Lebanon.

Surface nearshore water samples from seven stations along the central coast of Lebanon were analysed at different seasons for concentrations of nitrate, nitrite, ammonia, phosphate, and chlorophyll-a standing crop. Concentrations of nutrients and chlorophyll-a are higher with a 10 km long coastal zone south of Beirut and increase with decreasing distance from two major untreated sewage outfalls. In some cases, chlorophyll-a standing crops near outfalls are about 10 times greater (at 2.18 mg per cubic meter) than unenriched stations further south or than values reported from elsewhere in the eastern Mediterranean. Near outfalls, concentrations of phosphate, ammonia, and chlorophyll-a tend to be greatest in summer, while nitrate is highest in winter. Preliminary measurements by carbon-14 assimilation indicate that the enriched coastal region has a higher rate of primary production than the unenriched area more than 10 km south of Beirut. (Katz)
W77-08762

FATE OF LABELED N-ALKANES IN THE BLUE CRAB AND STRIPPED MULLET,
University of Southern Mississippi, Hattiesburg. Dept. of Biology.
P. C. Geiszler, B. J. Grantham, and G. J. Blomquist.
Bulletin of Environmental Contamination and Toxicology. Vol 17, No 4, p 463-465, April, 1977. 2 fig, 1 tab, 12 ref.

Descriptors: *Metabolism, *Absorption, *Organic compounds, *Path of pollutants, *Bioassay, *Crabs, *Mullet, *Tracers, Invertebrates, Marine fish, Laboratory test, Analytical techniques, Radiochemical analysis.
Identifiers: *Mugil, *Callinectes, *Tissue analysis.

To examine the differences in the metabolic capabilities of invertebrates and fish, a study on the uptake, discharge and metabolism of long chain n-alkanes in the blue crab Callinectes sapidus and the stripped mullet Mugil cephalus was undertaken. Organisms were exposed to the hydrocarbons either in the test water or by introduction into the digestive tract. After exposure to labeled n-tricosane for 24 hours, an average of 52,000 cpm of labeled hydrocarbon per crab was taken up. Little was retained with averages of 14,000 cpm, 9,000 cpm and 4,000 cpm after 3, 7, and 14 days, respectively. Blue crabs did not metabolize n-alkanes. In contrast, n-alkanes taken up via the digestive tract in mullet were readily metabolized, probably via microorganisms in the gut. More limited metabolism was observed in mullet when n-alkanes were taken up via the gills. (Katz)
W77-08764

TOXICITY TO FISH OF FLAME RETARDANT FABRICS IMMERSED IN THEIR WATER. PART I,
Cornell Univ., Ithaca, N.Y., Dept. of Veterinary Pathology.
G. A. Maylin, J. D. Henion, L. J. Hicks, L. Leibovitz, and V. D. Ahrem.
Bulletin of Environmental Contamination and Toxicology, Vol 17, No 4, p 499-504, 1977. 3 tab, 6 ref.

Descriptors: *Toxins, *Toxicity, *Bioassay, *Mortality, *Inhibitors, *Bromine, *Phosphorus compounds, *Fish physiology, Laboratory test, Enzymes, Biochemistry, Freshwater fish.
Identifiers: *Flame retardants, *TDBPP, *Tris, *Carassius, Goldfish.

A number of commercial and candidate flame retardants were studied with regard to their toxicity to fish when released from fabrics immersed in their water. Immersion of laundered or unlaundered flame retardant 100% polyester or polyester blend fabrics used in children's sleepwear in water containing goldfish (Carassius auratus) resulted in release of the anticholinesterase flame retardant TDBPP (tris (2,3-dibromopropyl) phosphate) and death of all fish within 24 hours. TDBPP undergoes loss of HBr in water and production of a metabolite. (Katz)

THERMAL ACCLIMATION, UPPER TEMPERATURE TOLERANCE, AND PREFERRED TEMPERATURE OF JUVENILE YELLOWTAIL SNAPPERS, OCVURUS CHRVSURUS (BLOCH) (PISCES: LUTJANIDAE),
Auburn Univ., Ala., Dept. of Fisheries and Allied Aquacultures.
R. K. Wallace, Jr.
Bulletin of Marine Science, Vol. 27, No. 2, p. 292-298, 1977 1 tab., 3 fig., 27 ref.

Descriptors: *Thermal pollution, *Water temperature, *Thermal stress, Thermal water, Bioassay, Laboratory tests, *Mortality, Fish physiology, Fish behavior, Marine fish, Water pollution effects, *Lethal limit, Juvenile fish.
Identifiers: *Thermal acclimation, *Thermal tolerance, Yellowtail snappers, Ocvurus, *Lethal temperature, *Upper thermal tolerance, Lethal temperature, Lower temperature limit, *Preferred temperature.

The rate of acclimation and temperature tolerance of juvenile yellowtail snappers, Ocvurus chrvsurus (Bloch) was tested using the method of sudden exposure to elevated temperature. Acclimations of upto 10 days at various temperatures did not significantly change the 24-hour lethal temperature from that of a 1-day acclimation. Upper thermal tolerance was tested after 3-day acclimations at 20, 24, 28, 30, and 32C. Lethal temperatures (for a 7-day exposure) ranged from 32.6C at a 20C acclimation to 35.5C at a 32C acclimation. No significant relationship was found between acclimation temperature and lethal temperature. The ultimate lethal temperature was estimated to fall between 33.5 and 34C. Acclimation significantly raised resistance times at test temperatures of 34 and 35 An upper thermal tolerance polygon of 108.8 un was constructed by arbitrarily considering 18C the lower temperature limit for juvenile yellowt snappers. Preferred temperature was tested by a climating and then exposing fish to a horizon temperature gradient. Acclimation altered t mean preferred temperature, but the preferr temperature remained within the range norma encountered (24-30C) by O. chrysurus. (Katz)

METHOD FOR DETERMINING ACUTE TO ICITY OF AN ACID WASTE AND LIMITIN PERMISSIBLE CONCENTRATION AT BOU DARIES OF AN OCEANIC MIXING ZONE,
EG and G Environmental Consultants, Waltha Mass.
C. D. Rose, W. G. Williams, T. A. Hollister, and R. Parish.
Environmental Science and Technology, Vol. No. 4, p. 367-371, April 1977. 3 tab., 3 fig., 10 ref.

Descriptors: *Sea Water, *Toxicity, *Acid water, *Mortality, *Hydrogen ion concentratio *Lethal limit, *Methodology, *Acid-base equilib um, *Acidity, *Alkalinity, *Mixing, *Water qua ty control, Bioassay, Water quality, Alkali water, Neutralization, Saline water, Laborato tests, Water pollution control.
Identifiers: *Acid wastes, Acartia.

A new method is described for determining mo tality of bioassay organisms attributable to acid and nonacidic constituents of an acid waste a for using these measurements to derive a limiti permissible concentration for the whole waste boundaries of an oceanic mixing zone. The meth reports mortality attributable to the acidic co stituent in terms of its direct cause--hydrogen i concentration of bioassay water. Titration of ac waste into a representative sample of seawat from the mixing zone is then performed to obtain limiting permissible concentration for the who waste that recognizes the dominant role neutralization in reducing concentration and to icity of the acidic constituent in the zone. T method, which is demonstrated for a by-produ hydrochloric acid with the copepod Acartia ton as the bioassay organism, can be modified for us with alkaline wastes. (Katz)

OXICITY, ACCUMULATION, AND RELEASE OF THREE POLYCHLORINATED APHTHALENES (HALOWAX 1000, 1013, AND 099) IN POSTLARVAL AND ADULT GRASS HRIMP, PALAEMONETES PUGIO,
exas A and M Univ., College Station. Dept. of iology.
. A. Green, Jr., and J. M. Neff.
ulletin of Environmental Contamination and oxicology, Vol. 17, No. 4, p. 399-407, April 1977. tab., 2 fig., 13 ref.

escriptors: *Lethal limit, *Toxicity, Absorption, *Bioassay, *Organic compounds, Chlorination, *Water pollution effects, *Shrimp, Mortality, *Growth stages, Laboratory tests, ath of pollutants, Metabolism, Larvae, Invertebrates.
dentifiers: *Polychlorinated naphthalenes, Halowax, *Bioconcentration, Palaemonetes ugio, *Grass shrimp.

dult and postlarval grass shrimp, Palaemonetes ugio, were exposed to Halowax 1000, 1013, and 099, three polychlorinated naphthalenes. In toxicity tests, Halowax 1099 (trichloro-and etrachloronaphthalenes) was more toxic to grass hrimp than Halowax 1000 (monochoro and ichloronaphthalene). Postlarvae were less olerant than adults to Halowax 1099 and 1013, but vere more tolerant to Halowax 1000 than the dults. Halowax 1099 was concentrated in the tissues of adult grass shrimp to a level 257 times greater than the exposure concentration, whereas Halowax 1013 and 1000 reached magnification factors of 187x and 63x, respectively. The degree to which the different compounds were accumulated corresponded to their relative degree of toxicity. This could be directly related to the relative ability of the shrimp to metabolize or excrete PCN's of different chlorine content. (Katz)

THE EFFECT OF TWO PESTICIDES, MIEDZIAN 50 AND GESAGARD 50, ON THE DEVELOPMENT OF TADPOLES OF RANA TEMPORARIA,
Polish Academy of Sciences, Krakow. Dept. of Experimental Zoology.
M. Jordan, K. Rzehak, and A. Maryanska.
Bulletin of Environmental Contamination and Toxicology, Vol. 17, No. 3, p. 349-354, 1977. 4 fig., 10 ref.

Descriptors: Animal physiology, *Water pollution effects, *Growth stages, Animal growth, *Immature growth stage, *Frogs, *Toads, Environmental effects, Animal pathology, *Toxicity, *Pesticides, Amphibians, Aquatic animals, Mode of action, Copper compounds, Agricultural chemicals, Pesticide residues.
Identifiers: *Miedzian 50, *Gesagard 50, Rana temporaria, *Tadpoles.

Tadpoles of the frog, Rana temporaria, in two developmental stages were subjected to the action of aqueous suspensions of two pesticides-Miedzian 50 (basic cupric chloride) and Gesagard 50. The changes caused these substances pertain chiefly to the alimentary canal, brain, and muscles, as shown by microscopic inspection of cross-sections, and are connected with the developmental stage of the animals. Miedzian 50 caused a partial cytolysis in the cells of the intestinal epithelium and the parenchyma of the liver. Gesagard 50 was more toxic. Strong degenerative changes were observed in the alimentary canal and the brain. Developmental disorders were also observed, consisting of a partial growth inhibition and a retardation of the process of completion of the operculum as compared with control animals. (Katz)

THE ACCUMULATION OF POLYBOMINATED BIPHENYLS BY FISH,
Fisheries and Marine Service, St. Andrews (New Brunswick). Biological Station.
V. Zitko.
Bulletin of Environmental Contamination and Toxicology, Vol 17, No 3, p 285-292, 1977. 1 fig, 5 tab, 11 ref.

Descriptors: *Bromine, *Halogenated pesticides, *Bioassay, *Absorption, *Salmonids, *Pesticide residues, Aroclor, Chlorinated hydrocarbon pesticides, Polychlorinated biphenyls, Path of pollutants, Laboratory tests, Atlantic salmon, Persistence, Analytical techniques.
Identifiers: *Polybrominated biphenyls, BP-6, OB.

The accumulation of commercial polybrominated biphenyls (PBBs), BP-6 (Michigan Chemical Corporation) and OB (The Dow Chemical Company), from water and from food by juvenile Atlantic Salmon (Salmo salar) was determined and compared with that of Aroclo 1254. Only bromobiphenyls with six or fewer bromine atoms were accumulated from water by the fish. When administered in food, more brominated biphenyls were taken up as well. Bromobiphenyls with up to four bromine atoms resemble corresponding chlorobiphenyls, while the more substituted bromobiphenyls are less accumulated from water than corresponding PCBs. The accumulation of these bromobiphenyls from food is higher or equal to that of Aroclor 1254. The highly substituted bromobiphenyls are debrominated in the fish, a reaction which may have toxicological consequences not encountered with PCBs. (Katz)
W77-08777

EUTROPHICATION OF AN IMPOUNDED ESTUARINE LAGOON,
Tasmania Univ., Hobart (Australia). Dept. of Zoology.
R. E. Buttermore.
Marine Pollution Bulletin, Vol 8, No 1, p 13-15, January 1977. 4 fig, 15 ref.

Descriptors: *Sewage, *Water pollution effects, *Lagoons, *Estuaries, *Eutrophication, *Impoundments, *Odor, *Odor-producing algae, *Decomposing organic matter, *Water quality, *Mussels, Aquatic productivity, Biological communities, Mollusks, Fishkills, Crustaceans, Heavy metals, Agricultural runoff, *Australia.
Identifiers: *Estuarine lagoon, *Tasmania.

A small lagoon to the east of Hobart is cut off from a larger body of tidal salt water by a causeway, allowing only a limited tidal interchange. Primary treated effluent from a small township is discharged into the lagoon. Causes for noxious odors emanating from the lagoon were investigated. It was found that the effluent, combined with agricultural runoff, has accelerated eutrophication. Wide variations in temperature and salinity occur. Decomposing algal mats account for most of the odors, while rooted aquatics and molluscs appear to play only a small part. Proposed remedies will be costly and still might not achieve their objectives. (Katz)

AVOIDANCE OF BLEACHED KRAFT PULPMILL EFFLUENT BY PINFISH (LAGODON RHOMBOIDES) AND GULF KILLIFISH (FUNDULUS GRANDIS),
Florida State Univ., Tallahassee. Dept. of Biological Sciences.
F. G. Lewis, III, and R. J. Livingston.
Journal of the Fisheries Research Board of Canada, Vol 34, p 568-570, 1977. 1 fig, 12 ref.

Descriptors: *Fish behavior, Fish physiology, *Water pollution effects, Laboratory tests, *Industrial wastes, *Pulp wastes, *Pulp and paper industries, Methodology, Laboratory technique, *Killifishes, Statistical methods.
Identifiers: *Bleached kraft pulpmill effluent, *Gradient trough, *Avoidance, Gulf killifish, Steep gradient trough, *Avoidance response, *Pinfish.

Avoidance of bleached kraft pulpmill effluent (BKME) by fish was investigated in a steep gradient trough. No significant difference was found between the responses of the two species. No avoidance was recorded at 0.01% BKEM, while both species displayed a significant, yet low avoidance at 0.1% BKME. A marked avoidance was observed for both species at 1.0% and 10.0% BKME. In both species the threshold avoidance level was estimated to be 0.06% BKME. (Katz)

Acta Ichthyologica et Piscatoria, Vol 5, No 1, p 51-57, 1975. 1 tab, 2 fig, 16 ref.

Descriptors: *Mercury, *Absorption, *Heavy metals, *Path of pollutants, *Eels, *Herrings, Public health, Water pollution control, Industrial wastes, Marine fish, Biochemistry, Physiology.
Identifiers: Bioconcentration, Tissue analysis, Muscle tissue, *Cod, Gadus, Clupea, Anguilla,

Lucioperca, *Poland, Pomeranian Gulf(Poland), Szezecin Firth(Poland).

Determinations were made on mercury content in muscles of cod and herring from Pomeranian Gulf and of pikeperch and eel from Szczecin Firth. Additionally, the level of Hg was measured in liver and kidneys of selected cod and herring. Mercury content in muscle tissues ranged from 0.00 to 0.37 mg/kg with the highest concentrations found in two eels and two pikeperch, at 0.25, 0.37, 0.35 and 0.21 mg/kg, respectively. The highest average mercury content was 0.11 mg/kg found in eel muscle tissue. Mercury accumulation in cod and herring livers was higher than in muscle tissues. Mercury accumulation in herring kidney was 1.5 times higher than in muscles. (Katz)
W77-08781

THE INFLUENCE OF SOME POLLUTANTS ON THE SURVIVAL OF EGGS AND LARVAE OF TWO SPECIES OF FLATFISH, LIMANDA YOKOHAMAE AND PARALICHTYS OLIVACEUS, (IN JAPANESE),
Y. Yasunaga.
Bulletin of the Tokai Regional Fisheries Research Laboratory, No 86, p 81-112, 1976. 5 tab, 15 fig, 17 ref.

Descriptors: *Larvae, Pollutants, *Toxicity, *Water pollution effects, *Mortality, *Fish eggs, *Lethal limit, *Mercury, *Bioassay, *Phosphates, *Sulfates, Ammonium salts, Hydrogen ion concentration, Growth stages, Surfactants, Phenols, Nitrates.
Identifiers: Limanda, Paralichtys, *Flatfish, Japan.

Laboratory tests were conducted to determine the toxicity and effects of various pollutants on eggs and larvae of flatfish species, Limanda yokohamae and Paralichtys olibaceus. In addition, relationship between survival and hydrogen ion concentration was examined. The TLM values for phosphate ion, nitrate ion and phenol ranged between 100-1, 100 ppm. Ammonia ion, sulphate, mercury and anionic surface active agent were found to be fairly toxic with TLM values ranging between 0.05-0.5 ppm. Nonionic surface active agent was mildly toxic to larvae but it caused a high rate of deformity in hatching even at low concentrations of 10-15 ppm for L. yokohamae and of 0.05 ppm for P. olivaceus. (Katz)
W77-08782

POLYCHLORINATED BIPHENYLS IN ADULT MAYFLIES (HEXAGENIA BILINEATA) FROM THE UPPER MISSISSIPPI RIVER,
Fish and Wildlife Service La. Crosse, Wis. Fish Pesticide Research Unit.
W. L. Mauck, and L. E. Olson.
Bulletin of Environmental Contamination and Toxicology, Vol 17, No 4, p 387-390, April 1977. 1 fig, 10 ref.

Descriptors: *Polychlorinated biphenyls, *Aroclor, *Path of pollutants, *Food chains, *Mississippi River, *Mayflies, *Pesticide residues, *Absorption, *Bioindicators, Invertebrates, Aquatic insects, Food webs, Pollutant identification, Public health, Fish food organisms.

The burrowing mayfly (Hexagenia bilineata), an important natural fish food in the upper Mississippi River, was collected from 14 sample sites to determine levels of the PCB, Aroclor 1254. Adult mayflies from all stations contained significant residues of Aroclor 1254 with the highest concentrations (about 2.5 micrograms per gram, whole body weight) in mayflies collected from Lake Pepin. Similar trends were found in fish collected from the same stations, sugesting the contribution of mayflies to PCB levels in fish by way of the food chain. The adult mayfly may be a useful indicator of chemical residue trends in the Upper Mississippi because of its abundance and ease of collection. (Katz)

ACID MINE DRAINAGE (AMD) AND ITS IMPACT ON A SMALL VIRGINIA STREAM,
Virginia Polytechnic Inst. State Univ., Blacksburg. Dept. of Civil Engineering.
R. C. Hoehn, and D. R. Sizemore.
Water Resources Bulletin, Vol 13, No 1, p 153-160, February 1977. 2 fig, 15 ref.

Descriptors: *Water pollution sources, *Mortality, *Hydrogen ion concentration, *Acid mine water, *Mine drainage, *Mine wastes, *Benthic fauna, *Iron compounds, *Bioassay, Fish, *Snails, *Toxicity, *Virginia, Acid water, Water pollution effects, Environmental effects, Water quality, Chemical properties, Iron, Pollutants.
Identifiers: *Chestnut Creek(Virginia).

A study was conducted to chemically characterize three AMD streams entering Chestnut Creek in southwestern Virginia and to assess the biological and chemical alterations in the creek. Over a six mile reach, the benthic macroinvertebrate population was reduced to zero, the natural low alkalinity (25 mg/1) of the stream was reduced to less than 5 mg/1, and the pH was reduced from 7.2 to 6.3. Increased concentration of iron from less than 0.01 mg/1 to more than 4.0 mg/1 was accompanied by the deposition of a coating of iron hydroxide up to 0.25 inches thick in the stream bed, which is probably responsible for the absence of benthic macroinvertebrates. In situ bioassays with bluegill sunfish and one snail species showed that the creek water, after confluence with AMD streams, was not toxic in 192 hours to fish, and snails survived 96 hours before they began to die. Undiluted AMD was highly toxic. (Katz)

Wisconsin Dept. of Natural Resources, Woodruff.
S. L. Serns.
Water Resources Bulletin, Vol. 13, No. 1, p. 71-80, February 1977. 5 tab., 15 ref.

Descriptors: *Sunfishes, *Aquatic plants, *Fish reproduction, *Growth rates, *Herbicides, *Growth stages, Path of pollutants, Pesticide residues, *Aquatic weed control, Pesticides, Absorption, Mortality.
Identifiers: *Endothall, Myriophyllum, Ceratophyllum, Potamogeton, Anacharis.

A 0.31-ha pond was treated with 5.0 mg/1 dipotassium endothall and the effects of this treatment on the rooted aquatics, on bluegill reproduction, survival, and growth, and on the buildup of endothall residues in bluegill flesh was investigated. The treatment eliminated Myriophyllum exalbescens, Ceratophyllum demersum, Potamogeton crispus, and Anacharis canadenis during the first season, however, all but C. demersum became reestablished the following year. Little endothall was incorporated into edible bluegill flesh. The dipotassium endothall did not affect the number of young-of-the-year bluegills produced by the original adult stocking during the year of treatment and the year following treatment and did not affect the reproduction of first generation bluegills. The survival of adult and first generation bluegills was not affected by the herbicide. Bluegills were slower growing in the treatment than the control pond, when similar densities were present in each pond. It is not known whether this was due to some unknown effect of the dipotassium endothall or to other factors. (Katz)

EFFECTS OF SUBLETHAL CONCENTRATIONS OF THE HERBICIDE ATRAZIN ON GROWTH AND REPRODUCTION OF DAPHNI PULEX,
Freiburg Univ. (West Germany). Limnologische Institut.
U. Schober, and W. Lampert.
Bulletin of Environmental Contamination an Toxicology, Vol. 17, No. 3, p. 269-277, 1977. 5 fig 4 tab., 7 ref.

Descriptors: *Bioassay, *Bioindicators, *Wate pollution effects, Environmental effect *Mortality, *Reproduction, *Herbicides, *Growt rates, Longevity, Laboratory tests, Methodology *Daphnia zooplankton.
Identifiers: *Atrazin, *Sublethal effects.

Young Daphnia pulex were exposed to the herb cide Atrazin, an inhibitor of photosynthesis, in e periments designed to provide information c changes in reproduction and growth at subleth doses. In 28 day tests, reproduction was signif cantly affected at 1 ppm. With increasing Atrazi concentrations growth was reduced as evidence by mean length and carbon concentration. Th greatest reduction (53.7%) occurred between 1 an 5 mg Atrazin/l. Experiments lasting 70 days, th approximate life span of Daphnia, showed no e fect on longevity. Various problems associate with testing for sublethal effects of pollutants a discussed.
W77-08786

CONCENTRATIONS OF PCBS, DIELDRIN AN DDT RESIDUES IN MARINE ANIMALS FRO LIVERPOOL BAY,
Liverpool Univ. (England). Dept. of Oceano raphy.
J. P. Riley, and S. Wahby.
Marine Pollution Bulletin, Vol. 8, No. 1, p. 9-1 January 1977. 2 tab., 11 ref.

Descriptors: *Polychlorinated biphenyl *Dieldrin, *DDT, *Absorption, *Sewage sludg *Sewage disposal, *Mollusks, *Benthic faun *Crustaceans, *Pesticide residues, *Marine fis Chlorinated hydrocarbon pesticides, Path of poll tants, Bays.
Identifiers: *Liverpool Bay(England *Bioaccumulation, Irish Sea.

The levels of DDT residues, dieldrin and PC have been determined in the tissues of fifteen sp cies of marine animals from the Liverpool Ba area of the Irish Sea. In general, the concentr tions of these compounds are lower than those r ported earlier for fish from other British insho areas, depsite the fact that the Bay is subject pollution, not only from the River Mersey, b also from extensive sewage sludge dumping. Th level of the compounds in the sampled organism were below those which present a hazard to ma These low levels may reflect recent controls on th use of these compounds.
W77-08788

SOME EFFECTS OF OIL DISPERSANTS O THE FEEDING BEHAVIOUR OF THE BROW SHRIMP, CRANGON CRANGON,
Southampton Univ. (England). Dept. of Oceano raphy.
G. W. Evans, M. Lyes, and A. P. M. Lockwood.
Marine Behaviour and Physiology, Vol. 4, p. 17 181, 1977 4 fig, 12 ref.

Descriptors: *Oil, *Oil pollution, *Water pollutio effects, *Shrimp, Marine animals, Commerci shellfish, *Animal behaviour, Animal physiolog Feeding rates, Bioassay, Laboratory tests, *O spills.
Identifiers: Brown shrimp, Crangon, *Oil dispe sants, *Tween 80, *BP 1100X, *Slickgone LT Food detection, Food consumption.

Concentrations in the range 1 ppm - 100 ppm Tween 80, BP 1100X and Slickgone LT2 in s water are shown to decrease both the food co

sumption of the shrimp, Crangon crangon, and the ability of the animal to select the arm of a Y-maze which contains food extract. The ability to locate food is largely recovered within four hours of return of the animals to clean sea water after prior exposure to 10 ppm Tween 80, 10 ppm BP 1100X or 10 ppm Slickgone LT2. (Katz)
W77-08790

EFFECTS OF A PARASITE, EUBOTHRIUM SALVELINI (CESTODA: PSEUDOPHYLLIDEA), ON THE RESISTANCE OF JUVENILE SOCKEYE SALMON, ONCORHYNCHUS NERKA, TO ZINC,
Fisheries and Marine Service, Nanimo (British Columbia). Biological Station.
Journal of the Fisheries Research Board of Canada, Vol. 34, p. 706-709, 1977. 1 fig, 12 ref.

Descriptors: *Zinc, *Metals, *Fish diseases, Water pollution effects, *Sockeye salmon, Toxicity, Salmon, Freshwater fish, Laboratory tests, Lakes, Bioassay, *Fish parasites.
Identifiers: British Columbia, Babine Lake, *Tapeworm, Eubothrium, *Biological stressors, Intestinal cestodes.

Most research to date on the tolerance of natural populations to physical and chemical stressors appears to have overlooked that parasites may themselves be stressors, and that they may be capable of modifying the resistance of the host to other applied stressors. Sockeye salmon (Oncorhynchus nerka) smolts trapped at the outlet of Babine Lake, central British Columbia, were subjected to 1 mg/l dissolved zinc under laboratory conditions. Smolts infected with the intestinal cestode Eubothrium salvelini proved to be significantly more susceptible to zinc than were noninfected smolts. We recommend that future investigations of environmental effects, especially on wild populations, include consideration of the state of parasitism of the test organisms. (Katz)

ALGAL UPTAKE OF COPPER FROM COMPOUNDS AND ITS EFFECT ON SALT METABOLISM IN ALGAE,
Moscow State Univ. (USSR).
V. G. Khobot'yev, V. I. Kapkov, Ye. G. Rukhadze, N. V. Turunina, and N. A. Shidlovskaya.
Hydrobiological Journal, Vol. 12, No. 1, p. 29-34, 1976 2 tab., 1 fig., 7 ref.

Descriptors: *Copper, *Metals, Algae, *Phytoplankton, Biochemistry, Physiology, *Water pollution effects, Path of pollutants, Toxicity, Bioassay, Potassium, Herbicides, *Algicides, *Absorption.
Identifiers: *Algal copper uptake, Copper compounds, *Inorganic copper, Salt metabolism, *Biocides, Protococcal algae, Toxicity mechanism.

The dynamics of algal copper uptake from media containing various copper concentrations was studied. A direct relationship was found between the copper accumulation by the cells and algicidal action of a given compound. The high biocidal activity of copper complexes is due to the ability of the cells to take up large quantities of copper from compounds with a coordination bond between the metal and the ligand. Toxic (0.78 x 10 to the 5th power to 7.8 x 10 to the 5th power M) concentrations of copper complexes disturb salt metabolism in algal cells due to copper accumulation or potassium loss. If the concentration of a copper compound with a coordination bond is 7.8 x 10 to the 5th power M, the content of potassium in the algal cells decreases by 80% within 30 to 60 min. (Katz)

ECOLOGY OF TOXICITY IN MARINE SPONGES,
Universidad Nacional Autonoma de Mexico, Mexico City. Centro de Ciencias del Mar y Limnologia.
G. Green.
Marine Biology, Vol. 40, p. 207-215, 1977 3 tab., 21 ref.

Descriptors: *Toxicity, *Marine animals, North America, Washington, Mexico, Bioassay, *Invertebrates, Geographical regions, Latitudinal studies, Methodology, California, Fish food organisms, Fish diets, Fish diseases, *Fish repellents, *Fish toxins, Marine fish, Fish behavior.
Identifiers: Force feeding experiments, *Sponges, *Sponge species, San Juan Island, Santa Catalina Island, *Toxic sponge extract.

An investigation of the ecology of toxicity in marine sponges from different latitudes on the North American continent was made. Results indicated that toxicity in sponges increased with decreasing latitude. Three of the 34 species (9%) of sponges from San Juan Island, Washington, USA (48oN), were toxic to fishes. Nine of the 44 species (20%) of sponges from Santa Catalina Island, California, USA (33oN), were toxic. Seven of the 11 species (64%) of sponges from Zihuatanejo Bay, Guerrero, Mexico (17oN), were toxic. Twenty-seven of the 36 species (75%) of sponges from La Bianquilla, Veracruz, Mexico (19oN), were toxic. Most of these toxic sponges are openly exposed to fishes. The most common exposed sponges proved to be highly toxic to fishes. Force-feeding experiments conducted with wrasses demonstrated the effectiveness of the toxin of sponges. A hypothesis is proposed which explains the relationship between species diversity of fishes and sponge toxicity with latitude. (Katz)
W77-08793

EFFECT OF THE WATER-SOLUBLE FRACTIONS OF CRUDE, REFINED AND WASTE OILS ON THE EMBRYONIC AND LARVAL STAGES OF THE QUAHOG CLAM MERCENARIA SP.,
Florida State Univ., Tallahassee. Dept. of Oceanography.
C. J. Byrne, and J. A. Calder.
Marine Biology, Vol. 40, p. 225-231, 1977 3 tab., 31 ref.

Descriptors: *Oil wastes, Spills, *Toxicity, Bioassay, Laboratory tests, *Mollusks, *Clams, Marine animals, Embryonic growth stage, *Larvae, Larval growth stage, Water pollution effects, Water pollution sources, Water quality, Methodology.
Identifiers: *Quahog clam, Mercenaria sp., *Crude oil, *Refined oil, *Waste oils, *Water-soluble fractions, Kuwait crude, Southern Louisiana Crude, Florida Jay Crude, LC50, *Used motor oil.

The embryonic and larval stages of the quahog clam Mercenaria sp. were exposed to the water-soluble fractions (WSFs) of 6 oils and the effects on survival and growth rate of the various stages were noted. Kuwait crude oil was the least toxic on initial exposure to both stages, having LC50 values in excess of 10 ppm after continuous exposure to the WSF for up to 6 days. However, at 10 days, Kuwait was slightly more toxic than Southern Louisiana crude oil, with both oils having LC50 values near 2 ppm. Florida Jay crude oil was much more toxic, with an LC50 of less than 1 ppm at 48 h and less than 0.2 ppm at 10 days. Two refined oils, No. 2 fuel oil and Bunker 'C', had LC50 values of 1 to 2 ppm after 48 h, while used crankcase motor oil, the most toxic oil tested, had LC50 values of 0.10 ppm or less at all exposure times. Larvae surviving exposure to water-soluble fractions of the various oils often grew at slower rates than the controls. (Katz)

INCORPORATION OF BENZATHRONE INTO THE NUCLEI OF GYRODINIUM SP. AND THE HEREDITY OF CONSEQUENT MITOTIC DELAYS,
Kyushu Univ., Fukuoka (Japan). Lab. of Fisheries and Chemistry.
S. Ishio, J. C. Chen, and N. Ohba.
Bulletin of the Japanese Society of Scientific Fisheries, Vol. 43, No. 3, p. 289-299, 1977 3 tab., 1 fig., 19 ref.

Descriptors: *Organic compounds, Organic waste, *Oil pollution, *Marine algae, *Phytoplankton, Path of pollutants, *Water pollution effects, Biochemistry, Methodology, *Genetics, Nutrients, Herbicides.
Identifiers: *Gyrodinium, Benzathrone-3H, *Bioconcentration, Gyrodinium nuclei, *Mitotic delays, Heredity.

Benzathrone added to ASP2NTA medium was incorporated in a short period, mainly into the thecae and the crude nuclei of Gyrodinium sp. The benzathrone incorporated into purified nuclei was less, but its concentration amounted to 800 times as large as the initial 1 ppm concentration of the medium. Benzathrone in purified nuclei was extremely hard to remove and was presumed to intercalate between DNA base pairs. Since Gyrodinium sp. was separated from the medium containing benzathrone continued to propagate, showing mitotic delays over three to five generations at least in the normal medium, the mitotic delay caused by benzathrone was concluded to be of a hereditary nature. (Katz)

METHOXYCHLOR RESIDUE STUDIES IN CAGED AND WILD FISH FROM THE ATHABASCA RIVER, ALBERTA, FOLLOWING A SINGLE APPLICATION OF BLACKFLY LARVICIDE,
Fisheries and Marine Service, Winnipeg (Manitoba). Freshwater Inst.
W. L. Lockhart, D. A. Metner, and J. Solomon.
Journal of the Fisheries Research Board of Canada, Vol. 34, p. 626-632, 1977 3 tab., 18 ref.

Descriptors: *On-site-investigation, *Insecticides, *Chlorinated hydrocarbon pesticides, Aquatic insects, Laboratory tests, Rainbow trout, Freshwater fish, Suckers, Minnows, *Monitoring, Water pollution effects, *Toxicity, Bioassay, *Larvicide, *Pesticide residues, Pollutant identification.
Identifiers: *Methoxychlor, *Residue studies, Athabasca River, Alberta, *Blackfly larvicide, Catostomus, Hybopsis, Tissue residue, Pesticide residues.

On June 4, 1974, the Athabasca River was treated with methoxychlor for control of blackfly larvae. Pesticide was introduced into the water in a manner calculated to generate a 15-min pulse of treated water containing 300 microgram methoxychlor/l. A preliminary experiment with rainbow trout (Salmo gairdneri) indicated that liver of kidney residues of methoxychlor would be suitable for monitoring likely times and places to expect toxic effects on fish in the river. Fish (Salmo gairdneri, Catostomus commersoni, C. Catostomus, and Hybopsis gracilis) were caged in order to observe residues and mortality. Caged fish were not killed by methoxychlor but they contained lower liver residues than wild fish of the same species captured near cages. Contaminated wild fish were found upstream of the treatment site after treatment. Residues were below detection limits by

June 16. Residue measurements suggested that the most likely times to expect fish poisoning were the 2 wk following treatment and that the most likely places were those river areas extending a few kilometers in both directions from the point of application. Evidence of fish movements and low pesticide residues in caged individuals reduced confidence in residue methods as monitoring tools. (Katz)

OPTIMAL TEMPERATURE FOR GROWTH OF JUVENILE BLUEGILLS,
Environmental Research Lab-Duluth, Minn.
A. E. Lemke.
The Progressive Fish Culturist, Vol. 39, No. 2, p. 55-57, April 1977 1 tab., 14 ref.

Descriptors: Freshwater fish, *Sunfishes, *Water temperature, *Thermal stress, Laboratory tests, Methodology, Juvenile fish, Bioassay, Water quality, *Growth rates, *Aquiculture, Fish physiology, Statistical methods.
Identifiers: *Constant temperature test, *Specific growth rate.

Juvenile bluegills, Lepomis macrochirus (initial weight, 1.8-8.0 g) were individually marked and fed to excess during a 30-day constant temperature test; day length was 16 h. Fish were tested at temperature intervals of 2 deg. from 20 to 36 C. The highest specific growth rate occurred at 30 C (2.35%/day); however, growth rates of only the groups held at 20 C and 36 C were statistically different from the rate for the group held at 30 C. (Katz)

BEHAVIORAL STUDIES ON CHEMORECEPTION IN BALANUS HAMERI,
University Coll. of North Wales, Menai Bridge. Marine Science Labs.

Descriptors: *Animal behaviour, Animal physiology, Animal populations, Benthos, *Marine animals, *Feeding rates, Feeds, Bioassay, Biochemistry, Methodology, Laboratory tests, *Hydrogen ion concentration, Amino acids.
Identifiers: *Barnacles, Balanus, Amino acids, *Feeding behaviour, Threshold, 1-glutamic acid, Glycine, *Feed response, *Algae extracellular products, *Chemoreception.

Solutions of amino-acid and some related compounds were found to release feeding behaviour in Balanus hameri. The lowest threshold was to a-glutamic acid (2.3 x 10 to the 5th power M) followed by glycine (4.5 x 10 to 5th power M) followed by glycine (4.5 x 10 to the 4th power M). The experiments suggest that the animals can distinguish the isomers of glutamic acid. Strong feeding responses were also obtained from the Iripeptide, reduced glutathione (5 x 10 to the 4th power M). Solutions of glycollic acid, an extracellular product of some algae, were only weakly stimulatory. Acidic and alkaline solutions in the ranges pH 1-3.5 and 9.5-13 also evoked apparent feeding responses, but the pH of the solution had no observable effect in the range of 5-9.5. (Katz)

PHYSIOLOGICAL AND BEHAVIORAL REACTIONS OF FISHES TO TEMPERATURE CHANGE,
Yale Univ., New Haven. School of Medicine.
L. I. Crawshaw.
Journal of the Fisheries Research Board of Canada, Vol 34, p 730-734, 1977. 2 fig, 45 ref.

Descriptors: Fish, *Fish physiology, Fish behavior, *Themal pollution, *Water pollution effects, *Thermal power, Thermal stress, Thermal water, Temperature, Trout, Salmon.
Identifiers: *Temperature change, *Behavioral responses, *Physiological responses, Temperature regulation, *Physiological temperature optima, Acute effects, Peripheral temperature change, *Thermal exchange, Respiratory homeostasis, Thermal acclimation.

Teleost fishes possess a central nervous system thermoregulatory mechanism remarkably similar to that of other vertebrates. Inputs from peripheral and anterior brainstem thermosensitive elements are integrated to effect appropriate thermoregulatory responses. The integrated output signal from the thermoregulatory center also appears to provide an input to the respiratory system. Short-term deviations from a given temperature alter respiratory requirements, produce acid-base imbalance, and cause disturbances in fluid-electrolyte regulation. Acclimation to a given temperature involves changes that counteract these disturbances. (Katz)

EFFECT OF HOT EFFLUENT DISCHARGE FROM THE KONAKOVO POWER PLANT ON THE GROWTH OF BREAM IN IVAN'KOVO RESERVOIR,
Vserossiiskii Nauchno-Issledovatelskii Institut Prudovogo Rybnogo Khozyaistva, Moscow (USSR).
G. B. Sappo.
Hydrobiological Journal, Vol 11, No 6, p 43-47, 1975. 3 tab, 2 fig, 14 ref.

Descriptors: *Heated water, *Environmental effects, *Growth rate, *Water pollution effects, *Water temperature, *Freshwater fish, *Biomass, *Metabolism, Temperature, Fish reproduction, Powerplants, *Thermal pollution, Thermal water, Populations, Adaptation, Benthos, Feeding rates.
Identifiers: *Bream, *Ivan'kovo Reservoir(USSR).

The effect of a heated water effluent on the growth rate of bream in the Ivan'kovo Reservoir was determined by sampling fish from control stations, from a station strongly affected by the heated water and from a station slightly affected by the heated effluent. The most rapid growth rate was found in fish from the area slightly affected by heated water, followed by fish from the control area. The fish with the slowest growth rate came from the area strongly affected by heated water. Even though this group of fish showed a higher feeding rate and the biomass of benthos was greater, the increased metabolic rate due to high temperatures were not satisfied by the food intake. Bream in areas with higher water temperatures were found to mature at smaller sizes. (Katz)

THE EFFECT OF WARM EFFLUENT FROM THE NOVOROSSIYSK THERMAL POWER PLAN ON ZOOPLANKTON,
Kuban State Univ., Novorossisk (USSR). Marine Biology Research Station.
L. I. Goryaynova.
Hydrobiological Journal, Vol 11, No 6, p 19-23, 1975. 2 tab, 9 ref.

Descriptors: Populations, *Biomass, *Zooplankton, *Heated water, *Seasonal, *Water temperature, Water pollution effects, *Larvae, *Copepods, Environmental effects, *Thermal pollution, Bays, Powerplants, Temperature, Invertebrates, Plankton.
Identifiers: *Black Sea, *Species composition, *Novorossiysk Bay(Black Sea).

Novorossiysk Bay in the Black Sea was the site of an investigation to determine the yearly pattern of species composition and distribution of zooplankton in a thermal powerplant discharge. The mean annual temperature in the area near the discharge of the heated effluent was 1.30C higher than at the control station. During the winter season the species composition of the zooplankton in the effluent zone was more diverse that at the control station. In the spring 17 species of zooplankton were found in the effected areas as compared to 11 species in the control area. In the summer and fall more species were found in control areas because 'cold-loving' species avoided warmer water. A higher concentration of copepod nauplii and larvae of bottom organisms was observed in the warm-water zone. The average annual abundance and biomass of the zooplankton in the warm water zone was almost double those at the control station. (Katz)

Available from the National Technical Information Service, Springfield, VA 22161 as PB-268 859, Price codes: A03 in paper copy, A01 in microfiche. Completion Report, Rutgers University, Water Resources Research Institute, April 1977. 41 p, 4 tab, 16 fig, 20 ref. OWRT A-053-NJ(1), 14-34-0001-7063.

Descriptors: *Nitrification, *Waste assimilative capacity, Water quality standards, *New Jersey, Evaluation, Oxygen demand, Nitrogen cycle, Sampling, Nutrients, Ammonium.
Identifiers: *Nitrifying bacteria, *Nitrogenous biochemical oxygen demand, *Passaic River(NJ), Microbial ecology, Substrate ammonium.

In connection with waste load allocation, it is often controversial whether the nitrogenous oxygen demand measured in the effluent is exerted in the receiving stream. The basis of this controversy is outlined through the use of historic data from the Passaic River, and a consideration of the nitrogen cycle. The experimentation consisted of following the course of nitrification in Passaic River water samples through the dtermination of nitrogen species, and of enumerations of nitrifying bacteria. Based on the course of nitrification, substrate ammonium appears to have been present in non-growth limiting concentrarion over most of the Passaic main stem. Other nutrients were adequate for nitrification, and there was no evidence of inhibitive effects. These findings lead to an expectation of a nitrifier population expansion with downstream travel, which is not observed. This discrepency is ascribed to the removal of cells from the water column through settling. The results are discussed in relation to the controversy.

DENSITY AND DISTRIBUTION OF BENTHOS IN LAKE KEOWEE, SOUTH CAROLINA,
Clemson Univ., S.C. Dept. of Zoology.
G. L. Ryals, Jr.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-268 897, Price codes: A05 in paper copy, A01 in microfiche. Ph.D. Dissertation, December 1975. 78 p, 38 fig, 6 tab, 66 ref. OWRT A-027-SC(1).

Descriptors: *Benthos, *Heated water, *Diptera, Water temperature, Dissolved oxygen,

*Distribution, Density, Lakes, *South Carolina, *Invertebrates, Impoundments, Depth, Seasonal.
Identifiers: *Lake Keowee(SC).

Density and distribution of benthic macroinvertebrates were studied from August 1971, to August 1973, in Lake Keowee, a large newly formed impoundment in northwestern South Carolina scheduled to receive discharges of heated water. The effects of depth, station location, and season on density and taxonomic composition of benthos were examined. Total numbers of benthos varied inversely with depth. Abundance was affected by location of sampling sites within the lake, being lower in the discharge canal and proximal areas than in the intake canal and control areas. Station differences were probably related to variations in the particle size distribution and organic content of the substrate. The differences among substrates resulted from preimpoundment construction activities in the discharge area. Total density generally had 3 peaks, in the spring, summer, and autumn. The dipterous families Chironomidae and Chaoboridae were the major taxa. Chironomids were most abundant at 5 m, and chaoborids were most numerous at 20 m. Temperature, dissolved oxygen, and other water quality parameters did not vary significantly among the stations.

EFFECTS OF HYPOLIMNETIC AERATION ON NITROGEN AND PHOSPHORUS IN A EUTROPHIC LAKE,
Adelphi Univ., Garden City, N.Y.; and Adelphi Univ., Oakdale, N.Y. Inst. of Marine Science.
M. H. Garrell, J. C. Confer, D. Kirschner, and A. W. Fast.
Water Resources Research, Vol. 13, No. 2, p 343-347, April 1977. 3 fig, 4 tab, 11 ref.

Descriptors: *Aeration, *Water pollution control, *Oxygenation, *Lakes, *New York, Eutrophication, Dissolved oxygen, Nutrients, Water treatment, Hypolimnion, Oxygen, Nitrogen, Stratification, Organic loading, Surface waters, Water quality, Limnology.
Identifiers: *Lake Waccabuc(NY), *Lake Oscaleta(NY).

The effects of hypolimnetic aeration on total P, NO3-N, and NH4-N in eutrophic Lake Waccabuc (New York) were described. The lake was aerated for two consecutive summers (1973 and 1974) by using the system described in an earlier paper. Although reductions in hypolimnetic P concentrations appeared in the first summer, the reductions failed to reappear during the second summer. NH4-N and NO3-N concentrations were compared with those in an unaerated control lake. Lake Oscaleta (New York). Very slight changes in relative hypolimnetic NH4-N concentrations and corresponding increases in hypolimnetic N 3-N concentrations were seen. The overall results suggested that the aerated lake is subjected to substantial external loading, which may mask aeration effects on the internal nutrient cycles. (Sims-ISWS)

EFFECTS OF TEMPERATURE AND KELTHANE ON GRASS SHRIMP,
California Univ., Davis. Water Science and Engineering Section.
S. Khorram, and A. W. Knight.
Journal of the Environmental Engineering Division, Proceedings of the American Society of Civil Engineers, Vol 102, No EE5, Proceedings paper No 12475, p 1043-1053, October 1976. 2 fig, 6 tab, 25 ref. (Calif. Water Resources Ctr., Project W243).

Descriptors: *Water pollution effects, *Continuous flow, Model studies, *Bioassay, *Insecticides, *Shrimp, Temperature, Aquatic animals, Pollutant identification.
Identifiers: *Organic chlorides, Keloids.

Proportional continuous-flow bioassay tests were used to determine the effects of temperature and Kelthane (organochlorine) on grass shrimp Crangon survival for exposure periods of 24, 48, and 72 hours under laboratory conditions. All specimens were collected from San Pablo Bay, California. Both elevated temperature and Kelthane concentration had a significant inverse effect on Crangon survival, and the responses to an increase in temperature and Kelthane concentration were strongly interdependent. As temperature increased, the Kelthane concentration lethal to a given percentage of shrimp decreased, and, conversely, as Kelthane concentration increased, the temperature lethal to a certain percentage of population decreased. The results are in general agreement with values reported for other aquatic animals. Sublethal effects of Kelthane on Crangon were also observed. Feeding, molting, and motor control were affected by Kelthane. (Bell-Cornell)
W77-08874

EFFECTS OF TREATED MUNICIPAL WASTEWATER AND COMMERCIAL FERTILIZER ON GROWTH, FIBER, ACID-SOLUBLE NUCLEOTIDES, PROTEIN AND AMINO ACID CONTENT IN WHEAT HAY,
Arizona Agricultural Experiment Station, Tucson.
A. D. Day, Abdul Rahman, F. R. H. Katterman, and Varon Jensen.
J Environ Qual. 3(1), 17-19, 1974.

Descriptors: *Water reuse, *Hay, *Crop response, *Wheat, *Irrigation effects, Fertilization, Crop production, Proteins, Amino acids, Irrigation practices, Irrigation water, Nutrients, Water sources, Arizona.
Identifiers: Fiber, Nucleotides, Triticum aestivum, Treated waste water, Nitrogen utilization.

Experiments were conducted at Tucson, Arizona to study effects of treated municipal wastewater on growth, total fiber, acid-soluble nucleotides, total protein and amino acids in hay from wheat (Triticum aestivum L.). Plant heights and number of culms per plant for wheat grown with wastewater were similar to plant heights and number of culms per plant when wheat was produced with well water and suggested amounts of N, P, and K and when it was grown with well water plus N, P, and K in amounts equal to those in wastewater. Wheat plants grown with wastewater had culms with a larger diameter and a higher total fiber content than did plants produced with the other treatments. Highest hay yields were obtained when wheat was grown with wastewater, followed by hay produced with well water plus N, P, and K in amounts present in wastewater, and hay grown with well water plus suggested amounts of N, P and K, in decreasing order. Wheat plants from the 3 irrigation and fertilizer treatments contained similar amounts of acid-soluble nucleotides. Wheat grown with well water plus N, P, and K in amounts equal to those in wastewater and hay produced with wastewater alone contained similar amounts of total protein, and more protein than did hay grown with well water plus suggested amounts of N, P, and K. Wheat utilized the N in wastewater more efficiently than it used the N in well water plus N, P, and K equal to wastewater. The amino acids alanine, glycine, phenylalanine and tyrosine were present in higher concentrations in wheat hay grown with wastewater than in hay produced with the other 2 treatments. Hay grown with the 3 irrigation and fertilizer treatments contained similar amounts of leucine, proline and threonine. When wheat hay was grown with wastewater, none of the observed amino acids were decreased below the levels at which they were present in hay produced with suggested cultural practices. Treated municipal wastewater was an effective source of irrigation water and plant nutrients for the production of high quality hay from wheat in the Southwest.--Copyright 1974, Biological Abstracts, Inc.

AN EXAMINATION OF SOME PHYSICAL AND BIOLOGICAL IMPACTS OF DREDGING IN ESTUARIES,
Oregon State Univ., Corvallis. School of Engineering; and Oregon State Univ., Corvallis. School of Oceanography.
L. S. Slotta, D. A. Bella, D. R. Hancock, J. E. McCauley, and C. K. sollitt.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-240 742, Price codes: A12 in paper copy, A01 in microfiche. Interim Progress Report to the National Science Foundation, December 1974. 262 p, 5 tab, 5 append. GI-34346.

Descriptors: *Estuaries, *Water pollution effects, *Environmental effects, *Baseline studies, *Resources development, Dredging, Monitoring, Toxins, Turbidity, Sediments.

The major research achievements of the NSF-RANN dredging research group at Oregon State University for the first 10 months of its activity is reported. The research focuses on 4 major topics: (1) the effects of dredging on estuarine research can be used effectively by user groups, and (4) the development of concepts and techniques for monitoring impacts of dredging and other alterations to estuaries. The various kinds of impacts discussed in the study include: impacts of dredging and marine traffic; impacts of sediment turnover; impacts of sediment physical changes; impacts of turbidity; and impacts of release of toxins from sediments. EFFECTS OF PRIMARY TREATED AND BIOLOGICALLY STABILIZED KRAFT MILL EFFLUENTS ON THE PRODUCTION, BIOMASS AND GROWTH RATES OF JUVENILE SALMONIDS IN THREE STREAM CHANNELS,
Oregon State University, Corvallis, Dept. of Fisheries and Wildlife.
D. L. Borton.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-269 023,

Price codes: A06 in paper copy, A01 in microfiche. Ph.D. Thesis, June 1975. 87 p, 16 fig, 8 tab, 32 ref, 3 append. OWRT B-029-ORE(1).

Descriptors: *Effluents, *Biomass, Fish, *Salmonids, *Pulp wastes, Biochemical oxygen demand, *Juvenile growth stage, *Growth rates, *Trout, Salmon, Lethal limit, Production, Biological treatment, Waste water treatment.
Identifiers: Production rates.

The effects of sublethal concentrations of primary kraft mill effluent and biologically stabilized kraft mill effluent on the biomass, growth rate, and production of cutthroat trout, Salmo clarki, coho salmon, Onchorhynchus nerka, chinook salmon, Onchorhynchus tschawytscha, and brown trout, Salmo trutta stocked in three experimental channels were studied from 1970 through 1973. These experiments were a part of an investigation of the direct and indirect effects of kraft mill effluents on fish growth and production. Three stream channels, 100 meters long and 2 meters wide with 11 riffles and 11 pools, received 12.7 liters per second each of dilution water pumped from the Willamette River during the entire experimental period. Primary KME from the settling lagoon of an Oregon pulp mill entered one of the streams at a rate of 0.75 mg per liter BOD during experimental periods I and II from January 2, 1970 to March 12, 1971. Biologically stabilized KME from the aeration lagoon of the pulp mill entered stream 2 at 0.75 mg per liter BOD during experimental periods III, IV, V, and VI from March 16, 1971 to January 30, 1973. PHYSICAL AND CHEMICAL PARAMETERS ASSOCIATED WITH PHYTOPLANKTON ABUNDANCE AND PERIODICITY IN A FERTILIZED FISH POND,
Auburn University, Auburn, Alabama, Dept. of Fisheries and Allied Aquacultures.
R. W. Parks.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-268 995, Price codes: A04 in paper copy, A01 in microfiche. Master of Science Thesis, March 18, 1975. 52 p, 12 fig, 93 ref. OWRT A-042-ALA(2).

Descriptors: *Phytoplankton, Dissolved oxygen, Alkalinity, Carbon dioxide, Nitrates, Nitrogen, Solar radiation, Light penetration, Wind velocity, Air temperature, Fish hatcheries, *Cyanophyta, Anabaena, Water pollution effects.
Identifiers: Soluble inorganic phosphorus, Die-offs, *Anabaena circinalis, *Microcystis aeruginosa.

Physical and chemical parameters associated with phytoplankton abundance and periodicity were studied in a pond (S-3) at the Auburn University Fisheries Research Unit, Auburn, Alabama, from February 1, 1974 to September 6, 1974. Data involving water temperatures, dissolved oxygen, pH, alkalinity, free carbon dioxide, soluble inorganic phosphorus, nitrate-nitrogen, ammonia-nitrogen, incident solar radiation, light penetration, air temperatures, and wind velocity were recorded. Attempts were made to find correlations between the information obtained from the data and the periodicity and abundance of phytoplankton in S-3. Two species of blue-green algae, Anabaena circinalis (Kutz.) Rab. and Microcystis aeruginosa Kutz. were studied in particular. These two species dominated the phytoplankton population at different times of the year. Several die-offs of these species occurred in which only a portion of their populations died. Factors responsible for these partial die-offs were hypothesized. Chemical factors had little effect on these die-offs, instead the die-offs had a noticeable effect on the chemical parameters. Physical factors were thought to set conditions which eventually lead to the die-offs. It was hypothesized that the lack of wind action allowed surface scums of Anabaena circinalis and Microcystis aeruginosa to form. Other physical factors such as light and temperature then contributed to the death of the algal cells near the surface.

Descriptors: *Invertebrates, Oxygen, *Dissolved oxygen, *Mortality, Water pollution effects, *Ohio, *Bioassay, *Benthic fauna, Mayflies, Stoneflies, *Aquatic insects, Dragonflies, Amphipoda, *Crustaceans, Clams, Snails, Isopods, Crayfish, Caddisflies, Larvae, *Lethal limit.
Identifiers: Damselflies, Alderflies, Water penny, Hellgrammites, Craneflies, Horseflies, Whirligig beetles, *Oxygen level fluctuations.

The objective was to explore, experimentally, the lowest levels of dissolved oxygen that could be tolerated by some of the common invertebrate animals of streams in the Cincinnati area. Most of the bottom animals used in the experiments were collected from riffles of the Little Miami River above Milford, Ohio; the East Fork of the Little Miami above Batavia; the Mad River above Urbana, Ohio; and Mt. Carmel Creek near Mt. Carmel, Ohio. The experiments were carried out in a constant temperature bioassay room of EPA's Robert A. Taft sanitary Engineering Center, Cincinnati, Ohio. Results of all experiments are summarized; specimens used in the experiments, elapsed time of each experiment, the experimental dissolved oxygen, and mortality data are presented. The following species or specimens were investigated: Sphaerium striatinum; Goniobasis livescens; Lirceus fontinalis; Crangonyx setodactylus; Gammarus fasciatus; Cambarus ortmanni; Orconectes rusticus; Stenonema tripunctatum; Stenonema heterotarsale; Stenonema ares; Stenonema vicarium; Stenonema femoratum; Heptagenia maculipennis; Heptagenia flavescens; Leptohlebia; Isonychia bicolor; Ephoron leukon; Hexagenia limbata; Acroneuria lycorias; Neoperla clymene; Phasganophora capitata; Psephenus herrick: Corydalus cornutus; Sialis; Agrion maculatum; Argia moesta; Boyeria vinosa; Anax junius; Plathemis lydia; Hdropsyche slossonae; Tipula abdominalis; Tabanus; Hyalella azteca; and Dineutes.

A PREDICTIVE PHOSPHORUS MODEL FOR LAKES - DEVELOPMENT AND TESTING,
North Carolina University, Chapel Hill, Department of Environmental Sciences and Engineering.
W. J. Snodgrass.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-268 985, Price codes: A15 in paper copy, A01 in microfiche. PhD Thesis, 1974. 309 p, 61 fig, 27 tab, 127 ref, 5 append. OWRT A-074-NC(1).

Descriptors: Phosphorus, Eutrophication, Lakes, *Mathematical models, Cycling nutrients, *Input-output analysis, Seasonal, Water pollution effects, Water pollution sources, Nutrients, *Model studies.
Identifiers: *Phosphorus concentration models. Hydraulic loading.

The main goal was to develop a mathematical input-output model capable of predicting the phosphorus concentration in a lake as a function of mean depth, hydraulic loading, and nutrient loading to the lake. The developed model shows excellent agreement between observed and predicted phosphorus concentrations for lakes with a wide range of mean depths (14-300 m) and hydraulic detention times (1 to 700 yr.). For lakes with oxic hypolimnia, the model is verified to make predictions concerning (1) the P concentration in a lake resulting from a given rate of input of P and (2) the extent of lake improvement which can result from a given reduction in the land-based nutrient loading. Model predictions of the P retention factor are made for hydraulic loadings and mean depths characteristic of a wide range of lakes, and are described by nomographs. Sensitivity analyses indicate that the model is most sensitive, in decreasing order of sensitivity, to the input rate of P, the settling coefficient, and the decomposition coefficient. The model is fairly sensitive to vertical exchange across the thermocline, but quite insensitive to the epilimnetic production coefficient and the epilimnetic depth. Model predictions of temporal trends are compared with observed monthly values for Lake Ontario and Sempachersee and with recovery of Lake Washington after removal of sewage inputs. Model predictions of mass flows between P compartments and the time to reach stable-state are analyzed. Sufficient data for verifying these model predictions are not available. Descriptors: *Marine bacteria, Marine microorganisms, Microbiology, *Nitrites, *Nitrogen compounds, *Nitrogen cycle, Nitrogen fixation, *Ammonia, Ammonium compounds, *Ammonium salts, Hydrogen ion concentration, Analytical methods, Kinetics, Water pollution effects.
Identifiers: *Ammonium chloride, *Nitrifying bacteria, First-order rate equations, Michaelis-Menten kinetics.

Large, stable, reproducible populations of nitrifying bacteria may be defined and maintained by a daily ammonium chloride input to a bacterial culture. The rate of conversion of ammonium ion and

LIBRARY U. OF I. URBANA-CHAMPAIGN

rite ion by large populations of nitrifying bac-
ia may be described accurately by first-order
e equations. The first-order rate equations may
combined to provide more general equations
t include consideration of the consecutive na-
e of the nitrification process. Michaelis-Menten
etics may be used to explain the decrease in the
t-order rate constant at high initial concentra-
ns of ammonium or nitrite ions. The tempera-
e, pH, and sulfide ion concentrations signifi-
tly affect the rate of nitrification, while small
nges in salinity, (5 to 8 ppt) do not. (Katz)

ENVIRONMENTAL LIMITATIONS ON THE MICROBIAL DEGRADATION OF HYDROCARBONS IN TEMPERATE LAKES,
Wisconsin Univ.-Madison. Dept. of Bacteriology.
D. M. Ward.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-269 193, Price codes: A09 in paper copy, A01 in microfiche. Ph.D. Thesis, 1975. 136 p, 5 tab, 14 fig, 70 ref. OWRT A-054-WIS(1), 14-31-0001-3850, 14-31-0001-5050.

Descriptors: *Microbial degradation, Environmental effects, *Oil pollution, *Nitrogen, *Phosphorus, *Wisconsin, Lakes, Organic compounds, Water pollution effects, Bacteria, Biodegradation, *Nutrients.

Nutritionally versatile heterotrophic bacteria inhabit lakes and develop in response to hydrocarbon introduction. However, the response of naturally-occurring oil-degrading microorganisms depends on environmental conditions within a lake. The rate of hydrocarbon biodegradation varied seasonally in Lake Mendota because of temperature limitation in spring and fall and nutrient limitation in mid-summer, and was optimal for only one month during the year. Nutrient limitation was also observed in lakes of varying nutrient content in Vilas County. Relationships between hydrocarbon oxidation rates and temperature or nutrient levels were shown by correlation and experimentally, and optimum conditions were established. Hexadecane oxidation was inhibited in lake water and sediment samples incubated anaerobically. The lack of oxygen also inhibited hexadecane oxidation in the presence of nitrate, a thermodynamically favorable electron acceptor. Acetate and glucose were also found to inhibit hexadecane oxidation in lake water samples. Acetate inhibition was indirectly caused by depletion of nitroglen and phosphorus by acetate-oxidizing bacteria. Glucose inhibition occurred in the presence of excess nitrogen and phosphorus and may result from regulatory interference such as catabolite repression. The presence of oil-degrading bacteria does not ensure rapid removal of oil pollutants in temperate lakes where environmental conditions usually limit hydrocarbon biodegradation. (See also W75-10407)
W77-09059

ENVIRONMENTAL REGULATION OF GAMETOGENESIS IN SCENEDESMUS OBLIQUUS,
Connecticut Univ., Storrs.
J. R. Cain.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-269 146, Price codes: A05 in paper copy, A01 in microfiche. Ph.D. Dissertation, 1975. 60 p, 5 tab, 9 fig, 48 ref, 2 append. OWRT A-052-CONN(5), 14-31-0001-3507.

Descriptors: *Environmental control, *Algae, *Cultures, *Nutrients, *Nitrogen, *Light, *Temperature, *Water pollution effects, Incubation.
Identifiers: *Gametogenesis, *Scenedesmus obliquus, Laboratory media, Salt concentrations.

The roles of nutrients, light and temperature in regulating Scenedesmus obliquus gametogenesis have been studied in culture. Gametogenesis is inhibited by the presence of nitrogen, but not by the presence of other medium components, at the concentrations found in a routine algal culture medium. Data indicate, however, that gametogenesis is not a response to nitrogen depletion or starvation. Nitrogen concentration in the medium determines the number of cells in the culture which will form gametes, but does not affect the rate of gamete production or time of onset of gametogenesis. Temperatures 30C or higher not only inhibit gamete formation, but are detrimental to survival of gametes formed at lower temperatures. A minimum of 20-24 hours exposure to favorable nitrogen levels and 15C temperature is required before any cells in the culture reach a point of no return for gamete formation. Light stimulates gametogenesis, but is not an absolute requirement, as a small but significant number of cells are capable of producing gametes in the absence of light, under nitrogen concentrations favorable to gametogenesis. The stimulatory effect of light depends upon exposure both early and late in the incubation period for gamete induction. Cultures maintained in the laboratory lose their capacity for gamete formation; evidence indicates that unnaturally high salt concentrations in laboratory media are involved. MAN'S EFFECT ON THE FISHES OF THE UPPER SHETUCKET RIVER SYSTEM,
Connecticut Univ., Storrs.
R. M. Goldstein.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-269 094, Price codes: A03 in paper copy, A01 in microfiche. Ph.D. dissertation, 1975. 43 p, 14 tab, 6 fig, 64 ref. OWRT A-052-CONN(8), 14-31-0001-3507.

Descriptors: *Fish populations, *Physiological ecology, *Fish management, Water pollution effects, *Sewage effluents, *Water level fluctuations, *Urbanization, *Silting, Impoundments, Dams, *Connecticut.
Identifiers: *Fish species composition, *Human influence index, Seining, Snorkeling, *Upper Shetucket River system(Conn).

Man's effect on the fishes of the upper Shetucket River System and the effect of the city of Willimantic on fishes were determined by (1) comparing changes in species composition in the four major rivers on the upper Shetucket River system, above and below the city of Willimantic, and growth of fishes above and below the city, with expected trends or values; (2) evaluating historical information on the building of dams, growth of industry and human population, and a present 'human influence index' with relative abundance of selected species; and (3) comparing species composition and a 'human influence index' in the Shetucket River with trends developed from 15 rivers in southern New England. The fishes of all four rivers of the upper Shetucket River system were affected to some degree by man; and the city of Willimantic did affect fish populations

downstream. The effects of fluctuating water levels from power generation at Scotland Impoundment are discussed. This factor may have had greater effects on fish populations below the city of Willimantic in the Shetucket River than any of man's other actions. (de Lara-Conn)

WILLIMANTIC RIVER ORGANISMS GROWN IN MEDIA WITH NATURAL SUBSTRATE LEVELS AS INOCULA FOR ALGAL ASSAYS,
Connecticut Univ., Storrs, Inst. of Water Resources.
F. R. Trainor.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-269 192, Price codes: A01 in paper copy, A01 in microfiche. Completion Report, 1977. 18 p, 13 fig, 1 tab, 1 ref. OWRT A-061-CONN(1). 14-31-0001-6007.

Descriptors: *Algae, Assay, *Carrying capacity, *Nutrients, *Sewage effluents, *Growth rates, *Nitrogen, *Phosphorus, Chlorella, *Connecticut, *Bioassay, Water pollution effects, Pollutant identification.
Identifiers: *Growth media evaluation, *Natural substrate levels, *Nutrient carryover, *Maintenance media, *National test organism, Ankistrodesmus, Selenastrum, *Willimantic River(Conn), *Algal growth.

Field and laboratory studies were utilized in the evaluation of the Willimantic River as a growth medium for Selenastrum, Chlorella, and Ankistrodesmus. The algae were grown in low nutrient water collected above and below the University of Connecticut sewage effluent as well as in the nutrient rich effluent itself. The growth of all three algae (as measured in doublings per day) increased in the effluent medium. Phosphorus, measured as orthophosphate, was the limiting nutrient. The order of algal growth in the nutrient poor water was Chlorella, Selenastrum, and Ankistrodesmus (PO4 = .07-.47 mg.l-1). When nutrient rivch water was used, the order of growth was Chlorella, Ankistrodesmus, and Selenastrum (PO4 = 1.0-5.0 mg.l-1). At extremely high phosphorus (PO4 greater than 5.0 mg.l-1) Ankistrodesmus became the most actively growing alga followed by Chlorella and Selenastrum. Nitrogen effects seem to be secondary. The primary usable nitrogen source in this system was NO3. NH4 has little effect on algal growth at natural levels and becomes toxic at high concentrations. N/P ratios did not adequately define the carrying capacity of this system. Medium 3.6 was evaluated in terms of its suitability as a maintenance medium for the three algae. Lowered nitrogen or phosphorus resulted in Selenastrum death and inconsistent Chlorella and Ankistrodesmus growth. Increased nitrogen or phosphorus resulted in carry-over on all cases. (de Lara-Conn)

EFFECTS OF PRIMARY SEWAGE EFFLUENT FROM THE CITY OF WILLIMANTIC ON THE BENTHIC INVERTEBRATE FAUNA OF THE WILLIMANTIC/SHETUCKET RIVERS,
Connecticut Univ., Storrs.
R. P. Klattenberg.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-269 187, Price codes: A04 in paper copy, A01 in microfiche. Master of Science Thesis, 1974. 68 p, 10 fig, 12 tab, 47 ref, append. OWRT A-052-CONN(4), 14-31-0001-3507.

Descriptors: Water pollution effects, *Sewage effluents, *Silting, *Benthic fauna, *Invertebrates, *Aquatic fungi, Physicochemical properties, Carrying capacity, Organic loading, Sewage treatment, *Connecticut, Artificial substrates, Sampling, Monitoring, Pollutant identification.
Identifiers: Hester-Dendy samplr, *Willimantic/Shetucket Rivers(Conn).

A year-long water quality sampling program was conducted to evaluate what effects sewage discharge by the Willimantic Sewage Treatment Plant had on the physicochemical characteristics and benthic macroinvertebrates of the Shetucket River, Connecticut. Benthic macroinvertebrates were collected above and below the sewage discharge at sixteen sampling stations using Hester-Dendy artificial substrate samplers. Water quality analysis and the presence of Tricoptera larva indicated the Willimantic/Shetucket Rivers to be affected only marginally by organic loading and temporary heavy siltation, resulting from construction activities at the new treatment plant site. Nutrient enrichment resulted in an abundance of 'sewage fungus' below the sewage treatment plant. A larger population of three taxa of benthic macrofauna (Tendipedidae as a group and two genera of Hydropsychidae) below the sewage treatment plant was attributed to increased carrying capacity associated with the sewage fungus organic matter which the benthic macrofauna could utilize as food. Sampler selectivity seemed to be reflected in the limited benthic fauna collected along the study reach as well as in the high positive relationship between increases in silt collecting on samplers and standing crop biomass. Color illustrations reproduced in black and white. (de Lara-Conn)

THE EFFECT OF THE WILLIMANTIC SEWAGE TREATMENT PLANT ON THE MICROFLORA AND METABOLISM OF THE SHETUCKET RIVER,
Connecticut Univ., Storrs.
E. A. Matson.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-269 183, Price codes: A05 in paper copy, A01 in microfiche. Master of Science Thesis, 1975. 78 p, 14 fig, 14 tab, 98 ref. OWRT A-052-CONN(6), 14-31-0001-3507.

Descriptors: *Aquatic microorganisms, Sewage effluents, Water pollution effects, *Chlorination, *Productivity, River flow, *Coliforms, Aquatic bacteria, Yeasts, *Connecticut, Bioindicators, *Streptococcus.
Identifiers: *Indicator microbial populations, *Dissolved organic carbon, Net community production, *Shetucket River(Conn).

This study was initiated to determine the effects of the effluent of the Willimantic, Connecticut Sewage Treatment Plant (STP), which accounts for an annual average of 1% of river volume, on the indicator microbial populations, dissolved organic carbon (DOC), productivity and metabolism of the Shetucket River. Total fecal coliforms, fecal streptococci, 'plate count' bacteria and yeasts capable of growth at 20 and 37 C were monitored biweekly for 16 months. DOC was measured seasonally and diurnally for one year using the thermal combustion technique. Net community production was measured using the upstream-downstream technique and respiratory estimates were made for fish and invertebrates. The results indicate that during nonchlorination periods, populations of indicator microflora downstream of the treatment plant are substantially higher than those upstream, and are also modified by dilution of the effluent due to seasonal trends in river volume. During chlorination periods downstream populations are generally equal to or less than those upstream. The sewage treatment plant does not significantly affect productivity or metabolism of this otherwise eutrophic river. However, during low river flow in summer, the increased DOC load due to the treatment plant can reduce net community production by half. (de Lara-Conn)

Identifiers: *Two-membered algal assay, *Attached algae, *Competitive balance, *Sewage treatment effluent, Achnanthes deflexa, Unicellular algae, *Willimantic/Shetucket Rivers(Conn).

Field and laboratory procedures have proven that the secondarily treated effluent from the Willimantic, Connecticut sewage treatment plant influences the composition of the attached algal flora in the Shetucket River. This effect is due to the effluents altering the competitive balance between the two algal species. A unicellular alga completely dominates highly polluted stretches of the river, while Achnanthes deflexa shares dominance with this organism in other areas. The degree of river pollution can be estimated by enumerating the natural standing crops of these two algae. A two-membered assay utilizing these organisms is a sensitive laboratory pollution monitor and a useful predictive tool. (de Lara-Conn)

Songbird responses to the irrigation of wastewater appeared to be closely correlated with habitat alterations and changes in food sources and avilability. The mixed-oak area had a higher capture rate on the non irrigated site during the first half of each of the two summers with a change in songbird activity occurring in mid-July. During the second half of the summer in both 1972 and 1973, significantly more birds per unit of netting time were caught on the irrigated site of the mixed-oak forest and this increase in activity appeared to be related

nperature, Suspended solids, Chemical oxygen
nand, Nitrogen, Hydrogen ion concentration,
alinity, Waste water treatment.

The relationship between nitrification and heavy metal removal was investigated in the activated sludge treatment process. Chromium was studied at 0.1-10.0 milligrams/liter, and silver was studied at 0.1-0.5 milligrams/liter in settled primary domestic sewage. The analyses covered heavy metal concentration, pH, dissolved oxygen, temperature, suspended solids, chemical oxygen demand, nitrogen species, and alkalinity. There were indications that sludge wasting rates are directly related to heavy metal removal. Nitrification indirectly affects the process because sludge wasting controls sludge age, which controls nitrification. A theory on the mechanisms of heavy metal removal was developed; sludge wasting was considered the key mechanism of this process. (Collins-FIRL)

PREDICTION OF NITROGEN TRANSFORMATIONS IN THE STORAGE LAGOON OF A LAND TREATMENT SYSTEM,
Massachusetts Univ., Amherst.
Y-S. Su.
Available from University Microfilms, Inc., Ann Arbor, Mich., 48106. Order No. 77-6425. PhD Thesis, 1976. 178 p.

Descriptors: *Storage, *Lagoons, Biological treatment, Algae, Bacteria, Nitrogen, Model studies, Nitrification, Ammonification, Pilot plant, Sewage effluents, Irrigation, Waste water treatment.
Identifiers: Land treatment system.

The influence of storage lagoons on the nitrogen balance in a land treatment system was studied. The lagoon functions as a biological reactor where algae and bacteria transform input nitrogen. A simulation model was developed to predict yearly concentrations of ammonium, nitrate, organic nitrogen and algae in the lagoon. Ammonification, nitrification, and algal uptake were considered, as were the effects of temperature, solar radiation, and rate-limiting nutrients. Data were taken from a storage lagoon with a three-month winter storage followed by a nine-month empty period. There was a great reduction of obtainable inorganic nitrogen during a substantial portion of the irrigation period; algal uptake of nitrogen was indicated as the most important factor in the lagoon's dynamic behavior. Algal growth and death rate constants had the greatest effect on ammonium-N and nitrate-N-profiles. Nitrification and ammonification were much less important. Reductions in the required irrigation land area resulted from the decrease in nitrate due to storage lagoon transformations. Lagoon effluent should be blended with secondary effluent in varying ratios during the growing season in order to design a system with a nitrogen supply equal to crop demand. (Collins-FIRL)

Descriptors: *Fluorine, *Separation techniques, *Calcium compounds, *Waste water treatment, Pollution abatement, Lime, Magnesium, Coagulation, Chemical reactions, Analysis.

Various chemical reagents were tested in an investigation of fluorine removal from waste water. Lime added to a dilute hydrogen fluoride solution produced minute calcium fluoride particles; a portion of these tended to pass through a filter. Magnesium was found to reduce crystal size, make precipitate gelatinous, and aid separation and coagulation. It did not reduce fluorine below 15 ppm since magnesium fluoride is more soluble than calcium fluoride. The length of time needed to reduce the supersaturation of calcium fluoride was the major obstacle in reducing fluorine to meet water quality standards. The addition of lime raises the pH and causes fluorine removal to be difficult in waters with a high concentration of alkaline substances. Reduction of fluorine was aided by the addition of an acid or soluble calcium compound. (Collins-FIRL)

WHAT'S UP WITH OXYGEN/2,
Brown and Caldwell, Walnut Creek, Calif.
B. D. Bracken.
Water and Wastes Engineering, Vol. 14, No. 4, p 48-49, 52-56, April, 1977. 3 fig, 2 tab.

Descriptors: *Oxygen, *Treatment facilities, Design criteria, Construction, Equipment, Water purification, Cooling water, Heat balance, Personnel, Instrumentation, *Waste water treatment, Electric power demand, Heat exchangers.
Identifiers: *Liquid oxygen.

Design factors are discussed in the second of two articles on cryogenic oxygen plants. Heat exchange is a part of the oxygen production process. A cryogenic expansion turbine produces refrigeration for air separation and liquid production. Plants with a capacity of 180 tons/day or more generate enough work to justify the equipment necessary to recover the work as electrical power. About 75 kw can be obtained from a plant of this size operating at maximum design production. Liquid oxygen is stored near the cryogenic oxygen plant in horizontal or vertical tanks. These are double-walled and designed to reduce oxygen losses to 0.3-0.4% per day of contained oxygen by weight. Oxygen vaporizers are used to convert stored liquid oxygen to vapor for a supplemental or substitute oxygen source to supply the dissolution system. Vaporization of one ton of liquid oxygen stored at just under the boiling point will require 92 Btu/pound or 184,000 Btu/ton. Liquid oxygen vaporization can be conducted with a water-to-oxygen heat exchanger. This heat exchanger. This heat exchanger can provide the continuous heat so that vaporization may be instituted at any time necessary. Considerations for a cryogenic oxygen plant for municipal waste water treatment include plant size, electrical requirement, cooling water needs, effluent heat load, noise levels, instrument or dry, filtered, oil-free air requirements, staff requirement, site requirements, and instrumentation and control equipment. WASTE WATER AERATION SYSTEM PRODUCES SMALL BUBBLES.
Chemical Engineering, Vol 84, No 9, p 81-82, April, 1977.

Descriptors: *Aeration, Equipment, *Performance, *Evaluation, Operating costs, Capital costs, Oxidation lagoons, Chlorination, Treatment facilities, Municipal wastes, *Waste water treatment.

The Aerocleve submerged secondary treatment aeration system is described by Clevepak Corp., Fall River, Massachusetts. It was promoted as being 150% as effective as mechanical surface aerators. A bubble diameter of 0.2-0.4 millimeters is produced as compared to 1-2 millimeters from

diffused-air systems and 2-2 1/2 millimeters from mechanical surface devices. Air and recirculated waste water are concurrently passed at different velocities through the mixing chamber, creating air pockets. A vortex and fine air bubble mist are formed from exerting a compressive force on the air pockets. The bubble stream discharges as a high-velocity, turbulent horizontal plume. Increased dwell time is the result; this, combined with the small bubble diameter, produces an efficient use of energy. Operating costs are 50% that of diffused-air systems and 75% that of surface aeration. Capital costs are 30% less than diffused air and 20% less than surface aeration. Clogging is avoided in this system by eliminating porous plates and perforated sparges; the smallest passage is 1 1/4 inches in diameter. There are no moving parts in the manifolds or mixing chambers. Submerged parts are constructed of polyvinyl chloride or stainless steel. The system can be used for deep-tank applications, activated sludge aeration basins, and extended aeration lagoons. It is useful in upgrading conventional diffused-air systems and is especially useful in freezing climates. It can also be used in package treatment plants, and in chemical mass transfer and chlorination processes. Field tests showed a 50% reduction in power costs in municipal applications. (Collins-FIRL)

NEW PLYMOUTH SEWERAGE SCHEME,
J. R. Fitzmaurice.
New Zealand Engineering, Vol 32, No 2, p 26-30, February, 1977. 4 fig, 6 ref.

Descriptors: *Sewers, Drainage, *Outfalls, *Waste water treatment, Waste disposal, Bacteria, Sewage effluents, *Treatment facilities, Environmental effects, *Water pollution control, Construction, COsts, Waste disposal.
Identifiers: New Plymouth(New Zealand).

Treatment schemes were devised for New Plymouth, New Zealand, after a survey to determine the inadequacies of its sewerage system. The studies indicated that outfalls would be very expensive and few locations were adequate for them. Surface movement of water near the shoreline and strong winds would not regularly assist diluted waste discharge movement in either direction along the coast. There are no present water quality standards for receiving waters, but any treatment system should be adaptable for easy and economical improvements if standards are later required. Several alternative plans were considered involving outfalls at various locations, varying treatment levels, disposal to oxidation ponds, and drainage systems. Environmental impact studies were also conducted. The treatment plant proposed for the area will be a primary treatment facility with provisions for adding secondary treatment and chlorination. The level of treatment will depend on water quality standards to be developed and may alter with time. Processes included will be screening, grit removal, sedimentation, and sludge digestion. Power will be derived from process methane and the on-site generation of electricity. Capital costs are expected to be about $8,230,000, with annual costs of about $965,000. (Collins-FIRL)

PRETREATMENT HELPS NIAGARA CUT COSTS,
Niagara Falls Sewage Dept., New York.
J. Sirianni, and E. C. Richardson.
Water and Wastes Engineering, Vol 13, No 11, p 44-46, 51, November, 1976. 1 fig, 1 tab.

Descriptors: *Treatment facilities, *Costs, *Pollution abatement, *Industrial wastes, *Waste water treatment, Cities, Water purification, Nitrification, Activated sludge, Filtration, Adsorption, Water pollution sources, *Pre-treatment(Water).
Identifiers: Niagara Falls(NY).

Pretreatment of industrial wastes and reuse of existing municipal facilities have reduced costs at a new treatment facility in Niagara Falls, New York. Alteration in treatment processes were investigated in 1971 due to the discharge into the river of 164 mgd of waste water by industries involved in electrochemical, electrometallurgical, paper, food, organic chemical, and abrasive products. Water quality standards were instituted for effective disinfection; substantial removal of settleable and flotable solids; an effluent phenol concentration of less than 5 ppb; a pH of 6.7-8.5; a minimum dissolved oxygen concentration of 4 ppm; and the maximum possible removal of phosphates. A physical-chemical process using activated carbon for filtration and adsorption was used. The plant has a 48 mgd capacity and is located on the site previously used by a power generating facility. The tailrace tunnel of the power plant was rehabilitated to be used as an outfall and a 210,500-foot-long, six-foot-diameter, concrete-lined rock tunnel intercepting sewer was constructed. Cost savings resulted from early industrial cooperation to reduce pollution; the joint treatment facility which created economy of scale savings; the reuse of the tailrace tunnel of the power plant; the use of parts of the city's former treatment plant foundation for the new pumping station; the regeneration of exhausted carbon used for filtration and adsorption; and the use of plant effluent to backwash carbon. The toxic effects of chemical wastes on microbial populations precluded biological treatment, so the physical-chemical system was used. Sludge is disposed in landfills. This arrangement allows nitrification, conventional activated sludge and contact stabilization, or combinations of any two processes. (Collins-FIRL)

APPLICATION OF PHYSICO-CHEMICAL TREATMENT AS A METHOD OF ACHIEVING PARTIAL STANDARDS ON SEWAGE EFFLUENTS DISCHARGED IN ESTUARIAL AND COASTAL SITUATIONS,
Anglian Water Authority, Huntingdon (England). Directorate of Scientific Services.
P. J. Matthews.
The Public Health Engineer, Vol 5, No 2, p 31-37, March, 1977. 3 tab, 49 ref.

Descriptors: *Water quality standards, Sewage effluents, Estuaries, Coasts, Water purification, Industrial wastes, Electrolysis, *Waste water treatment.
Identifiers: England.

Applying variouss physico-chemical treatment (PCT) methods to wastes which would be discharged to estuaries and coastal waters in England was considered. There has been a continuing argument for and against treatment of wastes for this type of disposal. Those in favor of treatment stress that oceans must be protected, and that treatment would diminish disease, eliminate long outfalls conflicting with other water uses, and remove certain pollutants which would otherwise persist. Those opposing treatment emphasize that great amounts of oxygen in the sea purify wastes, and that dilution renders the waste similar to biologically treated effluent. They add that costs are less for operating an outfall and that a well-sited outfall is less aesthetically objectionable. PCT was used in the nineteenth century, but biological treatment outweighed it by appearing more effective and by producing a more easily disposable sludge. Chemicaly aided sedimentation can be of use, however, where there is a solids standard of 60 to 150 milligrams/liter of suspended solids, or where this standard and a BOD and/or a COD limit are appropriate. The most common systems of chemical sedimentation include lime, ferric and ferrous salts, alum alone or with anionic polyelectrolytes, and cationic polyelectrolytes. These can be added before wastes undergo flocculation chamber followed by sedimentation tank treatment, or before combined flocculation/sedimentation tank treatment. The sludges produced are less filterable than primary sludges, but they can be treated, disposed of, or used in agriculture. Lime seems to be the most cost effective coagulant/flocculant. Partial treatment allows for shorter effluent pipelines than needed for crude sewage outfalls. Higher hydraulic loadings permit reduced sedimentation tank size and reduced sedimentation capital costs. The drawbacks to lime treatment are possible increases in capital costs by as much as 200% and in operating costs by 10-20% over sedimentation costs. Finally, the effects of coagulants, flocculants, and their impurities on effluent quality and sludge production must be considered. (Collins-FIRL)

SEWAGE TREATMENT IN DEVELOPING COUNTRIES,
Loughborough Univ. of Technology (England).
J. Pickford.
Water Pollution Control, Vol 76, No 1, p 65-66, 1977. 1 tab.

Descriptors: *Sewage treatment, *Urban areas, *Water supply, Water quality, Water quality control, Sanitation engineering, Sewage disposal, Domestic wastes, Septic tanks, Separate sewers, Oxidation lagoons, Corrosion, Economics, Activated sludge, *Waste water treatment.
Identifiers: *Developing nations.

Factors associated with sewage treatment in developing countries were discussed. The high growth rate of urban populations is characteristic of most of these nations, and the phenomenon of shanty-towns is a growing problem. Approximately two-thirds of these urban populations have access to piped water, though it may be intermittent or from public standpipes. Empty pipes contribute to inward leekage of groundwater which may be polluted where there is inadequate sanitation. Excreta is usually handled by municipal treatment, but often water is insufficient for basic needs, and it cannot be spared for toilet flushing. Pit latrines, septic tanks, and aqua-privies all have some drawbacks. Nightsoil is often buried in trenches but is usually treated with sewage sludge and in aerated lagoons. Separate sewage systems are used because of the heavy rainfalls in most developing countries and sewage blockage is common, as are problems resulting from hot climates, such as sewer corrosion. Stabilization ponds are ideal for many of these nations because they are simple, requie easy maintenance, use little imported materials, and have no power requirements. Diffused-air activated-sludge treatment and biological filters can also be used, but capacity in tropical climates can be less than in temperate areas. (Collins-FIRL)

CONTROLLING SLUDGE BULKING,
D. Liu, K. Kwasniewska, and D. B. Cohen.
Water and Sewage Works, Vol 124, No 3, p 52-53, March, 1977. 3 fig, 4 ref.

Descriptors: *Sludge treatment, *Activated sludge, *Microorganisms, Chlorination, Dissolved oxygen, Performance, *Waste water treatment, Analytical techniques, Laboratory tests, Biological treatment, Chemical treatment.
Identifiers: *Sludge bulking, Filamentous microorganisms.

Filamentous microorganisms have contributed to the problem of activated sludge bulking. Various means used to control them include chlorination,

ydrogen peroxide treatment, increasing the dissolved oxygen of the return sludge, and reducing ne sludge loading rates. A program was conducted o establish means for isolating these microorganms from normal and bulking sludges. Testing evealed two compounds which had a high selecve specificity for filamentous microorganisms: n-myl alcohol (n-pentanol) and isoamyl alcohol. his provided the basis for procedures to isolate ne microorganisms. Various amounts of n-amyl lcohol are added to four flasks containing a odified nutrient broth. The flasks are shaken to nsure homogeneity and one drop of bulking ludge is added to each. The broth is checked very 24 hours for the growth of filamentous nicroorganisms, after incubation at room temerature on a gyrotary shaker. If filamentous nicroorganisms growth is substantial the broth hould be streaked on a pre-dried modified utrient agar plant for microorganism isolation. A econd procedure involves adding bulking sludge r normal sludge to a sterile test tube, and then ading n-amyl alcohol and sterile distilled water. hese are mixed, allowed to stand at room temerature, and mixed again. Three samples are uickly plated onto the pre-dried modified nutrient gar plates. The plates are incubated until there is omplete colony development. Biochemical and axonomical tests may be performed or colonies nay be transferred to modified nutrient broth vithout n-amyl alcohol to confrim the procedure. Collins-FIRL)

THE USE OF PACKED BEDS IN WATER POLLUTION CONTROL,
K. E. Porter.
La Tribune du Cebedeau, Vol 30, No 398, p 30-42, January, 1977. 16 fig, 5 tab, 11 ref.

Descriptors: *Packed beds, *Design criteria, *Mass transfer, *Biological treatment, Water pollution control, Filtration, Microorganisms, Biochemical oxygen demand, Industrial wastes, Plastics, Mineralogy, Organic matter, Separation techniques, Water purification, Treatment facilities, Costs, Physicochemical properties, *Waste water treatment, Performance, Evaluation.

Various types and designs of packed beds, as well as design criteria and mass transfer mechanisms used in water pollution control were described. The filter bed process generally involves two settling tanks with an intermediate filter treatment step. Microorganisms which consume the organic pollutant, in packed filter beds, grow over the surfaces of the packing as a film. The biomass removes BOD and becomes the solid product to be settled out. Packed beds are economical in situations where there is high BOD and/or high BOD concentrations maintained throughout the packed bed. Higher organic loading on the packing produces lower treatment costs, but increases the chance of blockage. Mineral media have been traditionally used. Modern packings include plastics such as polystyrene, polypropylene, and polyvinyl chloride, and various forms of vertical sheets and vertical tubes which allow organic loading to be increased about twenty times that used with the traditional packing. Packed beds are used to partially treat industrial wastes and industrial waste waters that cannot be treated with activated sludge methods, and to increase the capacity of existing sewage plants. Design techniques are reviewed with data on design criteria. Equations are presented for the biochemical rate and limiting solutions for diffusion and reaction in the biomass film, and for boundary conditions. Factors involved in the derivation of design equations were also considered. (Collins-FIRL)
W77-08637

OZONE DISINFECTION OF SECONDARY EFFLUENT,
PCI Ozone Corp., West Caldwell, N.J.
L. J. Bollyky, and B. Siegel.
Water and Sewage Works, Vol 124, No 4, p 90-92, April, 1977. 5 fig, 2 tab, 5 ref.

Descriptors: *Ozone, *Disinfection, Performance, Evaluation, Costs, Coliforms, Design criteria, Water quality control, Oxidation, Chemical reactions, Chlorination, Domestic wastes, *Waste water treatment, Effluents.

A New York City treatment facility was the site of a demonstration project for the disinfection of secondary effluent by ozone. Influent at the plant was of domestic origin. A disinfection level of 200 fecal coliform/100 milliliters was obtainable with an ozone dose of 1.75 milligrams/liter and a contact time of 3.5 minutes. The holding time was 10 minutes. Holding times were critical with low ozone doses because disinfection continues throughout that period. Costs should be reduced with low dose disinfection. Tests indicated that the performance of a well-designed diffusion system was equal to or better than a positive pressure injection or mechanical mixing system. Most disinfection occurred during the first four minutes of contact time when more than 2.5 ppm of ozone was present. Doses of less than 1.5 milligrams/liter were insufficient. Doses of 1.75 milligrams/liter with a 10-20 minute holding time produced the required disinfection. Most additional disinfection occurred during the first 10 minutes of holding time and little additional activity was found after 20 minutes holding time. Nearly complete destruction of fecal coliform was obtained with a 3.5 milligram/liter ozone dose and a 20 minute holding time. Increasing COD in a range of 22-34 milligrams/liter slightly reduced disinfection. Disinfection was also inhibited when suspended solids were increased in the range of 6-16 milligrams/liter. The quality of the influent waste water probably contributed to the success of these low doses. Further testing should be conducted to determine other influential factors. The availability of ozone for disinfection is determined by water ozone demand and chemical oxidation reaction rates. Other factors may include bubble size, diffuser pore size, water pressure, and surface tension. An economical approach to ozone usage might be the design of systems to allow the alternative of either ozone or chlorine disinfection. (Collins-FIRL)

SLUDGE TREATMENT: PROBLEMS AND SOLUTIONS, PART 1,
National Environmental Research Center, Cincinnati, Ohio. Advanced Waste Treatment Research Lab.
J. E. Smith, Jr.
Water and Sewage Works, Vol. 124, No. 4, p 80-83, April, 1977. 5 fig, 7 tab.

Descriptors: *Sludge treatment, *Biological treatment, *Heat treatment, Anaerobic digestion, Aerobic treatment, Pathogens, Microorganisms, Dewatering, Filtration, Drying, Sludge disposal, Landfills, Incineration, Pollutants, Suspended solids, Biochemical oxygen demand, Heavy metals, *Waste water treatment.

Stricter waste water treatment effluent standards are expected to double secondary treatment sludges by 1985, and chemical sludges are expected to be produced in large quantities. Problems and suggested solutions were considered for future sludge treatment. The major concern is to evaluate process alternatives, to eliminate inappropriate methods, and to produce a total system of treatment. Various processes considered were sludge thickening, heat treatment, sludge conditioning, dewatering and filtration, and drying. Disposal techniques, such as landfilling and applying sludge agriculturally, were discussed. Mechanisms, chemical treatment, and resource recovery involved in municipal and various industrial sludge treatment procedures were evaluated. (Collins-FIRL)

INSTRUMENTATION IMPROVES WASTE WATER TREATMENT PLANT CONTROL,
Rochester Water Reclamation Plant, Minn.
M. T. Skodje.
Public Works, Vol. 108, No. 4, p 88-90, April, 1977.

Descriptors: *Instrumentation, *Treatment facilities, *Monitoring, Equipment, Operation maintenance, Temperature, Dissolved oxygen, Sludge treatment, Analysis, Waste water treatment, Minnesota, Biological treatment.
Identifiers: Rochester(MI).

Research and pilot tests have resulted in more accurate design relationships for biological treatment processes. For these processes, such as trickling filter and activated sludge treatment, design formulas involve dissolved oxygen uptake rates, mixed liquor suspended solids, waste sludge concentrations, sludge wasting rates, return sludge concentrations, and sludge return rates. The operator can be aided by instrumentation which allows either rapid tests or continuous and reliable monitoring. Instrumentation testing has been undertaken by a Rochester, Minnesota, treatment plant for its expansion program. Fixed-probe dissolved oxygen meters and sonic sludge density controllers were tested. The plant contained parallel, rectangular plug-flow aeration tanks followed by circular clarifiers with peripheral feed and effluent collectors. Sensors were placed in the peripheral inlet channel of the clarifier, adjacent to the aeration tank inlet pipe, to obtain steady readings. These readings provide a correlation between inlet channel readings and desired aeration tank DO levels. Performance was very acceptable and cleaning of membrane surfaces and calibration were simple operations. Membrane replacement was not needed more than twice during the first year's operation. The sludge density controllers measured the absorption of sound waves transmitted across the pipe diameter. Installation was in a pipe line common to the primary tanks, where a mixture of primary and waste activated sludge was received. A shutdown control was set at a sludge density of 2.5%. A delay switch allowed up to 30 minutes pumping to clear the pipe of dilute sludge before the density unit would take control. The unit was reliable, but one with a visual indicator improved the instrument's value by inducing operator interest in its operation. So far only weekly flushing has been required for maintenance. Operation efficiency was greatly improved with these instruments. (Collins-FIRL)

RATIONAL DESIGN OF AEROBIC DIGESTION SYSTEMS,
Clemson Univ., S.C. Dept. of Environmental Systems Engineering.
L. G. Rich.
Water and Sewage Works, Vol. 124, No. 4, p 94-95, April, 1977. 1 fig, 1 tab, 2 ref.

Descriptors: *Aerobic treatment, *Design criteria, Suspended solids, *Biodegradation, Microorganisms, Biological treatment, Oxygen demand, Sludge digestion, Solid wastes, Temperature, Activated sludge, *Waste water treatment, Analysis.
Identifiers: *Aerobic digestion.

Equations were presented for various aspects of the design of aerobic digestion systems. The process is used to stabilize organic solids for discharge to the environment by converting the biodegradable-solids fraction to carbon dioxide, ammonia, and water. Operation may be carried out in three modes: batch, semi-continuous, and con-

tinuous. In the first, solids are aerated for the entire stabilization period, aeration is ended, and supernatant and settled solids are discharged. Aeration is discontinued more frequently in the second method, permitting solids settling, partial solids withdrawal, and the addition of new solids. The third mode is carried out in a single or multi-stage form. The addition of a clarifier-thickener after digestion is not generally feasible with the continuous-flow, multi-stage system. Hydraulic retention time should be based on average air temperatures for the coldest month. Diffused-air aeration systems contribute to temperature stability. The equations provide means for determining the relationship of specific oxygen uptake rate, temperature, biodegradable-to-nonbiodegradable volatile suspended solids ratio in the initial suspension, and the mean solids age. These are useful for a fundamental and predictable specification of the degree of stabilization. (Collins-FIRL)

NEW DIRECTIONS IN ION EXCHANGE,
Water Purification Associated, Cambridge, Mass.
C. Calmon, and H. Gold.
Environmental Science and Technology, Vol 10, No 10, October 1976, p 980-984, 2 fig, 3 tab, 5 ref.

Descriptors: *Ion exchange, *Reverse osmosis, Electrodialysis, Capital costs, Operating costs, Desalination, *Waste water treatment.
Identifiers: *Sirotherm process, *Materials recovery, Regenerants.

Two ion exchange processes have recently been applied on a commercial scale that eliminate the need for regenerant chemicals, while minimizing the quantity of dissolved salts in the effluent waste stream, or substantially reduce the quantity of regenerants, making it easier to recover the contaminante ions. The Sirotherm process can reduce dissolved salts by 80%. It does not require expensive regenerating chemicals, consumes small amounts of energy, and can be easily scaled up to larger units. Within certain limits, the process is competitive with reverse osmosis and electrodialysis. Performance data and the capital and operating costs for three typical installations are presented. Specific ion exchanges that are capable of reacting with specific ions in solution are discussed. The new exchangers make possible: the recovery of a specific material through the removal of trace contaminants from valuable chemical baths; the recovery of valuable materials present in trace amounts in solutions or rinses; the removal of toxic ions below their solubility limits as insoluble salts; an increase in the amount of water that can be treated for a fixed amount of ion exchanger; and a decrease in the chemical regenerant usage and in the amount of regenerant waste. MAKE MONEY BY COMPUTER,
E. Watkins, and J. Burger.
The American City and County, Vol 92, No 4, p 57-58, April, 1977.

Descriptors: *Computers, *Costs, *Monitoring, Operating costs, Maintenance costs, Evaluation, Equipment, Cities, Water districts, Water quality control, Treatment facilities, Water rates, Waste water treatment, Florida.
Identifiers: Melbourne(FL).

Computerization was the solution to sewage collection problems created by the merger of Eau Gallie and Melbourne, Florida. Difficulties included meeting EPA regulations, conveying sewage in a level terrain to two treatment plants, and monitoring sealed overflow pipes on lift station wet wells. The computer used remot terminals at lift stations and distant treatment plants, and telemetric reports on operational and emergency conditions. Lift station terminals monitor water levels and control pump activity. Power failures and maintenance operations are also monitored. Infiltration/inflow data are collected to aid evaluation of future expansion needs. Operation and maintenance costs have been reduced and rate increases have been avoided by the installation of this system. A computerized billing system also reduced cost and billing errors. Descriptors: *Colorado, Water utilization, Domestic wastes, *Waste water treatment, *Domestic water, *Waste identification, Septic tanks, *Water reuse, Waste disposal, Separation techniques.
Identifiers: Gray water treatment, Aerobic home sewage treatment units, Evaporation-transpiration beds, Home water reuse.

Disposal of wastewater from isolated homes in mountainous and rural locations in Colorado presents unique and difficult problems. The purpose of the study was to evaluate the flow and pollution patterns from individual homes and to evaluate existing and potential treatment methods. Field evaluation of home wastewater flow and pollutional characteristics was accomplished. The average per capita water use in the home was 44.4 gallons per day and the waste strength was 0.11 pounds per capita per day of BOD per person. Data for individual fixtures and appliances were obtained with measurement of many pollutional parameters. A brief evaluation of the home treatment methods was accomplished. Laboratory bench scale studies were made to evaluate methods for treatment of the soap related wastes in the home for reuse as toilet flushing water. (Bennett and Linstedt - Colo)

Journal of the Environmental Engineering Div sion, Proceedings of the American Society of Civ Engineers, Vol. 102, No. EE5, Proceedings pap No. 12474, p 1087-1106, October 1976. 8 fig, tab, 7 ref. EPA 68-01-0183.

Descriptors: *Waste water treatmen *Centrifugation, *Lime, *Dewatering, Cost anal sis, Economic efficiency, Evaluation, Equation Treatment facilities, Size, Sludge, Sludge trea ment, Filtration.
Identifiers: *Vacuum filtration, *Alums.

The efficiency and the cost of dewatering lim and alum-generated physical-chemical treatme sludge were developed utilizing a continuo vacuum filter and a solid bowl conveyor ce trifuge. Centrifugal dewatering included evalu tion of both single-stage and two-stage classific tion dewatering. The evaluation of the da showed that lime recovery was economical wi both a single and two-state centrifugal as well vacuum filter above the plant size of 25,000,0 gal/day. Tables show the comparative cost of d watering the lime and alum sludges for vario sizes of treatment plants and with costs itemize for capital and operating considerations. Vacuu filters are the least-cost approach based on t results of the field studies. The paper also sho the process effects of varying operating param ters for these centrifuge and vacuum filter oper tions. (Bell-Cornell)

Journal of the Environmental Engineering Div sion, Proceedings of the American Society of Civ Engineers, Vol 102, No EE5, Proceedings pap No 12460, p 1005-1018, October 1976. 8 fig, 4 tab 28 ref.

Descriptors: *Sewage treatment, Treatment facil ties, *Trickling filters, *sludge disposal, *Sludg treatment, *Activated sludge, *Waste water trea ment, Water quality control, Hydraulics Biochemical oxygen demand, Effluents.

Activated sludge processes were used on a pilo plant scale as a means of upgrading trickling filte plants treating domestic wastewater. Parallel us of units provided increased hydraulic capacity an produced effluent BOD concentrations con sistently below 25 mg/l. Series activated sludge trickling filter or trickling filter-activated sludg processes produced effluent BOD consistentl below 15 mg/l. This performance was maintaine in all cases when operating at organic loadings u to about 50 lb BOD/day/1,000 cu ft (0.80 kg/day/m 3) of treatment unit volume. (Bell-Cornell)

ROLE OF NITROGEN IN ACTIVATED SLUDGE PROCESS,
ittsburgh Univ., Pa. Dept. of Civil and Environmental Engineering.
. C. Wu.
ournal of the Environmental Engineering Division, Proceedings of the American Society of Civil Engineers, Vol 102, No EE5, Proceedings paper No 12454, p 897-907, October 1976.

Descriptors: *Activated sludge, *Waste water treatment, *Water pollution control, *Chemical oxygen demand, *Biochemical oxygen demand, Nitrogen, *Sludge disposal, Proteins, Carbohydrates, Phosphorus, Respiration, Kinetics, Equations.
Identifiers: Oxygen utilization.

Study of the effect of nitrogen limitation on metabolic activities of activated sludge has been conducted by utilizing a completely mixed continuous flow bench-scale activated sludge unit. The system was operated at various dilution rates with and without cellular recycle and was maintained at a constant temperature, 26 plus on minus C, and pH of 6.5. The results show that the concentration of nitrogen in the feed will significantly affect the contents of sludge phosphorus, sludge protein, and carbohydrate, as well as the morphological configuration of sludge organisms. However, the results obtained from the system with cellular recycle show that the substrate utilization rate and sludge yield coefficient are independent of nitrogen concentration in the feed. The rate of oxygen utilization is higher in the nitrogen-rich activated sludge system than in the nitrogen-deficient activated sludge system, but the endogenous respiration rate constant is identical in both systems. (Bell-Cornell)
W77-08869

METHOD OF PURIFYING WASTE WATER,
Feldmuhle Anlagen- und Produktions-gesellschaft m.b.H., Duesseldorf-Oberkassel (West Germany). (Assignee).
T. Ploetz, U. Haupt, and E. Solich.
Patent No 3,998,730, 3 p, 5 ref; Official Gazette of the United States Patent Office, Vol 953, No 3, p 1153, December 21, 1976.

Descriptors: *Patents, *Waste water treatment, *Water quality control, *Organic wastes, Lignin, Industrial wastes, Hydrogen ion concentration, Separation techniques, Pulp and paper industry, *Pulp wastes.
Identifiers: Granular alumina, Aluminum ions.

The purification of waste water from lignin and its derivatives formed during the manufacture and processing of wood pulp, and particularly to an improvement in the purification of such waste water by contact with granular alumina is described. It has now been found that the loss of alumina into the purified water can be reduced sharply by mixing aluminum ions with the water prior to contact with the alumina at a pH not greater than 7 at which the aluminum ions are soluble in the water. When aluminum ions are added to the waste water prior to contact with the alumina, the capacity of the alumina is enhanced and its dissolution is repressed. The aluminum ions are mixed with the waste water preferably in the form of the aluminum salts of acids strong enough to lower the pH of the waste water. The waste water purified by this method may still contain formic acid, acetic acid, and monosaccharides which are readily decomposed by conventional exposure to microorganisms. (Sinha-OEIS)
W77-08881

METHOD FOR PURIFYING WATER OF ORGANIC COMPOUNDS NOT READILY BIODEGRADABLE,
Feldmuhle Anlagen- und Produktions-gesellschaft m.b.H., Duesseldorf-Oberkassel (West Germany). (Assignee).
H. Solbach, and H. Foerster.
U.S. Patent No. 3,998,732, 7 p, 2 fig, 1 tab, 2 ref; Official Gazette of the United States Patent Office, Vol 953, no 3, p 1153, December 21, 1976.

Descriptors: *Patents, *Waste water treatment, *Organic wastes, *Water purification, *Pulp wastes, Water pollution sources, Lignins, Absorption, Pulp and paper industry.
Identifiers: Alumina grains, Al203.

This invention relates to the purification of waste water, and particularly to the removal of organic compounds which are not readily bio-degradable from water by adsorption on granular forms of Al203. For adequate contact of the waste water with a sufficient amount of alumina grains, it is necessary to employ a multiplicity of adsorption columns in which a maximum concentration ratio of granular alumina to water must not be exceeded. Because of the turbulence which keeps the granular adsorbent in suspension, it is not possible to hold the alumina grains in a fixed position. The selected grain size of the porous alumina is essential for successful operation of the method of the invention because it avoids clogging of the passages between the grains, yet still provides an adequate adsorbent surface. The flow velocity at which the waste water to be purified is passed through an adsorbent column has a major influence on the effectiveness of the process. The contact between the water to be treated and the alumina grains is to be maintained for 30 minutes to 2 hours and the contact time varies with the nature of the waste water.
W77-08883

METHOD AND APPARATUS FOR PURIFYING AQUEOUS STREAMS CONTAMINATED WITH ORGANIC MATERIALS,
BASF Wyandotte Corp., Mich. (Assignee).
K. K. Ladha, W. M. Herring, and J. F. Louvar.
U.S. Patent No. 4,000,065, 13 p, 3 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 953, no 4, p 1609, December 28, 1976.

Descriptors: *Patents, *Waste water treatment, Water pollution control, *Water purification, Water quality control, *Organic wastes, *Reverse osmosis, Separation techniques, Pressure, Equipment, *Filtration.
Identifiers: *Ultra-filtration.

Aqueous streams contaminated with minor amounts of organic materials are separated into an aqueous fraction which is concentrated with respect to the organic contaminants and a water fraction relatively free of the organic contaminants by a method which includes a combination of reverse osmosis (RO) and ultra-filtration (UF). The organic contaminants include substances having molecular weights of less than 10,000 which are soluble in the aqueous stream initially but have limited solubility ranges and are precipitated upon concentration. The contaminated aqueous stream is circulated from the high pressure compartment of a RO unit to the high pressure compartment of an UF unit, then to the low pressure compartment of the UF unit, and then back to the high pressure compartment of the RO unit. The contaminants are concentrated in the high pressure compartment of the RO unit, and a portion of it is precipitated or otherwise rendered amenable to removal along with the UF concentrate upon passing the RO concentrate from the high pressure compartment of the RO unit to the high pressure compartment of the UF unit. Soluble organic contaminants remaining in the aqueous stream are removed in the UF permeate and are recycled back to the high pressure compartment of the RO unit for further concentration and precipitation, followed by recycling to the high pressure compartment of the UF unit for removal. (Sinha-OEIS)
W77-08889

POLLUTED WATER PURIFICATION,
Phillips Petroleum Co., Bartlesville, Okla. (Assignee).
W. T. Nelson, and H. D. Holtz.
U.S. Patent No. 4,000,068, 4 p, 3 tab, 5 ref; Official Gazette of the United States Patent Office, Vol 953, no 4, p 1611, December 28, 1976.

Descriptors: *Patents, *Waste water treatment, *Water pollution treatment, Water quality control, *Water purification, Organic wastes, Chemical wastes, Industrial wastes, *Oxidation.
Identifiers: Cupric nitrate.

A process is provided for converting water contaminated with organic materials to a potable aqueous product by contacting contaminated water under oxidation conditions with a water soluble copper salt such as cupric nitrate under conditions sufficient to convert the organic materials to innocuous materials so that the aqueous stream which has been substantially freed of contaminating materials can be safely discarded or reused. The water soluble copper salt catalyst of the invention is cupric nitrate. The process of the invention can be carried out under a variety of conditions depending upon the feedstock, cupric ion concentration, temperature, desired degree of organic removal, and other conditions. (Sinha-OEIS)
W77-08890

METHOD FOR PURIFYING WASTE WATERS WHICH CONTAIN ANIONIC-TYPE ORGANIC COMPOUNDS,
Anic S.p.A., Palermo (Italy). (Assignee).
R. Fusco.
U.S. Patent No. 4,000,069, 3 p, 4 ref; Official Gazette of the United States Patent Office, Vol 953, no 4, p 1611, December 28, 1976.

Descriptors: *Patents, *Waste water treatment, *Water treatment, Water quality control, *Water pollution treatment, Organic wastes, Chemical precipitation, Dyes.
Identifiers: Bis-triarylphosphonium, Textile industry.

A method for the purification of waste water which contains organic compounds of an anionic nature exploits bis-triarylphosphonium salts. With the use of salts of bis-triarylphosphonium saline compounds are formed, which are very poorly soluble, with organic compounds of an anionic nature, the latter being thus quickly precipitated. The salts in question supply very poorly soluble saline compounds with numerous classes of dyes, provided that the latter possesses one or more sulphone groups in their molecules. This property can be exploited to precipitate, and thus to strip the dyes from the residual dyeing baths, especially when the dyestuffs in question cannot be stripped with the conventional organic precipitants. PLANT SIZE INFLUENCE ON PERFORMANCE IN ACTIVATED SLUDGE SYSTEMS WITH AP-

PLICATION TO REGIONAL WASTEWATER TREATMENT PLANNING,
California University, Davis, Department of Civil Engineering.
T. R. Grovhoug.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-268 983, Price codes: A04 in paper copy, A01 in microfiche. Master of Science Thesis, (1973). 50 p, 6 fig, 9 tab, 18 ref, append. (California Water Resources Center Project UCAL-WRC-W-476). OWRT B-173-CAL(1).

Descriptors: *Waste water treatment, *Sludge treatment, *Economic efficiency, Management, *Activated sludge, *Treatment facilities, Regional analysis, *Performance, *Planning.
Identifiers: *Regional wastewater treatment.

Plant performance data from 30 existing activated sludge plans of varying size were evaluated to determine the relationship between plant performance and plant performance stability as a function of plant size using effluent suspended solids concentration as a measure of plant performance and variability of effluent suspended solids concentration as a measure of performance stability. Judgment of the superiority of single, large plant or grouped, small plant systems was made based on these results. Following the data analysis portion of the study, a further comparison of single plant vs. multiplant wastewater treatment systems was made based on economic and operational considerations to serve the second purpose. The following conclusions may be made based on the results, (1) No relationship exists between plant size and plant performance for the plants studied. (2) Single plant treatment systems exhibit no apparent advantages over multiplant treatment systems. (3) Research is needed to evaluate performance capabilities of existing treatment systems. (4) A greater understanding of regional wastewater treatment management considerations should be obtained before further regional systems are developed. (Snyder-California, Davis).

ENZYMATIC TREATMENT OF DAIRY EFFLUENTS,
Nebraska Univ., Lincoln. Dept. of Food Science and Technology.
P. J. Bailey.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-268 980, Price codes: A05 in paper copy, A01 in microfiche. M.S. Thesis, June 1977. 82 p, 10 fig, 21 tab, 67 ref. OWRT A-040-NEB(2). 14-34-0001-7058.

Descriptors: Water quality, Effluents, Water pollution, Enzymes, *Waste water treatment, *Dairy industry, Industrial wastes, Biodegradation, *Biochemical oxygen demand, Biological treatment.
Identifiers: *Enzymatic treatment.

The purpose was to examine waste from a local multi-purpose dairy for compositional analysis and organic strength and to apply enzyme technologies to achieve reduction in the BOD of dairy waste. Prior to the studies with enzymes, wastewater from a local dairy was collected, and its proximate composition was determined. Those effluent constituents which were found to contribute the greatest amount of BOD were chosen for enzymatic pretreatment. It was felt that specific enzymatic pretreatment of certain effluent constituents might reduce the BOD of dairy wastewater and thereby reduce the stress on sewage treatment facilities. It was concluded that the enzymatic prehydrolysis of effluent constituents did not lower the BOD or the COD of dairy wastewater and did not increase BOD removal efficiencies in an activated sludge plant; however, the enzyme lactose dehydrogenase would decrease the BOD and the COD of lactose, a major component of dairy wastewater.

REAL-TIME MEASUREMENTS OF AQUATIC NITROGEN,
Connecticut Univ., Storrs.
J. S. Mazurek.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-269 182, Price codes: A04 in paper copy, A01 in microfiche. Master of Science Thesis, 1975. 48 p, 15 fig, 1 tab, 36 ref, 2 append. OWRT A-030-CONN(6), 14-31-0001-3007.

Descriptors: *Waste water treatment, *Sewage treatment, *Instrumentation, *Nitrogen compounds, Activated carbon, Anion exchange, Cation exchange, Nitrates, Ammonia, *Measurement, Pilot plants, Treatment facilities, Pollutant identification.
Identifiers: Real-time measurements, *Aquatic nitrogen, Model pilot treatment plant, Total nitrogen.

This research involves real-time measurements of aquatic nitrogen utilizing a nitrate (NO3(-)) probe, an ammonia (NH3) probe and a pyrolysis/microcoulometric total nitrogen (TN) analyzer. Organic nitrogen can be estimated by difference (Org N) = (TN) - (NO3(-)) - (NH3). The objectives are to evaluate the measurement system for real-time determination of aquatic borne nitrogen and to learn the nitrogen removals and interactions within a model pilot sewage and advance treatment plant. Utilizing the mentioned instrumentation, real-time measurements were obtainable within 15 minutes but when the sensitivity levels of the instruments are approached and relative errors increase, misleading estimations of organic nitrogen can occur. From statistical analysis (and % removal - % relative error) of data it is concluded that nitrogen is removed by secondary treatment /at least 18% to 28%/, by activated carbon /17% to 27%/, by anion exchange /1%/, and by cation exchange /10% to 25%/; nitrates are removed by anion exchange /13%/ and ammonia by cation exchange /20% to 38%/. The concept of real-time analysis is feasible and practical only after the causes of errors are quantitated and minimized. (de Lara-Conn)
W77-09095

PHOSPHATE AND NITRATE REMOVAL BY A GRASS FILTRATION SYSTEM FOR FINAL TREATMENT OF MUNICIPAL WASTE WATER,
Pennsylvania State Univ., University Park. Dept. of Agricultural Engineering.
J. N. Walter.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-269 171, Price codes: A04 in paper copy, A01 in microfiche. Master of Science Thesis, August 1974. 57 p., 16 tab., 3 fig., 29 ref., append. OWRT B-054-PA(2), 14-31-0001-3931.

Descriptors: *Overland flow, *Waste water treatment, Seasonal, Effluents, Phosphates, Nitrates, Municipal wastes, Municipal water, *Filters, *Filtration.
Identifiers: *Grass filtration system, *Nitrate removal, *Phosphate removal, Waste water systems, Flow distance, Application frequency, Long contact time.

Effects of application rate, flow distance, and seasonal changes on phosphate and nitrate removal were evaluated. The higher rates of application had lower nutrient removals. The longer distances produced high degrees of renovation. Different seasons produced variations in treatment effectiveness because the hydrologic characteristics of the soil changed. Both phosphate and nitrate removals were low. The lower application rates and longer flow distances removed the greatest amount of phosphate; however, all of the phosphate removal values were low due to the short contact time with the soil. Nitrate removals were low because the well-drained soil on which the study was conducted prevented anaerobic conditions necessary for denitrification. The Winter series had more nearly impervious soil conditions than the other three. The most important finding was that for a Northeastern, moderately to well-drained soil, overland flow treatment, as conducted in this experiment, was not effective. The removal efficiencies obtained are not sufficiently high to warrant installing systems of this type. (Sink - Penn State)

SLUDGE DISPOSAL IN THE NORTH WEST,
G. L. Symes, and A. P. Michaelson.
Water Pollution Control, Vol. 76, No. 1, p 50-58, 1977. 1 fig, 3 tab, 9 ref, 1 append.

Descriptors: *Sludge disposal, *Irrigation, Equipment, Planning, Analysis, Treatment facilities, Waste water treatment, Disposal, Land reclamation, Water districts.
Identifiers: North West Water Authority(England), Ocean disposal, Marine sanitation.

Sludge disposal in areas controlled by the North West Water Authority, England, was discusses. The most common method is disposal to agricultural land. Seventy-five percent of the treatment plants supply liquid sludge for this purpose. Transport is accomplished by road tankers discharging sludge through irrigation pipes and rain guns, fixed pipes laid beneath fields, and slurry tanker disposal. Disposal to lagoons and tips is declining. Raw sludge is mixed with bulk transported refuse, in one case, to form stable lagoons which, when dry, aid land reclamation. Ocean disposal is carried out by pumping to an outfall and by ship transport. One major problem is that of sludge disposal in the Greater Manchester area. Planning and investigative groups are presently devising schemes to alleviate this problem. (Collins-FIRL)

EWAGE SLUDGE INCINERATION SHOULD E IMPROVED BY ADDITION OF NEWSPRINT ULP.
Vater and Pollution Control, Vol 115, No 4, p 54-5, April, 1977.

Descriptors: *Incineration, *Pulp wastes, *Waste isposal, Performance, Equipment, Fuels, Vacuum filters, Municipal wastes, Flocculation, Polyelectrolytes, Testing, Waste water treatment, Cities, *Canada.

ncreased treatment plant size, treatment cenralization, and the growing lack of landfill areas ave increased investigations into using incinerain for sewage disposal in Canadian municipalies. The addition of pulped newsprint to sludge hould provide several benefits. A drier cake with ess than a 70% water content should result in fuel avings of about 50%. The newsprint fibers, mounting to 10% of cake weight, can act as fuel o reduce supplemental fuel source needs. Replacng lime with newsprint pulp would aid vacuum filration and eliminate lime scale on pipes, equipnent, and tanks. A pulper and a press would be the nly added equipment necessary, and the $160,000 osts could be repaid in two years through fuel avings. A low-cost newsprint source would be ecessary; a domestic newspaper collection cheme was proposed as one way to obtain a ewsprint supply. Field tests were conducted to stablish the best proportions of newspaper pulp o sludge ratio, and to determine the best polyelectrolyte to use as a flocculant before vacuum filtraion. Other studies showed that sludge dewatering roduced a sludge cake suitable for pressing. Fullscale testing of the process is currently underway. (Collins-FIRL)

COMPOSTING DESTROYS PATHOGENS IN SEWAGE SOLIDS,
Johns Hopkins Univ., Baltimore, Md. Dept. of Environmental Health.
K. Kawata, W. N. Cramer, and W. D. Burge.
Water and Sewage Works, Vol. 124, p 76-79, April, 1977. 6 fig, 13 ref.

Descriptors: *Pathogenic bacteria, *Viruses, *Aerobic treatment, Temperature, Water purification, Bacteria, Growth rates, Nutrients, Waste disposal, *Sewage treatment, *Waste water treatment.
Identifiers: *Composting.

Composting can be most effective in the destruction of pathogens. Various past and present studies were used to describe the development of composting from its embryonic stages to its immediate state of usage. Many of the less industrialized nations have long used composting. Recently it has gained wider interest among the more industrialized, urbanized nations for their waste disposal programs. The most important factor in pathogen destruction by composting is the maintenance of temperature throughout the compost mass which will inactivate the organisms. In recent studies, Salmonella newport, Candida albicans, Ascaris lumbricoides, and poliovirus I were seeded in dewatered sludge. Results of activity in a fully aerobic and completely mechanized plant showed substantial organism reduction. Salmonella was inactivated at 60 C in 30 minutes, Candida at 70 C in 60 minutes, Ascaris at 60 C in 60 minutes, and poliovirus at 50 C in 30 minutes. Outdoor composting in windows produces a pile with a temperature similar to ambient temperature, although it can rise to 70 C in the center of the pile. The pathogens are destroyed deeper in the pile, but survive on the pile surface. Evidence suggested that there is a temperature zone at which bacterial growth is optimum. This growth may continue as long as proper nutrients are available. It was shown that some pathogens survive waste water treatment and are included in waste solids. Composting has been shown to be a good option for waste disposal and destruction of these pathogens. (Collins-FIRL)

SLUDGE INCINERATION,
J. Jacknow.
Environmental Science and Technology, Vol 10, No 12, November 1976, p 1080-1082, 1 tab, 6 ref.

Descriptors: *Incineration, *Sludge disposal, *Environmental effects, Heat budget, Pesticides, Pathogenic bacteria, Viruses, Waste treatment, Waste disposal.
Identifiers: *Energy conservation, Land disposal, Heat balance, Energy costs, Health costs.

A synopsis of alternative sludge disposal techniques and their environmental impacts is presented by a consultant to the Water and Wastewater Equipment Makers Association. Energy saving systems in use today are discussed. Many present sludge incineration systems are meeting local and state particulate standards, which are more stringent than Federal standards. Mercury and lead are discharged, but at insignificant levels. Pesticides present in the sludge are destroyed in the incineration process at efficiency rates of between 94 and 99.9 percent. A process is discussed whereby the latent heat in incinerator flue gases is used to precondition sludge. This and other processes result in a positive heat balance in the incinerator that can be used to generate steam for other operations at the treatment plant. Twenty-five million BTU's per day can be recovered from an incinerator serving a community of 100,000 people. Incineration has been found to have fewer energy and health costs than land application. The ash from the incineration process is free from pathogens, viruses and pesticides. The metals in the ash have been converted to the less soluable oxide form. (Nessa-NC)

SOLID WASTE MANAGEMENT: A TEST OF ALTERNATIVE STRATEGIES USING OPTIMIZATION TECHNIQUES,
Rutgers - The State Univ., New Brunswick, N.J. Dept. of Geography; and Rutgers - The State Univ., New Brunswick, N.J. Div. of Urban Studies.
M. Greenberg, J. Caruana, and B. Krugman.
Environment and Planning A, Vol. 8, No. 5, p 587-597, August, 1976, 4 tab, 13 ref.

Descriptors: *Linear programming, *Solid wastes, *Waste disposal, *Domestic wastes, *Optimization, Analytical techniques, Systems analysis, Watersheds(Basins), Management, Incineration, Landfills, Energy, *New Jersey.
Identifiers: *Hackensack Meadowlands(NJ), Gas pyrolysis, Dry fuel technology, Fuel credits, Resource recovery, Energy recovery.

A linear program is developed that tests the efficacy of different solid waste disposal technologies, locations, and fuel credits for recovered energy. The research design focuses on the cost of continued centralized landfilling and the opportunity cost of choosing either dispersed landfilling or resource recovery strategies. Twenty-five watersheds in the Hackensack Meadowlands of New Jersey formed the geographical unit of analysis. Four disposal technologies were evaluated, including present practices, disposal at sites in other communities, dry fuel technology which recovers an energy by-product, and gas pyrolysis. High, medium and low revenue pictures were developed for the last two options in order to determine the threshold revenue at which the systems become economically feasible. A low price charged for use of a central site results in continuation of present practices. When costs rise 55 percent, pressures develop for alternative sites. A low revenue for recovered resources justifies at least one dry fuel plant. The optimization procedure assigns all of the region's wastes to dry fuel facilities when medium and high revenues are assumed. The gas pyrolysis system cannot compete economically with the dry fuel system at any fuel credit level. (Nessa-NC)

SOIL TESTING FOR SLUDGE DISPOSAL.
Compost Science, Vol. 18, No. 1, p 16-17, January-February, 1977.

Descriptors: *Sludge disposal, *Soil tests, Heavy metals, Fertilizers, Soil properties, Monitoring, Ultimate disposal, *Soil disposal fields, Soil analysis, Waste water treatment, Water reuse.

Graduate and undergraduate students at the Penn State School of Agronomy are investigating sludge disposal for agricultural use. Soil testing is part of their research. The method developed uses an ideal solution of macro elements in combination with a soil sample. The solution adds to the soil or adsorbs from it the basic elements needed for plant growth; excesses or deficiencies of these elements can be pinpointed by examination of the solution after it interacts with the soil. The type and amount of fertilizer needed to promote optimum growth can be determined, as can the presence of heavy metals in sludge fertilizer. Monitoring the use of sludge as compost will be much easier with these test methods. (Collins-FIRL)

Descriptors: Sludge disposal, Soil physical properties, *Heavy metals, *Sewage disposal, *Nitrogen, *Sewage effluents, *Sewage lagoons, Infiltration, Permiability, *Waste water disposal, Percolation, Water reuse, Absorption.
Identifiers: Fragipan soils, New England soils.

This project was initiated in response to a concern about the suitability of various sewage effluent land disposal alternatives; findings of Phase I of the dual phase project are presented. The sources of greatest concern include sewage effluents applied to land as a 'living filter' and sludge from wastewater treatment plants. The following papers are presented: (1) Measurement of the Infiltration Properties of Fragipan Soils; (2) Experimental Study of Waste Effluent Infiltration through Soil Media; (3) Heavy Metal Reactions in Soils; (4) Modeling of Plant Uptake of Nitrogen; (5) Mathematical Modeling of Nitrification/Denitrification in a Wastewater Storage Lagoon of a Spray Irrigation System; and (6) Nitrogen Transformations in Storage Reservoirs. Available from the National Technical Information Service, Springfield, VA 22161 as PB-269 093, Price codes: A07 in paper copy, A01 in microfiche. Massachusetts Water Resources Research Center, Amherst, WRRC Publication No. 86, December 1976, 134 p, 54 fig, 18 tab, 90 ref. OWRT B-038-MASS(1), 14-31-0001-5080.

Descriptors: Waste disposal, Sewage disposal, *Soil physical properties, Permeability, Sewage lagoons, *Waste water disposal, *Heavy metals, Water reuse, *Percolation, Soil engineering, *Nitrogen, Mathematical models, Sewage effluent.
Identifiers: New England soils, Fragipan soils, Land application.

This project was undertaken as a result of the controversy surrounding the disposal of treated waste effluent. Five papers are presented, each related to the fate of contaminants in a land disposal system operating on New England soils. Topics discussed are: (1) The distribution of fragipan soils in New England as well as the physical characteristics of these hardpan soils; (2) The reactions of heavy metals in wastewater applied to soils; (3) Nitrogen transformations in wastewater applied to soils; (4) A mathematical model related to nitrogen transformation during lagoon storage to help determine suitable loading rates in a land application system; (5) Utilization of a computer simulation of rainfall to investigate the importance of annual precipitation patterns in determining land application rates. STORAGE OF LOW-LEVEL RADIOACTIVE WASTES IN THE GROUND: HYDROGEOLOGIC AND HYDROCHEMICAL FACTORS,
Geological Survey, Reston, Va. Water Resources Div.
S. S. Papadopulos, and I. J. Winograd.
Open-file report 74-344, 1974. 49 p, 1 fig, 43 ref, append.

Descriptors: *Radioactive waste disposal, *Underground waste disposal, *Water pollution control, *Hydrogeology, Reviews, Methodology, Evaluation, Geologic units, Aquifers, Groundwater movement, Path of pollutants, Model studies, Mathematical models.

The status of mathematical simulation techniques, as they apply to radioactive waste burial sites, is briefly reviewed, and hydrogeologic and hydrochemical data needs are listed in order of increasing difficulty and cost of acquisition. Predictive modeling, monitoring, and management of radionuclides dissolved and transported by ground water can best be done for sites in relatively simple hydrogeologic settings; namely, in unfaulted relatively flat-lying strata of intermediate permeability such as silt, siltstone and silty sandstone. In contrast, dense fractured or soluble media, and poorly permeable porous media (aquitards) are not suitable for use as burial sites, first because of media heterogeneity and difficulties of sampling, and consequently of predictive modeling, and second, because in humid zones burial trenches in aquitards may overflow. A buffer zone several thousands of feet to perhaps several miles around existing or proposed sites is a mandatory consequence of the site selection criteria. As a specific example, the Maxey Flats, Kentucky low-level waste disposal site is examined. (Woodard-USGS)

INFLUENCE OF INITIAL MIXING ON DIRECT FILTRATION,
Illinois Inst. of Tech., Chicago. Dept. of Environmental Engineering.
R. R. Sama.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-268 907, Price codes: A05 in paper copy, A01 in microfiche. Master's Thesis, December 1974. 88 p, 24 fig, 7 tab, 30 ref. OWRT A-062-ILL(4). 14-31-0001-4013.

Descriptors: *Water treatment, *Flocculation, *Polyelectrolytes, Lake Michigan, *Mixing, *Filtration, Filters, Cations, Coagulation, Performance.
Identifiers: *Direct filtration, Organic polyelectrolytes, Mixing time, Filtration rate, Zeta potential measurements.

A literature review describes the history and development of direct filtration as a means for economical treatment of water with a low turbidity and compares the various procedures used. Experiments were conducted using a dual-media filter and a commercially available organic cationic polyelectrolyte coagulant. The primary objective was to study the effect of the mean fluid resident time and the mixing intensity in a continuous flow reactor on the length of the filter run. Polyelectrolyte concentrations of 2.0, 3.0 and 5.0 mg/l were used. Results are given for various operating conditions. At higher optimal values, the benefits resulting from increased deposit density are offset by increased deposition in the anthrocite-sand mixture region, when, because of the relatively lower initial porosity, deposition results in a relatively rapid head loss buildup and consequently shorter filter runs.

DIRECT FILTRATION OF LAKE MICHIGAN WATER,
Illinois Inst. of Tech., Chicago. Dept. of Environmental Engineering.
R. D. Tanner.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-268 890, Price codes: A05 in paper copy, A01 in microfiche. Master's Thesis, May 1974. 74 p, 23 fig, 11 tab, 21 ref. OWRT A-062-ILL(3), 14-31-0001-4031.

Descriptors: *Water treatment, *Flocculation, *Polyelectrolytes, *Lake Michigan, *Filtration, Filters, Colloids, Coagulation, Cations, Turbidity, Pilot plants.
Identifiers: *Direct filtration, Cationic polyelectrolytes, Zeta potential measurements.

A review of current theories concerning the mechanisms of colloid destabilization and filtration mechanisms is discussed, and finally the current application of direct filtration is reviewed. Two identical pilot plant filters were set up to evaluate the clarification of Lake Michigan water when cationic polyelectrolytes were used as the sole coagulant. One filter served as a blank, receiving only chlorinated water while the other filter received polymer treated water. During the test period the influent water turbidies ranged from 0.65 to 35 FTU. After 6.5 hours of filtration the effluent turbidity was less than 0.10 FTU. Four cationic polyelectrolytes were tested. The head loss developed during a filter run varied significantly between each of the polymers studied due

LIBRARY U. OF I. URBANA-CHAMPAIGN

to development of a filter cake by certain polymers. Head loss buildup was also a function of the influent turbidity and the polyelectrolyte concentration. It appears that direct filtration of Lake Michigan water with cationic polyelectrolytes as the sole coagulant might be a feasible alternative to the conventional water treatment plan. Additional research is needed when the turbidity is greater than 10 FTU.

PHOTOCHEMICAL DECHLORINATION OF WATER SUPPLY FOR FISH TANKS WITH COMMERCIAL WATER STERILIZERS,
Fisheries and Marine Service, Winnipeg (Manitoba). Freshwater Inst.
F. A. J. Armstrong, and D. P. Scott.
J Fish Res Board Can 31(12), p 1881-1886. 1974.

Descriptors: *Water treatment, *Chlorine, Fish, Habitats, Water supply.
Identifiers: *Dechlorination, Mercury, Lamp, *Photochemical, Dechlorination, Water, *Fish, Tanks, Chlorine removal.

Commercial Hg-lamp water sterilizers can be used for removal of free C12 in water supplies, by photochemical action. The efficiency of removal decreases with increasing pH, but is little affected by temperature. It is greatest at low initial C12 concentration. Equipment with either low or high presure Hg vapor lamps may be used. Removal of 90% of free C12 can be effected at about 13.01 min-1 with a sterilizer using 8 low presure lamps of 40 W, or at 50 1 min-1 or more with 2 1200-W sterilizers with high presure lamps in tandem. Treated water appears to be harmless to fish. -- Copyright 1977, Biological Abstracts, Inc.

PHILADELPHIA'S WATER SYSTEM AUTOMATION PLAN,
Philadelphia Water Dept., Pa. Office of Water Commissioner and Chief Engineer.
C. F. Guarino, J. V. Radziul, A. Hess, P. R. Cairo, and R. E. Day.
Journal of the Environmental Engineering Division, Proceedings of the American Society of Civil Engineering, Vol. 102, No. EE5, Proceedings paper No. 12473, p 953-968, October 1976. 6 fig, 7 ref.

Descriptors: *Water distribution(Applied), *Water quality, *Water treatment, *Automation, Computers, Design, Comprehensive planning, Rivers, Control, Treatment facilities, Algorithms.
Identifiers: *Information systems, Nomographs, Waterworks.

Described is the development of a five-year master plan to implement a modern integrated total system automation of the City of Philadelphia's water treatment and distribution facilities, including associated components. Analytical instrumentation and other devices located in the rivers, the treatment process, and the distribution system provide information through communication links to process control computers. The data are analyzed by the master control computer which utilizes specially derived algorithms to determine adjustments of chemical feeds and process flows via supervisory control of the plant's equipment. Examined is the multidisciplined approach taken to solve the problem. Considered are: a review of the treatment processes; strategies for improving treatment methods; the development of the five-level hierarchical control structure; and the derivation of advanced control strategies for computer-based process control and management. (Bell-Cornell)

5G. Water Quality Control

QUANTITATIVE AND QUALITATIVE IMPLICATIONS OF URBAN STORM RUNOFF ABATEMENT MEASURES,
Pennsylvania State Univ., University Park. Dept. of Civil Engineering.
G. Aron, D. A. Long, A. C. Miller, and M. J. O'Brien.
Available from the National Technical Information Service, Springfield Va as PB-268 777, Price codes: A06 in paper copy, A01 in microfiche. Research Publication 97, Institute for Research on Land and Water Resources, University Park, PA., December 1976. 101 p, 18 tab, 23 fig, 52 ref. 3 append. OWRT B-076-PA(2), 14-0001-5108.

Descriptors: *Planning, *Computer models, *Storm runoff, *Storm water, Surface runoff, *Urbanization, *Floods, *Urban drainage, *Urban hydrology, Urban runoff, Water quality, Management, Model studies.
Identifiers: *Urban runoff models, *Total watershed response, *Runoff quality, Subarea flow, Quantity of stormwater runoff, Hydrologic budget models.

Stormwater detention devices can be effective in reducing downstream problems as a result of urban development and they can be compatible with their surroundings. Problems can arise with stormwater detention devices especially if they are not constructed or maintained properly. Some devices are environmentally more acceptable than others in cerain areas, but there should be no problems which cannot be handled with adequate planning. Uraban runoff models are becoming more refined and reliable with use, but they still have a long way to go. They will, however, continue to be an important tool to the engineer and planner in the future. The decision-making process in regard to urban storm-water management and non-point source pollution control is severly hampered by the lack of good real-time data on both urban runoff quantity and quality. The present market demand for stormwater monitoring equipment has resulted in a desirable research effort into the development of more reliable equipment at lower cost. (Sink-Penn State)

ADVANCED WASTE TREATMENT DESIGN PROTECTS LAKE ALTON,
E. Maran, and D. J. Sulick.
Water and Sewage Works, Vol 124, No 4, p 68-69, April, 1977. 1 fig, 1 tab.

Descriptors: *Treatment facilities, *Water pollution control, Lakes, Activated carbon, Incineration, Biological treatment, Chemical treatment, Oxidation-reduction potential, Ammonia, Disinfection, Chlorination, Chemical reactions, Water purification, *Waste water treatment, *Tertiary treatment.
Identifiers: St Charles(MO), *Lake Alton(MO).

An advanced treatment system was used to produce a high quality effluent for discharge into Alton Lake, near St. Charles, Missouri. The lake was created by the construction of a flood control lock and dam on the Mississippi RIver, and is used for recreational purposes. The city's 5.5 mgd primary treatment plant was upgraded by the addition of activated sludge treatment and granular carbon adsorption. The entire system consists of a bar screen, comminutor, aerated grit chamber and primary clarifier, four aeration basins, and two secondary clarifiers. The sludge is thickened, filter pressed, and incinerated. Secondary clarifier effluent is pumped to the granular carbon system which functions as a suspended solids filter and adsorbs dissolved organic chemicals. The carbon life in each adsorber is about 200 days. The carbon is exhausted at a rate of nearly 200 pounds/miligram of waste water treated. Spent carbon is fed into a multiple hearth furnace operated at about 1650 F and fueled by natural gas or No. 2 fuel oil. The furnace has an afterburner and wet scrubber for complete organic matter combustion and removal of particulates from exhaust gases. Reactivated carbon is water-quenched and educted to an adsorber for reuse. A 5 to 7% carbon loss results from handling and reactivation. The design of the system provides for conversion of the plant to physical-chemical treatment in case of biological process failure. Chlorination is provided before and after carbon adsorption to reduce plugging of the carbon beds from the physical carryover of excess secondary slime growths, and to aid oxidation-reduction reactions of mono- or dichloroamines formed by free ammonia conversion at breakpoint chlorination. These reactions do not interfere with carbon adsorption properties. Carbon post-chlorination is for disinfection. (Collins-FIRL)

GET READY FOR DUAL WATER SYSTEMS,
Weston Environmental Consultants-Designers, West Chester, Pa.
A. K. Deb.
Water and Wastes Engineering, Vol. 14, No. 4, p 88-89, 91-92, April, 1977. 3 fig, 2 tab, 5 ref.

Descriptors: *Water supply, *Domestic water, Water quality control, Municipal water, Water consumption(Except consumptive use), Industrial water, Cities, Water use, Water purification, Water demand, Treatment facilities, Model studies, Costs, Recycling.
Identifiers: *Dual water supply systems.

Technological advances are increasing the probability of dual water systems and mathematical models have been developed for the costs involved in these systems. If the current rate of increased water demand, population growth, and development of chemicals which enter natural waters continue, the quality of water will decline and high quality supplies of domestic water will not remain at present levels. It is important to understand that a majority of water uses do not require the quality levels of potable water. It was suggested that a hierarchy of water use and relative quality levels be established. The supply of two or more water grades should be considered. Separate systems could be used to supply potable water and non-potable water. A higher quality level of water treatment, including disinfection, would be necessary for potable water, but non-potable water would receive treatment somewhat similar to present levels. Benefits would include lowered public health risks and water conservation. Dual systems are being used in various locales at present. An English system separates domestic (potable) and industrial (non-potable) water and, in Singapore, part of filtered waste water is used for industry and toilet flushing. A plan for St. Petersburg, Florida, would use reclaimed municipal water for lawn sprinkling. Non-potable water in dual systems should nevertheless be of such quality that accidental or inadvertent ingestion would not cause harm. (Collins-FIRL)

In: Thermal and Chemical Problems of Thermal Waters, Proceedings of the Grenoble Symposium, August/September, 1975. p 135-143, 1 fig, 2 tab, 19 ref.

Descriptors: *Geothermal studies, *Heated water, Powerplants, Agriculture, *Energy.

The rationale for agricultural applications of warm water appearing as waste heat from power generating plants or from geothermal waters is described. Because it is available over a wide temperature range, the use of geothermal water is identified as being particularly attractive. It was concluded that the use of warm water to satisfy existing and future energy needs should be developed. (See also W77-08677) (Chilton-ORNL)

Identifiers: Leachate collecting.

A system for collecting leachate at the bottom of a landfill site was conceptualized, and the design parameters for the system were specified. The core of the system is a sloped low-permeability earthen liner that deflects downward infiltration to a series of collector tiles. Equations were derived that describe the drainage and leakage processes on top of the leaky liner. A simple graphical procedure was developed to quantitatively evaluate the collection efficiency of the system. With the developed procedure, some implicatons of various options available to landfill design were examined. The main assumptions used in the model were examined critically to explain qualitatively the limitations of the model. (Sims-ISWS)

BARRIER FOR WATER CARRIED POLLUTANTS,
P. Preus.
U.S. Patent No 3,998,060, 6 p, 6 fig, 9 ref; Official Gazette of the United States Patent Office, Vol 953, No 3, p 934, December 21, 1976.

Descriptors: *Patents, *Oil pollution, *Water pollution control, Water pollution treatment, *Barriers, Floating, Obstruction to flow, Adsorption, Absorption.
Identifiers: Oleophilic-hydrophobic material.

Floating barriers, known generally as oil booms, are found to have great utility in containing and controlling oil slicks and other water carried pollutants on and in bodies of water. This barrier is composed of a series of boom sections which are connectable in end to end relationship with each of the boom sections containing a flotation material which comprises an oleophilic-hydrophobic-lighter than water composition which will selectively absorb and/or adsorb hydrocarbons or other pollutants. The boom sections are connected to flexible draft members such as cables or chains which maintain the integrity of the boom even if it becomes necessary to replace one or more of the boom sections or to enlarge the area confined by the boom or to decrease such area by removing boom sections. In addition to the flexible draft members and associated connectors, the invention provides for fluid impervious connectors which engage opposed boom section ends and prevent the escape of the contained floating substance at each joint or connection. (Sinha-OEIS)

P. M. Blanchard, and D. G. Meeks.
U.S. Patent No. 3,998,733, 5 p, 1 fig, 2 tab, 15 ref; Official Gazette of the United States Patent Office, Vol. 953, no 3, p 1153-1154, December 21, 1976.

Descriptors: *Patents, *Oil pollution, *Oil spills, Water pollution, *Water quality control, *Dispersion, Emulsions, Detergents, Organic compounds, Chemical reactions.

A dispersant composition can be dispersed in sea water at the time of spraying, the water acting as carrier. The dispersant composition can also be diluted with dearomatised kerosine. When the dispersant composition is to be diluted with sea water the composition can be sprayed from a vessel. When the composition is to be used to clear beaches it can be used dissolved in a suitably refined kerosine. Thus the composition can have a dual role. The detergent composition comprises an ester of a polyoxyethylene glycol ester of a C10-24 fatty acid, an organic sulphate or sulphonate deter-

PERMANENT U. OF I. URBANA-CHAMPAIGN

gent, an alcohol or glycol of molecular weight 90-250. (SinhanOEIS)

FENDING DEVICE FOR OIL CONTAINMENT BOOM,
E. C. Nielsen.
U.S. Patent No. 3,000,532, 7 p, 11 fig, 3 ref; Official Gazette of the United States Patent Office, Vol 954, no 1, p 108, January 4, 1977.

Descriptors: *Patents, *Oil pollution, *Oil spills, Water pollution, *Water pollution control, *Water quality control, Barriers, Equipment.
Identifiers: Fenders, Modular units, Containment.

Oil booms or barriers are in general use today for containing oil slicks floating on water. When oil booms are used in conjunction with vessels the boom must be held away from the hull of the vessel since a discharge from either above or below the waterline of the vessel will enter the plane of the water surface several feet away from the hull depending on the current and wind direction and velocity. The greater the distance of spacing of the boom, the better the likelihood of safe containment under most conditions. It is all imperative that the boom be kept away from the rotating propeller and destroyed with an attendant possibility of damage to the ship's propulsion gear. A durable fending device of suitable size for floating objects such as oil barriers is provided which has a maximum strength/weight ratio and is formed from a high strength material. It may be readily assembled from components of conventional shipping size by connecting them by standard fastening means into an efficient overall large span structure. (Sinha-OEIS)

SKIMMER FENCE,
Exxon Production Research Co., Houston, Tex. (Assignee).
U.S. Patent No. 4,000,618, 4 p, 8 fig, 7 ref; Official Gazette of the United States Patent Office, Vol 954, no 1, p 137, January 4, 1977.

Descriptors: *Patents, Water pollution, *Water pollution control, *Water quality control, Oil pollution, *Skimming, *Barriers, Baffles, Floating, Engineering structures.
Identifiers: Containment, *Skimmer fences.

A barrier for use in a flowing stream of liquid accumulates floating material including petroleum products so that such material can be easily removed. The barrier may be used as a safeguard in locations, such as ravines or drainage ditches, which are normally dry but which might occasionally contain a flowing stream. The apparatus is designed to skim or control a flowing stream which may vary in depth from very shallow to deep water. The barrier includes a series of vertically 'stacked' baffles. When in operating position the barrier extends across the breadth of the stream and to any desired distance above and below the surface of the liquid. The baffles are spaced apart with each baffle overlapping a portion of the baffle adjacent to it to form a passageway between each baffle for flow of the stream through the barrier. In cross section each baffle may comprise two straight members perpendicular to and extending in opposite directions to a third straight member or each baffle may comprise a semicircle in cross section. (Sinha-OEIS)

REMOTE SEALING OF MINE PASSAGES CONTAINING FLOWING WATER,
Department of the Interior, Washington, D.C. Office of the Secretary.
K. R. Maser.
U.S. Patent No. 4,000,621, 4 p, 3 fig, 7 ref; Official Gazette of the United States Patent Office, Vol 954, no 1, p 137, January 4, 1977.

Descriptors: *Patents, *Underground streams, *Subsurface water, *Mine water, Tunnels, Underground structures, Boreholes, Sealants.

There is often need to construct seals within underground passageways such as mine drifts or tunnels. Access to the seal site may be hazardous and often times impossible. This invention describes how a seal may be remotely constructed in an underground passage having water flowing by providing a diversion path for the water during construction of the seal and thereafter closing off the diversion path. This is accomplished by drilling at least one borehole communicating from the surface to the passage through which a first layer of sized aggregate is placed on the passage floor to allow percolation of the flowing water through the aggregate layer without water overflowing the layer. A dry sealing material, which may comprise fly ash alone or mixed with cement or a swelling clay such as bentonite, is then pneumatically placed on top of the aggregate layer. Then a cementitious grout is injected into the aggregate layer to close off the water flow path and complete the seal. (Sinha-OEIS)

FLOCCULANT USE ON TANKERS,
Exxon Research and Engineering Co., Florham Park, N.J. Environmental Control and Safety Div.
J. E. Shewmaker.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-251 626, Price codes: A03 in paper copy, A01 in microfiche. Report EE.5TMR.76 to U.S. Maritime Administration, March 1976. 48 p, 5 fig, 9 tab, 10 ref, 4 append. C-1-35049.

Descriptors: *Flocculation, *Water pollution control, *Oil pollution, *Pollution abatement, *Waste water treatment, *Separation techniques.
Identifiers: Tankers.

The results of shipboard studies of flocculants to improve oil-water separation in tanker slop tanks is presented. Experiments were performed in matched pairs of slop tanks. Montmorillonite clay in fresh water and a clay activator were mixed into the slop waters at levels of 100 mg/kg (ppm) and 20 mg/kg (ppm), respectively. Flocculation improved the oil-water separation at a very rapid rate. After the best method of application, flocculant-treated slop water contained about 20-50 mg/kg (ppm) of oil compared to several hundred mg/kg (ppm) in the control tank undergoing unaided gravity separation. Since flocculation would require supplying and handling of additional materials as well as operational effort, other methods of achieving oil-water separation may be preferred. Unanswered questions concerning flocculant use include the fate and effects of the clay and the economic recoverability of flocculated oil. (Sinha-OEIS)
W77-08906

A BIODEGRADATION OF OIL ON WATER SURFACES,
Office of Naval Research, Arlington, Va.
R. Bartha.
Available from the National Technical Information Service, Springfield, VA 22161 as ADA-000 722, Price codes: A02 in paper copy, A01 in microfiche. U.S. Patent Application No 558,040, 13 March 1975. 14 p, 1 fig.

Descriptors: *Oil spills, *Oil pollution, *Biodegradation, *Microbial degradation, *Water pollution treatment, Microorganisms, Patents.
Identifiers: *Outer Continental Shelf.

Free-floating oil slicks on bodies of sea and fresh water are disposed of by microbial degradation at a greatly enhanced rate by apply the essential microbial nutrients, nitrogen and phosphorus, to the oil slick in a form that dissolves in or adheres to the oil and thus selectively stimulates the activity of oil-metabolizing microorganisms. (Sinha-OEIS)
W77-08909

AGENTS, METHODS AND DEVICES FOR AMELIORATION OF DISCHARGES OF HAZARDOUS CHEMICALS ON WATER,
Rensselaer Polytechnic Inst., Troy, N.Y.
W. H. Bauer, and J. J. Bulloff.
Available from the National Technical Information Service, Springfield, VA 22161 as ADA-024 221, Price codes: A13 in paper copy, A01 in microfiche. U.S. Coast Guard Office of Research and Development Report No CG-D-38-76, August 1975. 285 p, 23 tab, 583 ref, 2 append.

Descriptors: *Oil spills, *Hazards, *Water pollution control, *Pollutant identification, *Water pollution treatment, *Oil pollutants, Waste disposal, Chemical wastes.

Chemical agents and methods advantageous for the amelioration of discharges of 30 representative hazardous chemicals on water were identified and evaluated. Existing devices advantageous for the amelioration of discharges on water of 8 floating hazardous chemicals were identified and evaluated. Sorbents that have a high potential to ameliorate discharges of 13 miscible/soluble representative hazardous chemicals were identified and evaluated. Experimental tests were performed. It was found that very few techniques have been established or tested for amelioration of discharges of hazardous chemical on water. Therefore, the identifications and evaluations of agents were based upon the known physical and chemical properties of the representative hazardous chemicals and of the applicable amelioration agents and upon recorded experience in treatment of polluted water, mill ponds, plant efflux, stream purification and oil pollution control methods. It was concluded that the use of chemical agents is feasible for 29 of the 30 representative hazardous chemicals and, by inference, to most of the CHRIS list of four hundred hazardous chemicals. The types of available agents evaluated to be most advantageous were sorbents, ion exchangers, diluents, neutralizers, collectors, precipitants, reductants, oxidizers and ultrafiltration membranes. It was further concluded that many available off-the-shelf devices with demonstrated capacity for usefulness in containing, gathering and removing oil spilled on water will also be advantageous in amelioration of discharges of floating hazardous chemicals on water. (Sinha-OEIS)

TESTS OF OIL RECOVERY DEVICES IN BROKEN ICE FIELDS. PHASE I,
ARCTEC, Inc., Columbia, Md.
L. A. Schultz, P. C. Deslauriers, R. P. Voelker, O. M. Halstad, and D. E. Abrams.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A016 465, Price codes: A05 in paper copy, A01 in microfiche. U. S. Coast Guard Office of Research and Development Report No. CG-D-130-75, July 1975. 92 p, 5 append.

Descriptors: *Oil spills, *Mechanical equipment, Ice cover, Arctic, Equipment, Oil pollution, Oil wastes.
Identifiers: *Oil recovery devices.

Full size tests of two oil spill recovery devices, the Lockheed Clean Sweep Model R2003 and the Marco Pollution Control Class I Oil Recovery System, operating in a simulated Arctic environment incorporating below freezing temperatures and ice infested waters in given in this final report. Tests were conducted with both devices in broken fresh water ice and salt water ice, with No. 2 diesel oil and a crude oil selected to closely match the properties of Prudhoe Bay crude oil, at temperatures of +25 F and +15 F. These tests demonstrated that with minor hardware modifications

and the proper operating procedures, both devices will successfully recover crude oil and No. 2 diesel oil spilled in a broken ice field of moderate ice-piece size. The unit oil recovery rate ranged from 1 to 10 gpm per foot of device width for the Lockheed device and from 2 to 25 gpm per foot of device width for the Marco device. (Sinha - OEIS)

SECTION 208 AND SECTION 303 WATER QUALITY PLANNING AND MANAGEMENT: WHERE IS IT NOW,
National Resource Defense Council, Washington, D.C.
D. L. Donley, and K. L. Hall.
Environmental Law Reporter, Vol. 6, p 50115-20, 1976.

Descriptors: *Federal Water Pollution Control Act, *Administrative agencies, *Comprehensive planning, *Water quality control, Governmental interrelations, Planning, Management, Legislation, Legal aspects, Regulation, Standards, Water quality, Water quality standards, Discharge(Water), Runoff, Degradation(Stream), Water pollution, Water pollution sources.
Identifiers: *Federal Water Pollution Control Act Amendments of 1972, *Environmental policy, Point sources(Pollution), Administrative regulations, National Pollutant Discharge Elimination System, Non-point sources(Pollution), Best management practices.

The Environmental Protection Agency (EPA) has substantially revised the regulation outlining the elements of water quality planning and management required by sections 208 and 303. The revised regulations call for a continuing planning process with provisions for periodic review and revision. Requirements for reformation of state antidegradation has also been added. Section 208, which addresses water quality problems from nonpoint sources, is being approached by requiring development and implementation of Best Management Practices (BMP). An appropriate BMP strategy would include proposed regulatory plans, management agencies, and projected costs. The water quality standard revisions pertaining to Section 303 have weakened the strong commitment to upgrading water quality standards to meet the 1983 goal. States may now downgrade existing water quality standards based on the concept of attainability which takes into account environmental, technological, social, economic, and institutional factors. However, the new antidegradation policy, if properly implemented, will protect high quality water from pollution and will curb current pollution. Only after public participation can a state qualify this regulation to allow for lower water quality. Public involvement is also seen to play a major role in both the planning and implementation stages of sections 208 and 303. (Petruff-Florida)

MANY CHANGES URGED FOR PL 92-500,
C. W. Heckroth.
Water and Wastes Engineering, Vol 13, No 3, p 34-39, March 1976.

Descriptors: *Federal Water Pollution Control Act, *Water Pollution Control Federation, *Governmental interrelations, *Administrative agencies, Administration, Government finance, Grants, Legal aspects, Water quality standards, Water law, Research priorities, Planning, Training, Effluents, Discharge(Water), Disposal, Oceans, Waste water(Pollution), Pre-treatment(Water).
Identifiers: *National Commission on Water Quality, *Federal Water Pollution Control Act Amendments of 1972, *Non-point sources(Pollution), PL 92-500.

Grievances against PL 92-500 were recently aired before the National Commission on Water Quality (NCWQ). The Water Pollution Control Federation (WPCF) recommended: (1) achieving the goals of the construction grants program through a federal funding commitment for the construction of municipal wastewater treatment facilities; (2) reconsidering the level of long-term federal funding; (3) making funding available on a cost effective basis; (4) emphasizing research to improve plant design and operation; (5) expanding existing training programs; (6) eliminating federal and state duplication in the area of grant applications; (7) delegating more responsibility to the states; (8) defining secondary treatment in more flexible terms; (9) allowing flexibility with respect to section 204b(1) requirements; (10) deleting the industrial cost requirement; (11)extending the 1977 deadline where necessary; (12) building a data basis for assessing nonpoint pollution sources. Another proposal was doing away with the zero discharge requirement, and allowing more flexibility in effluent guidelines by giving consideration to such variables as raw water quality and differences in geologic functions of source streams. The continuation of ocean disposal in the U. S. was also urged. (Petruff-Florida)

NPDES PERMITS AND WATER ANALYSES.
QLM Labs., Inc., Nyack, N. Y.
R. B. Pojasek.
Environmental Science and Technology, Vol 9, No 4, p 320-24 (April 1975). 1 photo, 1 tab.

Descriptors: *Monitoring, *Measurement, *Regulation, *Water analysis, Permits, Control, Data collections, Legal aspects, Administrative agencies, Water pollution control, Water pollution sources, Federal Water Pollution Control Act, Testing procedures, Methodology, Chemical analysis, Sampling, Laboratory tests, Pollutants.
Identifiers: *National Pollutant Discharge Elimination Permits, Variance.

A substantial monitoring program may be necessary to provide required information to be included in mandatory Federal Water Pollution Control Act (FWPCA) permits for individuals discharging pollutants into a waterway from a point source. One of the most important considerations in the permit-granting process is the analytical methodology employed by the permit applicant. Guidelines which establish test procedures for the analysis of pollutants must be compiled with unless a variance is granted. Confusion exists regarding interpretation of these guidelines. It is unclear whether the standard methods must always be used or whether alternative methods are acceptable. The actual selection of a test procedure varies with the application, the precision and accuracy necessary, and an evaluation of cost and available manpower. Good chemical judgment should always be the primary consideration. The only way for the competent environmental chemist to select a method not included on the guideline list, is by following an established procedure, which is described in detail. The author suggests that the Environmental Protection Agency consider revising the variance procedures. (Rieck-Florida)

Identifiers: *Effluent limitations, *National Pollution Discharge Elimination System, Federal Water Pollution Control Act Amendments of 1972, Point sources(Pollution), Effluent guidelines.

Under the National Pollutant Discharge Elimination System (NPDES), industrial, municipal and other point source discharges must obtain permits setting forth specific limitations on the discharge of pollutants into the navigable waters of the United States. The Federal Water Pollution Control Act (FWPCA) Amendments delegated the task of publishing regulations providing 'guidelines' for uniform effluent limitations from point sources to the Environmental Protection Agency (EPA) Administrator. The regulations give meaning to the terms 'best practicable' and 'best available' when applied to various categories of industries. The guidelines also establish 'effluent limitations' to be imposed on classes and categories of dischargers. Finally, these regulations identify control measures and practices to eliminate discharge of pollutants. The self-monitoring requirements contained in the permit are developed on an individual basis, with consideration given to the type of treatment, the impact of the proposed treatment facilities on the receiving waters, and the parameters to be measured. In the case of a noncomplying discharge, the permittee must take reasonable steps to minimize adverse impact on navigable waters, while increasing monitoring if necessary. (Rieck-Florida)

Identifiers: *Federal Water Pollution Control Act Amendments of 1972, *Point sources(Pollution), *National Pollutant Discharge Elimination System, National Environmental Policy Act, Effluent limitations, Refuse Act of 1899, Congressional hearings, Administrative regulations.

In 1971 Congress surveyed the continuing environmental and economic damage caused by water pollution in the United States, and concluded that the national effort to abate and control water pollution water ineffective. To rectify the situation two major changes were made in the existing law. First, the primary control mechanism was changed from water quality standards to effluent limitations on each point source. Secondly, a national permit system was established to control the discharge of pollutants by each point source. The changes were incorporated in the Federal Water Pollution Control Act Amendments of 1972 (FWPCA). Ambiguities in the language of the FWPCA have diminished its effectiveness. For example, in setting effluent limitations Congress required the 'best practicable control technology currently available'. What factors should determine what is the best practicable control technology. Should there be a single industry standard or should each point source be evaluated separately. Congress conferred the authority to regulate the permit system on the states, or in lieu of state action, upon the Environmental Protection Agency (EPA). However, failure to specify whether states must adopt federal regulations as state law has resulted in lack of uniformity in state administration and enforcement of the FWPCA. (Moorhouse-Florida)

INTERNATIONAL LAW AND RADIOACTIVE POLLUTION BY OCEAN DUMPING: 'WITH ALL THEIR GENIUS AND WITH ALL THEIR SKILL...'
J. W. Hodges.
San Diego Law Review, Vol 11, No 3, p 757-774 (May 1974).

Descriptors: *Radioactive wastes, *International law, *Pollution abatement, *Radioactive waste disposal, Nuclear wastes, Law of the sea, Wastes, Water pollution sources, Waste treatment, Legal aspects, International waters, Water pollution, Disposal, Oceans, Pollutants.
Identifiers: *1972 Ocean Dumping Convention, Radioactive pollution.

The 1972 Ocean Dumping Convention regulates the dumping of all radioactive wastes and materials belonging to ratifying nations. However, nonsignatory nations are not affected by the convention's restrictions. Although the Dumping Convention is a major step toward controlling such pollution, the international law of marine pollution is still a major method of protection. There are four basis for the legal prevention of nuclear pollution of the oceans resulting from the disposal of radioactive waste products. These four principles appear to be exceptionally well suited to nuclear pollution problems. The Freedoms of the Seas principle may reasonably provided a foundation for international law restricting radioactive marine pollution. The right of self protection and the right of self defense may also prove to be viable tools to prevent nuclear dumping. A third concept in international law which lends inself to control of nuclear pollution is the 'Effect Principle' set forth in the Second Restatement of the Foreign Relations Law of the United States. The final, and perhaps most challenging principle may be the protection of certain general interests, or, 'offenses against the Law of Nations'. (Rieck-Florida)

A CONSULTANT'S VIEW OF PL 92-500.
Water and Sewage Works, Vol 122, No 3, p 68-71 (March 1975).

Descriptors: *Engineering, Personnel, *Environmental engineering, *Water pollution control, *Social aspects, *Environmental effects, Financial feasibility, Administration, Administrative decisions, Planning, Decision making, Governments, Project planning, Legislation, Industrial wastes, Water quality, Waste water treatment, Municipal wastes, Treatment facilities, State governments, State jurisdiction, Regions, Regional development, Discharge coefficient, Federal Water Pollution Control Act.
Identifiers: PL 92-500, Federal Water Pollution Control Act Amendments of 1972.

The article presents the view of one consulting engineer of PL 92-500, and of the role of a consultant in the pollution battle. The engineer interviewed, Paul Haney of Block and Veatch, felt that the basic philosophy behind PL 92-500 is good, although the act itself is not. He believed that the act undermined states' rights, and failed to meet public expectations in the clean water cause. He felt the funding must be more stable while the burden of bureaucratic red tape be reduced. The consultant favored deletion of the industrial cost recovery requirement since it actually discourages the formation of regional systems to combine the treatment of industrial and municipal wastes. In his opinion other flaws in the Act are the unrealistic time tables for obtaining permits, the overemphasis on planning, and the impossible goal of zero discharge. The role of the engineering consultant is expanding to encompass environmental, financial, and social aspects of water pollution control. The new regulations' emphasis on cost effectiveness encourages the consultants to be innovative in designing treatment plants. (Rieck-Florida)

PL 92-500: A DOSE OF CHAOS,
Water Pollution Control Federation, Washington, D. C.
J. D. Parkhurst.
Water and Sewage Works, Vol 121, No 9, p cover, 4 (September 1974). 1 photo.

Descriptors: *Pollution abatement, *Water Pollution Control Federation, *Federal Water Pollution Control Act, *Water quality standards, Legislation, Legal aspects, Water pollution, Water quality, Administration, Regulation, Administrative decisions, Water pollution control, Economics, Economic feasibility, Federal government, Costs, Cost sharing.
Identifiers: Environmental policy, Administrative regulations.

The Water Pollution Control Federation workshop comments that the Federal Water Pollution Control Act (FWPCA) is inflexible and cumbersome primarily because it fails to consider local circumstances and constraints. The consensus of member associations criticized the Act's lack of adequate federal funding, unrealistic deadlines and goals, administrative confusion caused by changing guidelines and regulations, the lack of technically competent high-level administrators, and the proliferation of paperwork and red tape. The Water Pollution Control Federation is currently preparing recommendations for proposed amendments to provide for flexibility for the exercise of professional judgment, integrity and fiscal sanity in the FWPCA and its administration. It is imperative that red tape and excessive costs be eliminated if orderly progress is to be achieved toward preservation and enhancement of water quality. (Rieck-Florida)

WHEN YOU THINK ABOUT POLLUTED WATERS, THINK ABOUT YOUR STREAMS AND RIVERS.
The Florida Naturalist, Vol 48, No 4, p 6-11 (1975). 6 photo.

Descriptors: *Federal Water Pollution Control Act, *Pollution abatement, *Water pollution control, *Industrial wastes, *Municipal wastes, Agricultural runoff, Clearcutting, Strip mining, Legal aspects, Regulation, Administrative agencies, Governments, Forest management, Agricultural chemicals, Urban runoff, Pollutants, Streams, Rivers, Abatement, Control.
Identifiers: *Federal Pollution Control Act Amendments of 1972, *Point sources(Poltlution), Non-point sources(Pollution).

Outlined here are steps that concerned citizens can take to insure that the 1972 Amendment to the Water Pollution Control Act work to clean the nation's polluted watercourses. Goals and definitions are provided to aid in understanding the pollution process. Available controls for pollution from industrial and municipal point sources are listed. Remedies for pollution from nonpoint sources such as agriculture, construction sites, logging, mining and urban areas are also discussed. In addition, the steps for water pollution control strategy in Section 208 of the 1972 Water Act are explained. Citizens are urged to pressure local, state and federal water pollution control agencies to carry out federal water quality law. Various routes of citizen action are suggested in demanding that the law be rigorously developed and enforced to clean the nations's rivers and streams. (Rieck-Florida)

BISCAYNE BAY SYMPOSIUM II,
Miami Univ., Fla. Sea Grant Institutional Program.
C. E. B. McKenry.
Sea Grant Special Report No. 6, April 1976. 23 p.

Descriptors: *Bays, *Water utilization, *Water quality, *Preservation, Water management(Applied), Regulation, Legislation, Water policy, Population, Water sports, Economic impact, Permits, Construction, Fishing, Biota, Water pollution, Waste disposal, Marinas, Boating regulations, *Florida.
Identifiers: *Biscayne Bay(Fla), Symposium, Aquatic preserve area.

Legislative concern about the deterioration of Biscayne Bay culminated in a 1974 law designating the Bay as an aquatic preserve. Before any further action can be taken, the public consensus must be assessed. The first Symposium on Biscayne Bay raised several technical issues which Symposium II addressed. The analysis and discussion of the Bay was divided into three major areas: (1) Environmental quality; (2) Utilization; and (3) Bay management. In considering the Environmental quality aspect, it was noted that water quality is the key to the restoration and preservation of a healthy bay. Specific recommendations include: (1) regulation and control of boat discharges into the Bay; (2) encouragement of the county for rules which are more restrictive than State or Federal rules; (3) strict enforcement of regulations on runoff of fertilizers and pesticides; (4) greater care and maintenance of the Bay to be used for both sports and commercial fishing activities. Several recommendations were made on induced mangrove growth in the area. Recommendations made in the Bay utilization area include: (1) regulation for safety and use designation when activities increase in the future; (2) additional public access to the Bay; (3) maintenance and enforcement of appropriate zoning standards. In regard to Bay management, the report urged the creation of a unified Biscayne Bay Authority to coordinate research, create a master plan, control pollution and disseminate information. SAY GOODBYE TO OCEAN DUMPING,
P. S. Ward.
Journal Water Pollution Control Federation, Vol 48, No 3, p 426-28 (March 1976).

Descriptors: *Alternative costs, *Oceans, *Water quality, *Water pollution control, Disposal, Waste disposal, Municipal wastes, Alternative planning, Incineration, Landfills, Land reclamation, Drying, Soil contamination.
Identifiers: Cropland application, Recalcination, Compost, Metals extraction.

A recent Environmental Protection Agency (EPA) decision involving the disposal of sludge makes the disposal, or use, of sludge a significant issue. The theoretical alternatives include incineration, landfilling, cropland application, land reclamation, recalcination of lime-based sludges, drying and marketing, composting, metals extraction, and the synthesis of useful projects. However, practical limitations eliminate many of these possibilities at the outset. An individual analysis of each possibility included such problems as air pollution, sanitation, lack of access to large tracts of land, pretreatment requirements, water contamination from runoff, and immense capital costs. The abandonment of ocean dumping as a sluge disposal alternative involves real economic sacrifice. Cost data on various disposal alternatives generally reveal that ocean disposal is the cheapest alternative available. This is demonstrated by the table provided, which offers a cost comparison of seven sludge disposal options. The conclusion of rather extensive analysis was that all forms of sea disposal are appreciably more economical than any form of land disposal studied. (Rieck-Florida)

EPA PROPOSES UNTIMELY AMENDMENTS,
A. S. Heid.
Journal Water Pollution Control Federation, Vol 48, No 3, p 424-26 (March 1976).

Descriptors: *Treatment facilities, *Water quality standards, *Economics, *Federal budget, Legislation, Construction, Cities, Facilities, Budgeting, Economic justification, Construction costs, Water pollution, Water quality, Economic feasibility, Grants, Financing, Government finance.

As a result of pressure from the Office of Management and Budget, in an effort to bring spending within budget capacities, Russell Train, head of the Environmental Protection Agency (EPA), has proposed several amendments to the Federal Water Pollution Control Act (FWPCA) Amendments of 1972. These amendments concern the construction grants program for municipal facilities. The first amendment would provide that the federal share of construction grants for certain categories of treatment works could be reduced to less than 75 percent for projects authorized after fiscal year 1976. The next proposed amendment provides limitations on the amount of reserve capacity for treatment plants that is eligible for federal assistance. The third amendment proposes that federal funding would be provided only up to levels necessary to bring projects into compliance with federal effluent limitations based on secondary treatment or best practicable waste treatment technology. The last amendment would amend Section 301 of the FWPCA, and proposes that the current deadline be extended on a case-by-case basis up to Jly 1, 1983, so that publicly owned treatment works would comply with secondary treatment and water quality requirements. RECENT DEVELOPMENT, ENVIRONMENTAL LAW--WATER POLLUTION.
Indiana Law Review, Vol 9, No 3, p 702-10 (1976).

Descriptors: *Illinois, *Indiana, *Interstate rivers, *Interstate, Federal government, State governments, Political aspects, Legal aspects, Water policy, Bodies of water, Lakes, Great Lakes, Lake Michigan, Great Lakes Region, Industrial wastes, Effluents, Industrial water, Social aspects, Water pollution, Water pollution control.
Identifiers: *Inland Steel Company, *Federal Water Pollution Control Act, Nuisance(Legal aspects).

The defendant, Inland Steel Company, was found guilty of interstate water pollution and fined $1,905,000 by a Cook County (Illinois) Circuit Court. Inland Steel is a Chicago-based company operating in Indiana. A short time prior to the filing of the suit, the federal Environmental Protection Agency (EPA) has approved Inland's current and proposed pollution control programs. Additionally, the discharge operations were in conformity with Indiana water quality standards. Defendant objected to the Illinois court's election to apply the Illinois water quality standard rather than either the Indiana statute or the Federal Water Pollution Control Act (FWPCA). The Illinois court rejected the Inland Steel plea, and ruled that a corporation operating outside the forum state is liable to the state in which the trial court sits under the forum state's standards for the pollution of interstate waters. The court reasoned that the Federal Government had not preempted the field of water pollution control, and states could therefore apply their own standards. Additionally, no state was at the mercy of a neighbor state whose water quality standards were less stringent. Hence, although Inland Steel may have been in conformity with both Federal and Indiana law, they were liable under the more stringent Illinois statute. (Moorhouse-Florida)

WETLANDS PROTECTION UNDER THE CORPS OF ENGINEER'S NEW DREDGE AND FILL JURISDICTION,
D. Ratliff.
Hastings Lw Journal, Vol 28, No 1, p 223-45, September, 1976.

Descriptors: *Dredging, *Tidal marshes, *Wetlands, *Protection, Headwaters, Rivers, Streams, Coasts, Navigable waters, Marshes, Bodies of water, Jurisdiction, Legislation, State jurisdiction, Federal jurisdiction, Administrative agencies, Regulations, Legal aspects, Water policy, Permits, Inland waterways, Governmental interrelations.
Identifiers: *Federal Water Pollution Control Act Amendments of 1972, *Coastal wetlands, Fill permits, Administrative regulations.

The delicately balanced marsh ecosystem of the tidal wetlands is extremely vulnerable to the enterprises of modern man. Dredge and fill activities have done disastrous and irrevocable damage to the tidal marsh resource. New Army Corps of Engineers regulations recognize the ecological importance of wetlands. They expand the Corp's jurisdiction under section 404 of the Federal Water Pollution Control Act (FWPCA) of 1972. This broader jurisdiction which includes coastal wetlands contiguous or adjacent to navigable waters, should enable the Corps to defend tidal marshes more effectively. Inland jurisdiction is enlarged to extend in all cases to the 'headwaters' of the river, lake or stream. The move toward joint permit processing with responsible state agencies is an attempt to end bureaucratic delay. The new regulations are, however, replete with vague terms, leaving the precise contours of the new jurisdiction to be decided by future conflict. The overly narrow definition of 'coastal wetlands' and an overly broad disclaimer clause are a few of the major problems with the regulations. These objections aside, the interim final regulations are an encouraging advance for wetlands protection. (Rieck-Florida)

UNITED STATES V. GAF CORPORATION: A LEAK IN THE FWPCA,
N. Tauman.
Environment Law, Vol 6, No 2, p 561-81 (1975).

Descriptors: *Groundwater, *Water quality control, *Water quality standards, *Water pollution control, *Water permits, Water pollution, Water pollution sources, Water quality, Water resources, Water law, Waste disposal, Waste disposal wells, Waste dumps, Underground streams, Soil water, Chemical wastes, Judicial decisions, Effluents.
Identifiers: *Federal Water Pollution Control Act Amendments of 1972, *Effluent limitations.

The operation of the Federal Water Pollution Control Act (FWPCA) Amendments of 1972 was at issue in United States v. GAF Corporation. The federal government sought to enjoin the drilling of two deep wells for the disposal of organic chemical wastes without prior approval of the Environmental Protection Agency (EPA). The court held that disposal of chemical wastes into underground waters was not covered by the Act, and alternatively, that EPA's failures to promulgate effluent limitation standards prevented the government's prosecution. While groundwater was specifically excluded from the Act's definition of navigable water, the Act provides that the states have authority to regulate well discharges. The court further interpreted the Act to mean that until effluent limitations standards are set by EPA, pollution discharges cannot be limited; disregarding the interpretation by EPA that the failure to set effluent limitations would preclude the discharging of any wastes at all. The Act itself and legislative history clearly show that a permit is mandatory when effluent limitations have been set. Further, the author states that the court erred in asserting that there was no provision in the Act for interim permits. The Act gives the EPA Administrator power to issue permits and set conditions as he sees fit in order to carry out the provision of the Act in the absence of the necessary standards. The decision of this court gives impetus to industry for the delay in setting effluent limitations, and could

TOXIC POLLUTANT EFFLUENT STANDARDS FOR ALDRIN/DIELDRIN, DDT, ENDRIN, AND TOXAPHENE,
Environmental Protection Agency, Washington, D. C.
Federal Register, Vol 42, No 8, p 2588-2617, January 12, 1977.

Descriptors: *Federal Water Pollution Control Act, *Water quality standards, *Regulation, *Toxins, *Chemicals, Chemical industry, Pollution, Standards, Administrative agencies, Aquatic life, Toxicity, Effluents, Water quality control, Public health, Environmental effects, Water pollution control.
Identifiers: Administrative regulations, Aldrin/Dieldrin, DDT(DDD DDE), Endrin, Toxaphene, Ambient water criterion, Effluent limitations.

Pursuant to $307(a) of the Federal Water Pollution Control Act (FWPCA) as amended, the Environmental Protection Agency (EPA) proposed general regulatory provisions and toxic pollutant effluent standards for four toxic substances: aldrin/dieldrin, DDT (DDD, DDE), endrin and toxaphene. Each of the proposed standards provides for maximum average daily and monthly effluent standards (or prohibitions). The standards for endrin and toxaphene also include a monthly average emission limit. In addition, each standard provides an ambient water criterion. If the effluent standards are not sufficient to achieve the ambient water criterion because of local receiving water conditions, the cognizant regulating authority may impose more stringent effluent limitations in order to achieve the required criterion. In developing the standards the EPA considered the effect of the pollutant on organisms in the waters and the effects on human health. All other federal agency comments were reviewed and considered by the EPA. It also summarized comments to the proposed regulations from other interested parties and made necessary changes in the regulations in response to those comments. (Rieck-Florida)
W77-08983

EFFLUENT GUIDELINES AND STANDARDS FOR FERTILIZER MANUFACTURING POINT SOURCE CATEGORY, UREA AND AMMONIUM NITRATE SUBCATEGORY.
Environmental Protection Agency, Washington, D. C.
Federal Register, Vol 41, No 138, p 29429-32, July 16, 1976.

Descriptors: *Ureas, *Fertilizers, *Ammonium compounds, *Nitrogen compounds, Ammonia, Nitrogen, Regulation, Water pollution sources, Wastes, Water quality, Water law, Water pollution, Legal aspects, Agricultural chemicals, Pollution abatement, Water quality standards, Federal government, Industrial wastes, Water pollution control.
Identifiers: *Effluent limitations, *Administrative regulations, Point source pollution control.

The Environmental Protection Agency (EPA) has proposed to amend the effluent guidelines for urea and ammonium nitrate manufacture in the face of industry charges that inadequate data bases were used in prior determinations. The EPA received data from over 70% of all such manufacturers in response to its latest request. The urea subcategory was divided into plants making solutions only and those producing prilled or granulated urea. The underlying assumption that the additional process of prilling would increase discharges slightly was supported by data from urea manufacturers. However, plants producing prilled ammonium nitrate had equal and even lower discharges than those producing ammonium nitrate solutions. Therefore all forms of ammonium nitrate were combined in establishing the new regulations. Standards based on application of the best practicable control technology currently available and the best available technology economically achievable are presented for both the urea and ammonium nitrate subcategories. Numerous tables are included to illustrate the data used and the new standards. (Moorhouse-Florida)
W77-08984

INTERIM PRIMARY DRINKING WATER REGULATIONS: PROMULGATION OF REGULATIONS ON RADIONUCLIDES.
Environmental Protection Agency, Washington, D.C.
Federal Register, Vol 41, No 133, p 28402-409, July 9, 1976.

Descriptors: *Potable water, *Public health, *Radioisotopes, *Radium radioisotopes, Radioactivity effects, Radiation, Uranium radioisotopes, Water quality, Domestic water, Water pollution sources, Legal aspects, Water law, Water properties, Water pollution, Social aspects, Safety, Regulation.
Identifiers: *Administrative regulations, Radionuclide, Public Health Service Act, Public health service, Health hazards.

The regulations for radioactivity in drinking water promulgated pursuant to the Public Health Service Act are presented by the Environmental Protection Agency (EPA) herein in final form. Estimates reveal that approximately 500 community water systems would exceed the maximum contaminant level for radium of 5 pCi. Furthmore, screening measurements of gross alpha particle activity are permitted for all public water systems that exceed 2 pCi per liter in lieu of radium analysis. 5 pCi/liter was retained as the maximum contaminant level for radium despite requests for a higher limit for small public water systems. Evidence provided by the U.S. Public Health Service indicated that any higher level of contamination presented serious health hazards. In addition, numerous technical changes were made in the proposed regulations to add clarity and delete obsolete methods. For example, a new detection limit of 4 pCi/liter has been established for gross beta particle activity so that gross beta analysis may serve as a substitute radiation measure in some cases. The regulations will become effective in their entirety June 24, 1977. Several tables are used to illustrate the parameters established, substantive technical data is incorporated in the document, and appendices consisting of comments and suggestion received by the EPA in the course of this study are included. (Moorhouse-Florida)
W77-08985

EFFLUENT GUIDELINES AND STANDARDS FOR IRON AND STEEL MANUFACTURING POINT SOURCE CATEGORY.
Environmental Protection Agency, Washington, D.C.
Federal Register, Vol 41, No 61, p 12990-13004 March 29, 1976.

Descriptors: *Effluents, *Iron, *Steel, *Regulation, *Administrative agencies, Iron compounds, Federal government, Water pollution, Water pollution sources, Industrial wastes, Liquid wastes, Discharge(Water), Technology, Industrial plants, Industrial production, Industrial water, Economic impact, Industries, Operations, Regional economics.
Identifiers: *Effluent limitations, *Iron and Steel Manufacturing Point Source Category, Subcategories, Effluent guidelines and standards, Administrative regulations.

The Environmental Protection Agency (EPA) promulgated effluent limitations and guidelines for the steel and iron manufacturing industries in 1974. 1976 amendments to the regulations set new limits for various subcategories of the iron and steel manufacturing process. Standards for new sources are also included in these regulations. The principal basis for defining subcategories to which the effluent limitations apply are the inherent manufacturing or production processes associated with several steel products. Plant size and age are not viable factors for subcategorization as previous studies have shown no discernible relationship between these factors and raw waste loads, effluent quality or effluent treatability. Examination of the raw waste characteristics, process water application rates, discharge rates and effluent quality has made land location a non-viable characteristics for subcategorization. The EPA recognizes that the economic impact of the point source regulations would be detrimental to communities mainly of iron and steel works. Some latitude has therefore been granted in the issuance of permits, but such iron and steel works are expected to install new technology at an economically feasible pace. (Moorhouse-Florida)
W77-08986

CONTROL OF POLLUTION BY OIL AND HAZARDOUS SUBSTANCES, DISCHARGE REMOVAL.
Coast Guard, Washington, D.C.
Federal Register, Vol 41, No 59, p 12628-34, March 25, 1976.

Descriptors: *Coast Guard regulations, *Oil spills, *Penalties(Legal), *Administrative agencies, Federal government, Regulation, Legal aspects, Oil industry, Administrative decisions, Decision making, Water pollution sources, Disasters, Oil wastes, Chemical wastes, Oil pollution, Offshore platforms, Coastal structures, Law enforcement, Legal review, Judicial decisions, Costs.
Identifiers: *Administrative regulations, Hazardous substances.

The Department of Transportation has promulgated rules concerning notification to the Coast Guard of the discharge of oil or hazardous substances, the removal of a discharge of oil, and the costs or reimbursements that may be imposed or recovered for the removal of a discharge of oil or hazardous substances. Each district commander of the Coast Guard is delegated authority to assess a fine against a vessel or an onshore or off-shore facility owner who illegally discharges proscribed substances. In the event of a discharge, notification must be made to the Coast Guard National Response Center, or to the Cammander of the Coast Guard District in which the discharge occurs. Any person failing to make proper notification is subject to a fine and imprisonment. The removal of discharged oil must be made with mechanical methods and sorbents that most effectively expedite removal and minimize secondary pollution from removal operations. Chemical agents utilized for removal must be in accordance with the National Contingency Plan. Payments to the pollution fund will be required for the use of personnel and equipment necessary to remedy an oil discharge. (Moorhouse-Florida)
W77-08987

PERMIT PROGRAM REGULATIONS FOR CONCENTRATED ANIMAL FEEDING OPERATIONS.
Environmental Protection Agency, Washington, D. C.
Federal Register Vol 41, No 54 p 11458-61, March 18, 1976.

Descriptors: *Permits, *Feed lots, *Farm wastes, *Regulation, Federal Water Pollution Control Act, Cattle, Confinement pens, Feeds, Livestock, Federal government, Administrative agencies, Legal aspects, Water pollution, Control, Water pollution sources, Water pollution control, Legislation, Wastes, Inspection, Poultry.
Identifiers: *Administrative regulations, *National Pollutant Discharge Elimination System(NPDES), Certification.

The Environmental Protection Agency (EPA) has promulgated regulations for applying the National Pollutant Discharge Elimination System (NPDES) permit program to concentrated animal feeding operations. Under the program permits are required for feeding operations with 1,000 or more animals for all feedlots with discharges of pollutants. For those feedlots with less than 1,000 but more than 300, permits will be required only for those operations which discharge pollutants through a man-made conveyance or directly into navigable waters which pass through the confined area. For feedlots with less than 300 animals, the general rule is to require no permit, but one may be required on a case by case basis. The EPA has summarized the comments made by members of the feeding operations industry and has responded thereto. The EPA has emphasized that the feedlot regulations were issued in response to a court order in Natural Resources Defense Council v. Train. The EPA has taken an appeal of this case, and therefore the final status of the promulgated regulations is as yet unknown. (Moorhouse-Florida)

HYPEROXYGEN CONCENTRATIONS IN THE HYPOLIMNION PRODUCED BY INJECTION OF LIQUID OXYGEN,
Limnological Associates, Ojai, Calif.
A. W. Fast, W. J. Overholtz, and R. A. Tubb.
Water Resources Research, Vol 13, No 2, p 474-476, April 1977. 3 fig, 13 ref.

Descriptors: *Dissolved oxygen, *Oxygenation, *Ponds, *Supersaturation, On-site investigations, Hypolimnion, Oxygen demand, Temperature, Pressure, Lakes, Limnology, *Ohio.
Identifiers: *Liquid oxygen, Liquid-oxygen injection, Oxygen concentrations.

The hypolimnion of a quarry pond at Ottoville, Ohio, was oxygenated during the summers of 1973 and 1974. The highest hypolimnetic oxygen concentrations attained were 8.0 mg/l in 1973 and 21.5 mg/l in 1974; thermal stratification was maintained both years. The 21.5 mg/l oxygen concentration is the highest value yet reported for a hypolimnion and constitutes an upper limit controlled by pressure, temperature, and oxygen demand. Degassing was observed as the high value was reached. Hypolimnion concentrations (of N2) were calculated for different injected mixtures of O2 and N2 gases. (Sims-ISWS)

WETTABILITY OF COAL-MINE SPOILS IN NORTHWESTERN NEW MEXICO,
New Mexico State Univ., University Park. Dept. of Agronomy.
S. Miyamoto, A. Bristol, and W. L. Gould.
Soil Science, Vol 123, No 4, p 258-263, 1977. 1 fig, 5 tab, 8 ref.

Descriptors: *Wettability, *Spoil banks, *Mine wastes, *Land reclamation, *Strip mine wastes, *New Mexico, Analytical techniques, Wetting, Strip mines, Vegetation establishment, Coal mines, Waste dumps, Reclamation, Infiltration, Mining, Physical properties.
Identifiers: *Water infiltration rates, *Infiltration tests, Fruitland formation, Water drop penetration, Capillary rise, Sodicity.

The wettability of coal mine spoils in the Fruitland formation of north-western New Mexico was studied for its effect on water infiltration. Water drop penetration and capillary rise tests were used to evaluate wettability of graded spoils, crushed overburden, and coal samples. Laboratory infiltration tests were used for verification. Results indicate: (1) spoils composed of coal fragments are poorly wettable or water-repellent; (2) organic matter in coal, especially in shiny high-grade coal, is a probable source of poor wettability; and (3) poor wettability reduces water infiltration into coaly spoils. Sodicity and spoil textures also play significant roles governing infiltration into spoils of this formation. (Henley-ISWS)

Descriptors: Water resources development, *Maryland, Costs, *Chesapeake Bay, *Economics, Water pollution sources, Industrial wastes, River basins, Waste water treatment, Cost analysis, Environment, Input-output analysis, Water quality control.

An essential first step in evaluating pollution costs and environmental quality is to derive the relationships between the types and levels of economic activity as they effect the generation of residuals. Methods were developed of extending traditional input-output models to account for the generation of residuals, and to trace the flows through treatment processes and environmental media. Specific technical gross residual coefficients were derived for the output of emissions from 92 types of economic activity into the Chesapeake Bay by 15 major river basins.

Identifiers: *Lake Carlton(Fla), *Orange and Lake Counties(Fla).

Lake Carlton straddles the line between Lake and Orange Counties in central Florida. The 382-acre lake is highly eutrophic and subject to virtually perpetual algal blooms. The Florida Game and Fresh Water Fish Commission has proposed to restore the lake to a less eutrophic state by dewatering the lake long enough to allow the muck on its bottom to dry and compact. Lake Carlton would be permanently sealed off from Lake Carlton. On the assumption that the seasonal rainfall would be normal, and that the dewatering phase would begin on March 1, the predicted time required to dewater the lake at a pumping rate of 50,000 gpm (gallons per minute) is 21 days. The average rate of pumping required to maintain the lake in a dewatered condition is computed to be 2,400 gpm. If pumping is ended May 31, the predicted altitude to which the lake would recover by October 31 as a result of net natural input is 56.2 feet above sea level. Raising the lake level to 63 feet above sea level by October 31 would require that the net natural input be supplemented at an average rate of about 4,860 gpm between May 31 and October 31. CITIZEN PARTICIPATION IN WATER POLICY FORMATION,
Washington State Water Research Center, Pullman.
J. C. Pierce, and H. R. Doerksen.
Available from the National Technical Information Service, Springfield, VA as PB-268 800, Price codes: A04 in paper copy, A01 in microfiche. 1975, 41 p, Paper presented at annual meeting of Western Political Science Association, March 20-21, 1975, in Seattle, Washington. OWRT A-069-WASH(1).

Descriptors: *Social participation, Political aspects, Social value, *Washington, *Attitudes, *Water policy, Surveys.
Identifiers: *Public participation, Citizen participation.

Based on a survey of 1300 households in the state of Washington, of which more than 60 percent responded, this paper views one portion of the public-to-policy theme by examining the level of public participation among the public and the level of public support in the water resource policy area. Because many are concerned with making government more responsive through public involvement, the actual levels of involvement and the extent to which the public supports that involvement should be among the first issues confronted. The three decision-making locations preferred by the public were experts, groups of citizens advising, and administrators with expert advice. Least preferred were the more 'political' locations--state legislature, interest groups of decision-making locations. The most preferred ways by which the public might influence policy were citizen advisory committees, public hearings, initiative and petitions, and elections. The least preferred processes were contacting state legislators, contacting agency people contacting interest groups and politial parties. The order of priorties ranged from those in which the public has more direct formal control, to those in which the publics influence is more indirect and informal.

RECREATIONAL WATER RESOURCES PROBLEMS.
Bureau of Outdoor Recreation, Washington, D.C.
April 9, 1975. 4 p.

Descriptors: *Recreation, *Environmental effects, *Cost-benefit analysis, *Access routes, Transportation, Economics, Water sports, Aesthetics, Beaches, Camp sites, Fishing, Boating, Natural resources, Water pollution, Recreation demand, Recreation wastes, Recreation facilities, Social aspects, Use rates, Water quality control, Federal government, State governments, Legal aspects, Biology, Institutional constraints.
Identifiers: Recreational water resources problems, Water Resources Research Conference.

The recreational use of water resources and the current lack of available information concerning this topic are discussed. Extensive research is recommended in the following areas of recreational water resources: (1) the relationship between the available supply of outdoor recreation areas and the rate of outdoor recreation participation; (2) conflicts between recreational and non-recreational use of water resources; (3) the distinction patterns of recreationists in order to properly assess recreation potentials of a given study area; (4) the legal, institutional and economic restraints that prevent the private sector from further providing recreational opportunities; (5) the optional biological, physical, and sociological capacity of recreation resources; (6) the environmental impacts of recreational use of water resources, and (7) legal and physical problems which prevent access to existing water areas. Generally, the availability of outdoor recreations areas, facilities and programs is a significant influence upon the extent of outdoor recreation participation. More adequate knowledge about this relationship would greatly assist in planning project areas for public use. (Nursey-Florida)

UTILITY ANALYSIS FOR THE URBAN GROWTH INSIDE THE RECHARGE ZONES OF THE GROUNDWATER RESOURCES OF SAN ANTONIO, TEXAS,
Texas Univ. at San Antonio. Dept. of Environmental Studies.
C. S. Shih, and James W. Ingram.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-268 788, Price codes: A07 in paper copy, A01 in microfiche. Completion Report, April 1977. 121 p, 6 tab, 60 ref, 2 append. OWRT B-192-TEX(1). 14-31-0001-5117.

Descriptors: *Groundwater resources, Management, Groundwater recharge, *Texas, *Water pollution, *Utilities, Cities, *City planning, *Urbanization, Model studies, Decision making, Social impact.
Identifiers: *San Antonio(Tex), *Edwards aquifer, Recharge zone, *Decision utility theory, *Multiattribute utility function.

With the recent advent of multiattribute utility function development, the decision analysis imbedded with the multiattribute utility measurement has become a powerful tool for analyzing the complex problems normally faced by the water resources planners and managers. The City of San Antonio, Texas, is faced with an agonizing decision of how to protect its sole water source, the Edwards Aquifer, from the threat of pollution resulting from urban sprawl over the recharge zone of the aquifer. Recent urban growth to the north and northwest of San Antonio has intensified the concern for the protection of this pristine, high quality water resource. A decision analysis model has been structured in an effort to facilitate an objective analysis and to coordinate the judgements regarding a degree of satisfaction associated with each alternative available for the protection of San Antonio's groundwater. Multiattribute utility function was used as an integrated measure of the effectiveness for various feasible alternatives. The necessary information was polled from the local water resources decision-makers through a series of cyclic opinions surveys based on the Delphi technique. Sensitivity analysis with varying assumptions was performed on the joint probability that groundwater resources will be polluted due to potential surface developments.

THE STRUCTURAL ANALYSIS OF ENVIRONMENTAL PERCEPTION AND COGNITION: A MULTIDIMENSIONAL SCALING APPROACH,
Royal Inst. of Tech., Stockholm (Sweden). Dept. of Architecture.
T. Garling.
Environment and Behavior, Vol. 8, No. 3, p 385-415, September 1976. 4 fig, 16 tab, 43 ref.

Descriptors: *Behavior, *Psychological aspects, Analytical techniques, Model studies, *Attitudes, Motivation, Social aspects, *Social values, Evaluation, Social participation.
Identifiers: *Multidimensional scaling, Semantic differential analysis, Cluster analysis, Factor analysis, Cognitive structure.

Multidimensional scaling is used to test hypotheses about perceptual/cognitive structure, where perceptual/cognitive structure is defined as the classification and coding of the physical environment. Data were also collected by the ordinary semantic differential technique for purposes of comparing methods and results. Since the area of structural analysis is largely unknown, alternative multidimensional scaling models, including the categorical model and the dimensional models, were used for comparison purposes. The factor analysis and the metric multidimensional scaling analysis suggest a close correspondence between results. It is concluded that the different methods reveal the same underlying structure. The similarity of results from the different methods suggests that similar interpretations of the factors are appropriate. These results are compared with the findings of previous studies. The basis for the evaluative assessments measured by the semantic differential technique is revealed by multidimensional scaling and cluster analysis. These analyses reveal a categorization process to which the individual contributes his systematized knowledge about his everyday physical environment. (Nessa-NC)

Wisconsin Univ. Extension, Madison; and Wisconsin Univ., Madison. Inland Lakes Renewal and Management Demonstration Project.
S. M. Born, W. B. Lord, F. Alston, W. Bernhagen, and J. Binando.

Inland Lakes Demonstration Project, Funded by the Upper Great Lakes Regional Commission, June, 1972. 155 p, 12 fig, 12 tab.

Descriptors: *Alternative planning, *Project planning, *Institutions, *Methodology, *Water allocation(Policy), *Wisconsin, Economic efficiency, Social aspects, Administration, Land use, Land management.
Identifiers: *Chippewa River(Wis), *Chippewa flowage(Wis), *Inland Lakes Demonstration Project, Citizen participation, Interest groups.

The report contains the factual data necessary for evaluating the environmental aspects of the Chippewa Flowage project. It also defines the nature of the controversy, develops an array of alternatives, and evaluates the monetary and non-monetary consequences of each alternative. The methodology employed involves: (1) a definition of the objectives of resources management; (2) the development of each alternative. Objectives are specific statements describing the end product of policies and programs. Objectives may be contradictory and controversial, but they should be desirable in the eyes of at least some persons or groups. The definition of objectives was based on existing objectives and uses, an evolution of interest group positions, personal interviews and contacts, and press coverage. Alternatives were evaluated by first identifying pure alternatives that maximized the attainment of a single objective. The implications of pure alternatives were evaluated, which led to the refinement of the objective statements and the development of realistic proposals. The consequences of each alternative were evaluated in the context of three factors, including a release policy for the Chippewa Reservoir, a plan for lands surrounding the Flowage, and an institutional configuration that would be responsible for implementation. CHIPPEWA FLOWAGE INVESTIGATIONS. PART 3A: APPENDIXES.
Wisconsin Univ. Extension, Madison; and Wisconsin Dept. of Natural Resources, Madison.
Inland Lakes Demonstration Project, Funded by Upper Great Lakes Regional Commission, June, 1972.

Descriptors: *Multiple purpose projects, *Investigations, *Basic data collections, *Documentation, *Wisconsin, Permits, Environmental effects, Social aspects, Social impacts, Decision making, Water chemistry, Oxygen demand, Reservoir fisheries, Fish populations, Benthic fauna, Zooplankton, Phytoplankton, Aquatic plants.
Identifiers: *Chippewa River(Wis), *Chippewa flowage(Wis), *Inland Lakes Demonstration Project, Citizen participation, Environmental impact statement.

The appendices contain the data used in the analysis described in Chippewa Flowage Investigations Part 1: Summary Report. Although the data were developed in response to a specific controversy, the results of these studies will stand alone and be useful for resource management purposes regardless of the ultimate resolution of this controversy. This document contains nineteen appendices that cover two types of information. One subset of appendices deals with the administrative, legal, and political context of the controversy. The issues addressed include Federal Power Commission licensing procedures, the project's environmental impact statement, National Environmental Policy Act review procedures, U.S. congressional action affecting the project, a chronology of events affecting an Indian tribe on Flowage lands, and selected position statements of interest groups. A second subset of appendices contains scientific data. They discuss the physicochemical characteristics of the water, oxygen depletion during ice cover, fish populations, fisheries, Benthic invertebrates, phytoplankton, and zooplankton. Twenty-three additional appendices are contained in Chippewa Flowage Investigations--Part 3B: Appendixes. (See W77-08725 and W77-08727) (Nessa-NC)
W77-08726

CHIPPEWA FLOWAGE INVESTIGATIONS. PART 3B: APPENDIXES.
Wisconsin Univ. Extension, Madison; and Wisconsin Dept. of Natural Resources, Madison.
Inland Lakes Demonstration Project, Funded by Upper Great Lakes Regional Commission, June, 1972.

Descriptors: *Multiple purpose projects, *Investigations, *Basic data collections, *Documentation, *Wisconsin, Aquatic plants, Bank erosion, Water pollution effects, Water level fluctuations, Ecosystems, Social aspects, Economic impact, Recreation, Permits, Land management.
Identifiers: *Chippewa River(Wis), *Inland Lakes Demonstration Project, *Chippewa flowage(Wis), *Wilderness preservation, Primitive areas.

The appendices contain the data used in the analysis described in Chippewa Flowage Investigations--Part 1: Summary Report. Although the data were developed in response to a specific controversy, the results of these studies will stand alone and be useful for resource management purposes regardless of the ultimate resolution of this controversy. This document contains twenty-four appendices covering four types of information. One subset of appendices sets forth scientific information on aquatic vegetation, shoreland erosion, downstream water quality considerations, and also includes an annotated bibliography on the effects of water level fluctuations on aquatic ecosystems. A second subset of appendices contain socioeconomic information. A county profile, an Indian tribe profile, and the projected tax impacts of alternatives are included. The third subset of appendices deals with recreation and wilderness preservation issues, including alternatives for preserving and managing national wild land values, primitive area objectives, and the study group's methods and findings. The fourth subset deals with institutional problems such as Federal Power Commission relicensing and alternative land use control mechanisms. (See W77-08725 and W77-08726) (Nessa-NC)
W77-08727

ENVIRONMENTAL PLANNING FOR AN ALASKAN WATER-ORIENTED RECREATION AREA,
Alaska Univ., College. Inst. of Water Resources.
D. W. Smith.
Report No. IWR-64, June 1975. 429 p. OWRT B-026-ALAS(1).

Descriptors: Environmental engineering, *Recreation facilities, *Recreation wastes, *Algae, Nutrients, *Productivity, *Alaska, *Data collections, Lakes, Water pollution effects, Eutrophication.
Identifiers: *Nancy Lake area(Alas), Anchorage(Alas), *Algal production.

This document is a partial completion report and concerns a phase of the project which has been terminated. The principal objective of this study was to detail the procedures, methods, alternatives, and considerations necessary for the development of environmental management programs for Alaska water-oriented recreational areas. Major emphasis was to be placed on the Nancy Lake area near Anchorage. This report is a compilation of the data collected up to September 1, 1974. Contained are: an outline of proposed project reports, a summary of the limnological data collected, a data folder concerning lakes in the study region, a thesis conducted at Nancy Lake, 'Effects of Nutrient Addition on Algal Production and an Evaluation of a Method of Measuring Algal Production,' and a copy of IWR Report No. 63, 'Evaluation of the Trophic Types of Several Alaskan Lakes by Assessment of the Benthic Fauna.'

PROCEEDINGS: THE CONNECTICUT RIVER SYSTEM: A WORKSHOP ON RESEARCH NEEDS AND PRIORITIES.
Massachusetts Univ., Amherst. Inst. for Man and Environment; Massachusetts Univ., Amherst. Water Resources Research Center.
W.R.R.C. Publication No 52, Completion Report FY-75-5, July 1975. 132 p, 4 append. OWRT A-078-MASS(1). 14-31-0001-5021.

Descriptors: *Connecticut River, *Conferences, *Massachusetts, *Research priorities, Regional analysis, Environment, Institutions, Model studies, Water quality, Water supply, Economics, Legal aspects.
Identifiers: *Research needs.

A workshop on research needs and priorities on the Connecticut River system was conducted on April 24-25, 1975 at the University of Massachusetts. The goals were to generate multidisciplinary, inter-institutional interest in a future co-ordinated research program, and define and evaluate the priorities of needed research. The plenary session presentations included: (1) introductory remarks: a research focus on the Connecticut River; (2) future environmental needs and costs; (3) the need to establish research priorities; (4) panel discussion: the need for regional collaboration; (5) an overview of basin research priorities; (6) the Connecticut River system: research and environmental protection priorities; (7) strategies for institutional collaboration; and (8) where do we go from here. Working group activities included: (1) modeling water quality and quantity; (2) floodplain ecosystems; (3) aquatic ecosystems; (4) legal and economic issues; and (5) man/environment relations.

ECONOMIC EVALUATION OF IDAHO'S WATER SUPPLY,
Idaho Univ., Moscow. Dept. of Agricultural Economics.
W. C. Bailey.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-268 811, Price codes: A06 in paper copy, A01 in microfiche. M.S. Thesis, July 1975. 96 p, 19 fig, 5 tab, 31 ref, 3 append. OWRT A-044-IDA(1). 14-31-0001-5012.

Descriptors: *Economic impact, *Water supply, *Economies of scale, *Idaho, *Evaluation, *Costs, Municipal water, Industrial water, Irrigation water, *Regression analysis, Cost analysis.
Identifiers: Snake RIver(Idaho).

This study examined the costs involved in making water available for use in Idaho. The difference between quantity of water and a supply of water was emphasized. To change a quantity of water into a supply of water requires that costs be incurred. In examining the cost for making water available for use in Idaho, the water supply industry was segmented into three categories: municipal, industrial, and irrigation. Primary and secondary sources were used in the collection of data from these three categories. Regression analysis was performed on the data to determine the relationship between total, fixed and variable cost, and water output for each category. The results of the regression analysis showed there is a reasonably high correlation, 0.70 to 0.81, between cost and output. The economic interpretation of the regression results indicated the water industry in Idaho is in Stage I and subject to economies of scale.

LIBRARY U. OF I. URBANA-CHAMPAIGN

ECONOMICS OF PERMANENT FLOOD-PLAIN EVACUATION,
Atlanta City Dept. of Environment and Streets, Ga. Office of Engineering.
N. L. Johnson, Jr.
Journal of the Irrigation and Drainage Division, Proceedings of the American Society of Civil Engineers, Vol 102, No IR3, Proceedings paper No. 12378, p 273-283, September 1976. 6 fig, 2 tab, 10 ref.

Descriptors: *Cost-benefit analysis, *Flood plain insurance, *Flood plains, *Damage, *Annual flood, Average costs, Economic feasibility.
Identifiers: *Economic analysis, House owners.

A method is presented for computation of the average annual damage due to the flooding of structures. The evaluation techniques employed may be used for any area of potential flooding when one seeks to find the benefit/cost ratio of a permanent evacuation from a flood plain area. By using the procedure, the economics of the federally subsidized flood insurance program are evaluated in addition to a permanent evacuation of residents from the flood plain area. The flood insurance is found to be a real economic bargain for the owner of the house. The benefit/cost ratio of certain land-use change plans involving the lower-lying houses is found to be 2.5. Since the benefit/cost ratio of flood insurance is unity, it is concluded that the land use change plan of these lower areas is more feasible than flood insurance. (Bell-Cornell)
W77-08856

RESEARCH BENEFITS IN WATER RESOURCES CONSTRUCTION,
Bureau of Reclamation, Denver, Colo. Engineering and Research Center.
W. P. Simmons, and W. R. Groseclose.
Journal of the Construction Division, Proceedings of the American Society of Civil Engineers, Vol. 102, No. C03, Proceedings paper No. 12421, p 527-534, September 1976. 6 fig, 6 ref.

Descriptors: *Water resources, *Reclamation, Arch dams, Penstocks, Concretes, Pipelines, Plastics, Construction, Spillways, Tunnels, Soil mechanics, *Benefits.
Identifiers: *Bending, Monetary savings.

A diversified research program covering engineering materials, design and construction methods, ecological and sociological factors, and electric power and energy problems is described briefly. Emphasis is then placed on specific examples of engineering research which have benefited construction of the Bureau of Reclamation's water resources-related facilites. Among these are savings of $13,000,000 at Grand Coulee Third Powerplant by determining that the penstock bell-mouth entrances could be made much smaller than previous practice allowed, a $25,000,000 savings by using a three-centered arch instead of a circular arch for Auburn Dam, a $2,500,000 savings by reducing the amount of cement at Coulee Third Powerplant by using pozzolans and water-reducing agents, and as yet undetermined savings through a cooperative program with industry in proving the value of and defining working limits for reinforced plastic mortar (RPM) pipe for water distribution systems and of corrugated plastic pipe for drainage systems. INTEGRATED EVALUATION PROGRAMS FOR FAIRFAX COUNTY, VA.,
Fairfax County Office of Comprehensive Planning, Va. Director's Office.
J. Reid.
Journal of the Urban Planning and Development Division, Proceedings of the American Society of Civil Engineers, Vol. 102, No. UP1, Proceedings paper 12332, p 137-145, August 1976. 1 tab.

Descriptors: *Land use, *Planning, *Population, *Zoning, *Evaluation, *Programs, *Virginia, Drainage, Sewers, Transportation.
Identifiers: *County planning.

The growth of Fairfax County, Virginia is examined. County planning must be an accomodation between continued residential demand and the retainment of the historic, scenic, and environmental character of the county. Fairfax County has developed a response to the problem of rapid growth through the organization of a Planning and Land-Use System (PLUS), which will be capable of generating continuously updated data, policy alternatives, flexible responsive plans, implementation programs, and an effective set of regulatory measures for the county. (Bell-Cornell)

WATER SUPPLY ECONOMICS,
Municipal Environmental Research Lab., Cincinnati, Ohio. Water Supply Research Div.
R. M. Clark.
Journal of the Urban Planning and Development Division, Proceedings of the American Society of Civil Engineers, Vol. 102, No. UP1, Proceedings paper 12357, p 213-224, August 1976. 5 fig, 4 tab, 11 ref.

Descriptors: *Water supply, *Regional analysis, *Costs, Cost analysis, Evaluation, Facilities, Water quality, Economies of scale, *Economics.
Identifiers: *Decentralization, Economic analysis, Economic surveys, Scale effect, Location theory.

Water supply systems are generally composed of: (1) collection works; (2) purification works, where needed; and (3) transportation and distribution systems. There is much controversy over which economic arguments can be applied to water supply; e.g., it is often said that water supply exhibits significant economies of scale, thereby justifying larger and larger systems. This may be true when considering the purification works, but it does not necessarily apply to the total treatment and distribution system. In this paper, representative cost data collected from one of a series of case studies being conducted by the EPA are presented. These data should be useful in evaluating the relative economic impact and importance of the various components in the system. A suggestion is made as to the way in which the cost of water varies throughout the distribution system. (Bell-Cornell)

ANALYSIS OF SUPPLY AND DEMAND OF URBAN ORIENTED NONRESERVOIR RECREATION.
Institute for Water Resources (Army), Fort Belvoir, Va.
IWR Research Report 76-R2, U.S. Army Corps of Engineers, Institute for Water Resources, Fort Belvoir, Virginia, November 1976. 98 p, 4 fig, 17 tab, 45 photos, 13 ref, 2 append.

Descriptors: *Water resources development, *Recreation demand, *Estimating, *Benefits, *Methodology, Supply, Demand, Recreation facilities, Research, Planning, Model studies, Equations, Systems analysis, Flood control, *California.
Identifiers: *Recreation use, *Recreation activities, *American River Parkway(Sacramento California), Use prediction, Data base, Economic value, Travel cost approach, Unit value approach, Urban-oriented recreation, Recreation use models.

This report contains the results of U.S. Army Corps of Engineers research into the supply and demand of urban-oriented nonreservoir recreation. It is an interim report on an initial phase of a comprehensive effort underway within the Corps to develop methodologies, procedures, and guidance for the estimation of recreation use and benefits for nonreservoir water resource development projects. The specific objectives of the researchers were to develop a data base on use and users of urban recreation facilities which are water related but nonreservoir projects and to prepare estimating equations which produce reasonable and supportable estimates of recreation use and demand. Presented is a methodology for estimating recreation use and benefits in planning nonreservoir water resources development. Recreation activity hour-estimating models are developed from data on the American River Parkway, Sacramento, California. A narrative-pictorial and statistical description of the recreation areas is given. Application of the models is illustrated and two approaches to estimating the economic value of a nonreservoir recreation area are demonstrated. It is concluded that the analysis models and methodology for use prediction and benefit estimation developed through the described phase of research need to be duplicated and validated in other locations to insure general applicability in recreational water resources planning. The value of recreation as an economic good can be approximated from activity estimators by using appropriate travel costs as proxy for prices paid by users or by systematically considering the criteria recommended for unit day value determination. WATER--AN ELEMENT OF LAND-USE AND URBAN GROWTH POLICIES,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Water Resources Research Center.
W. R. Walker, and W. E. Cox.
Journal of the Urban Planning and Development Division, Proceedings of the American Society of Civil Engineers, Vol 102, No UP1, Proceedings paper 12339, p 81-94, August 1976. 11 ref.

Descriptors: *Land use, *Water resources, *Planning, Sediments, Water pollution, Water supply, Potable water.
Identifiers: *Regional planning, *Urban growth, Single-purpose planning.

This article reviews the interrelationship between land and water. What is done with our land has a significant impact on what happens to our water. Different types of systems are used to increase the goodness in quality of our drinking water. Chlorination of water supplies is mentioned concerning the problem that adding this chemical to disinfect water supplies does give rise to carcinogenic materials being present in drinking water. The causes of some of our water problems and land use problems have been brought about by single-purpose planning; moreover, planning processes have not been adequately implemented due to a lack of perception of the importance of land management by the public. In conclusion, better land and water management could be facilitated with changes in existing institutional arrangements, modifications in cost-sharing policies, better use of tax incentives, more effort devoted to public education, and the adoption of a new land ethic. ECONOMIC DEVELOPMENT AND ENVIRONMENTAL QUALITY IN THE NORTHEASTERN PLATEAU REGION OF CALIFORNIA,
California Univ., Davis. Dept. of Agricultural Economics.
W. Johnston, L. Jackson, and D. Hansen.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-269 105, Price codes: A03 in paper copy, A01 in microfiche. California Water Resources Center, Davis, Report No. 40, June, 1977. 37 p, 3 tab, 10 ref. (California Water Resources Center Project UCAL-WRC-W-465). OWRT B-164-CAL(1).

Descriptors: *Land use, *Water utilization, *Alternate planning, *Alternate water use, Water resources development, Planning, Management, *California, *Economics, *Environment evaluation, *Recreation, *Administrative agencies.
Identifiers: Modoc County(Calif).

Part I: Evaluating land and water resource use options of alternative development possibilities requires knowledge of regulatory, proprietory and administrative agencies and their functions with respect to local water resources. Modoc County, California is used as a demonstration area to inventory and provide insights into the roles played by more than 70 federal; state, and local agencies as they affect water related aspects of recreational and retirement motivated subdivision developments. Twenty-eight possible functional responsibilities relevant to water resources are evaluated for each agency. Part II: Three northeastern countries in California--Siskiyou, Modoc, and Lassen--have attracted varied and extensive recreational subdivision development. The build out rate for developments, the motivation of the purchasers, and the impact of these developments on local resources are important factors in assessing and planning long run resource development and use programs. A survey of selected remote subdivisions provides the basis for evaluating these influences and provides insights into the types of problems likely to arise regarding impact on water resources resulting from such land development activity.

Available from the National Technical Information Service, Springfield, VA 22161 as PB-269 188, Price codes: A03 in paper copy, A01 in microfiche. Report PRJER031-1, June 1976. 36 p, 20 fig, 14 tab, 37 ref. OWRT A-031-UTAH(1), 14-34-0001-6046.

Descriptors: *Power plants, Management, Planning, *Heat exchangers, Mineral water, *Geothermal studies, Evaluation, *Alternative water use, *Energy, Thermal power plants, Design criteria.
Identifiers: Finite resources.

Alternative management strategies for hydropower and geothermal development are myriad. The approach taken in this study is based on the notion of optimum deployment of finite resources. A legitimate question which this study has attempted to address is: Does the construction of large water management facilities, such as hydropower dams, which involve huge amounts of energy, concrete, and steel, constitute an efficient use of basic resources. An energy accounting analysis technique is proposed, and using this procedure energy resource inputs are examined and compared for specific hydropower dams and geothermal power plants. The technique, though promising, still contains certain problems, and further development is needed in order to establish a consistent and uniform methodology. The energy accounting technique indicates that construction of hydropower facilities is a relatively efficient use of basic energy resources. However, because of large evaporation losses from storage reservoirs, water consumption per unit of power produced tends to be high. An analysis subsequent to the energy accounting approach suggests that combining once-through cooling of thermal power plants with pumped storage hydropower facilities could produce large water savings per unit of generated power. Further study of this configuration is recommended. The energy accounting technique also clearly identifies the high efficiency of geothermal power plants in terms of resource deployment. A heat exchanger system design which is capable of utilizing warm and highly mineralized waters is proposed, it is recommended that the design be constructed and tested on a demonstration basis.

LONGITUDINAL ANALYSIS OF CHANGE IN LEVELS OF AFFILIATION AND PARTICIPATION IN VOLUNTARY FORMAL ORGANIZATIONS,
Pennsylvania State Univ., University Park. Dept. of Agricultural Economics and Rural Sociology.
R. G. Harr.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-269 098, Price codes: A04 in paper copy, A01 in microfiche. Master of Science Thesis, June 1973. 65 p, 21 tab, 19 ref, append. OWRT A-017-PA(2), 14-31-0001-3238.

Descriptors: *Social change, *Recreational facilities, *Reservoir construction, Social impact, Social aspects, Psychological aspects, Age, Occupations, *Attitudes, *Social participation.
Identifiers: *Community leaders, *Neighborhood awareness, Affiliation, Formal voluntary organization, Sex, Level of participation, *Longitudinal analysis.

This longitudinal analysis of changes in affiliation and participation levels in formal voluntary organizations over the period of 1960-1970 utilized data from all adults in a rural central Pennsylvania community physically bisected in 1968 by the construction of a flood control reservoir. These changes were related to respondents' sex, age, and occupational status. While participation rates were high in both periods the change data did not indicate stability in either affiliation or participation; in fact, a small decline in both measures was observed. Men were found to be less stable than women. Of the < 40 age group 34 percent decreased their affiliation level while in the > 70 category 81 percent decreased. Occupational status was not related to change. The decline in both affiliation and participation levels between 1960 and 1970 could not with these data be attributed to either national or state-wide trends or to other changes set in motion by the reservoir construction. (Sink-Penn State)

USER CHARGES IN INLAND NAVIGATION POLICY,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Urban Affairs.
C. Cooper-Ruska.
Available from the National Technical Information Service, Springfield, VA as PB-268 798, Price codes: A05 in paper copy, A01 in microfiche. MS thesis, August 1974. 81 p, 82 ref. OWRT B-061-VA(2).

Descriptors: Water policy, *Inland waterways, *Navigation, *Cost sharing, Regulation, Legal aspects, Legislation, Water law.
Identifiers: *User charges.

Policies relative to inland navigation are unique in comparison to those of non-water transport modes. Waterways are considered to be public highways and, historically, one of the advantages of water transportation has been its lower costs due, in part, to a free waterways policy of the Federal Government that is set forth in the Northwest Ordinance and the Constitution. Proposals to impose user chargers on inland navigation therefore must consider the legal basis within which a cost-sharing strategy could be implemented. User charges should foster efficiency, equity, and recovery of costs within the system. Fuel taxes, license fees based on horsepower, segment tolls, lockage fees, and congestion tolls have been recommended. Each of these mechanisms for implementing user chargers is examined to determine if it will pass the legal test of consititutionality.

CONTROL OF NON-POINT SOURCES OF WATER POLLUTION WITHIN AN ECOLOGICAL FRAMEWORK: THE CASE OF THE TRI-COUNTY REGION, MICHIGAN,
Michigan State Univ., East Lansing.
P. A. Nortey.
Ph D Thesis, 1976. 189 p.

Descriptors: *Water pollution control, *Water pollution sources, Public health, Ecosystems, Model studies, Legislation, Planning, Water quality control, Environmental control, Administration.
Identifiers: Water Pollution Control Act Amendments(1972).

A study was conducted on the control of non-point water pollution sources within an ecological framework. A second objective was the evaluation of institutions and institutional planning arrangements for pollution control under Section 208 of the 1972 amendments to the Federal Water Pollution Control Act. Four principles were derived from a conceptual ecosystems model, which involved regional considerations, environmental quality, carrying capacities and tolerances, and sound management practices. The Tri-County Region of Michigan was the study area chosen. The Tri-County Planning Commission's approach was judged to be basically sound. It was sugggested that the Commission be made coordinator of all citizen participation activities relative to water pollution. Ecosystem relationships were suggested as a basis for the identification of water pollution control strategies. A close functional relationship was recommended between the planning agency and the implementing agency. Further investigation is necessary to identify the best combination of incentives for public adoption of compatible water management practices. The Section 208 program was judged to be an effective means of solving Tri-County water pollution problems and aiding better land use and economic community growth. Continuance and improvement of the program was seen as the major challenge. (Collins-FIRL)

PLANASA--A NATIONAL PLAN FOR WATER SUPPLY AND SEWERAGE IN BRAZIL,
Banco Nacional da Habitacao, Rio de Janeiro (Brazil).
A. Klumb.
Journal of the American Water Works Association, Vol. 69, No. 4, p 186-187, April, 1977.

Descriptors: *Planning, *Sanitary engineering, *Water supply development, *Sewerage, Public health, Water quality, Sewage treatment, Waste disposal, Construction, Economics, Research and development, Costs, Urban areas, Rural areas, Governments, Foreign countries.
Identifiers: Brazilian National Sanitation Plan(PLANASA), Brazil.

PLANASA (Brazilian National Sanitation Plan) was developed to mobilize national resources in the quickest time possible for the economical provision of basic sanitation to all Brazilian urban areas. All federal agencies involved with social development have been directed to support the effort. The United States and the Pan American Health Organization are making technical assistance available. The plan calls for a rate structure consistent with the consumer's ability to pay and reduction of operational costs by economies of scale to create a permanent balance between revenues and expenditures. A target date of 1980 has been set for the provision of drinking water to more than 80% of the urban population and for adequate sewerage facilities in major metropolitan regions. At the same time, simpler and more basic services are to be provided for towns and villages of lesser size. Meeting these goals will require a vast improvement of water quality for three-fourths of the municipalities and the expansion and construction of sewage systems. Pooling of resources on a national and state basis will be necessary, as will the training of qualified personnel and the strengthening of sanitation authorities. Means for the development and transfer of technology for the provision of the best possible systems must be devised. The major problem of the future will be to provide an impetus for the population to connect to the systems after their completion. (Collins-FIRL)

THE MANAGEMENT OF INTERNATIONAL BOUNDARY WATERS OF CANADA AND THE UNITED STATES: A COMPARATIVE STUDY,
Cornell Univ., Ithaca, N.Y. Dept. of Civil and Environmental Engineering.
L. B. Dworsky.
Natural Resources Journal, Vol. 15, No. 1, p. 223-227, January 1975. 10 ref.

Descriptors: *Management, *Administration, *Institutional constraints, *Comprehensive planning, *Great Lakes, *International commissions, *International Joint Commission, Political aspects, Administration, Budgeting, Legislation, *Canada, *United States.
Identifiers: *Boundary waters(Canada-US).

The article discusses improved management of the Great Lakes in order to make it more effective and to meet current and emerging questons. The International Joint Commission (IJC) is seen as the only formal arrangement between the U.S. and Canada that is broad enough to handle this problem. The major conclusions are to strengthen the IJC, and, to establish a new treaty for the Great Lakes apart from the IJC. These suggestions provide for: (1) establishing a joint Canadian-U.S. management body for the Great Lakes having surveillance and mediation functions; (2) joint agency budget and administrative procedures; (3) power to initiate planning, surveys, investigations and research under carefully specified guidelines; (4) program responsiveness by requiring that the activities of the joint management body be subject to program and budget authorization on a regular basis; (5) facilitating joint planning on a multiple purpose basis; (6) stressing intensive regional and transborder collaboration among state and provincial governments; (7) developing a more comprehensive and systematic approach to the management of the Great Lakes; (8) joint information collection and analysis; and (9) public reporting. It is also suggested that the boundary problems are similar to those existing between Mexico and the U.S., and that a Mexican-U.S. boundary commission be set up. (Nessa-NC)

FLORIDA'S SOVEREIGNTY SUBMERGED LANDS: WHAT ARE THEY, WHO OWNS THEM AND WHERE IS THE BOUNDARY,
G. J. MacGrady.
Florida State University Law Review, Vol. 1, No. 4, p. 596-644, Fall 1973.

Descriptors: *Florida, *Boundary(Property), *Riparian rights, *Ownership of beds, Riparian land, Tidal waters, Accretion(Legal aspects), Avulsion, Erosion, Navigable waters, Water law, Water rights, Legislation, Common law, Riparian waters, Shores, High water mark, Real property.
Identifiers: *Submerged lands, *Public trust doctrine, Sovereignty lands.

This note discusses the history, definition, ownership, and regulation of Florida's sovereignty lands--those lands beneath navigable fresh and tidal waters--together with the problems involved in demarcating their boundaries from abutting riparian lands. The sovereignty lands are held in public trust by either the state or federal government, whereas riparian lands are usually privately owned. Since the state's shorelines are constantly shifting, it has been difficult to establish a satisfactory method of boundary determination between the sovereignty and riparian lands. The author provides a detailed discussion of the scientific aspects of tidal phenomena, which is helpful to an understanding of the relative merits of ambulatory legal boundaries as opposed to fixed boundaries. Specifically discussed is the use under federal law of the ambulatory mean high tide line as the standard for boundary determination, and whether the use of that standard is mandated under Florida law. Further attention is given to the difficulties caused by Florida's own particular topography in locating such mean high tide line and the effectiveness of judicial and legislative responses thereto. LEGAL BATTLES ON THE CALIFORNIA COAST: A REVIEW OF THE RULES,
National Oceanic and Atmospheric Administration, Washington, D. C. Office of Sea Grant.
G. Bowden.
Coastal Zone Management Journal, Vol 2, No 3, p 273-295 (1976).

Descriptors: *California, *Legal aspects, *Planning, *Land use, *Land development, Land resources, Condemnation, Condemnation value, State governments, Judicial decisions, Property values, Regulation, Coasts, Shores, Shore protection, Land management, Management.
Identifiers: *Administrative regulations, *Coastal zone management, *California Coastal Act.

The California Coastal Act is bound to arouse heated debate and controversy. The Act contains 183 policies that are designed to enumerate priorities and define planning goals. What is not certain, however, is the coming judicial reaction to this bill. Undoubtedly there will be confrontation; the purpose of this article is to anticipate the outcome of the legislative-judicial clash. The analysis covers three areas: (1) property rights, (2) requirements of a valid regulation, and (3) evolving legal doctrines. Also presented are broad guidelines as to California's stands on each of the above. Where property rights are concerned, ever since Euclid v. Amber Realty in 1926 the state courts have allowed local governments to use a wide range of regulatory devices. California rejects the granting of inverse condemnation, preferring instead to rule that a regulation should be changed or eliminated. Finally, the doctrine of vested rights still plays a major role in determining whether a land-owner has properly relied on an existing set of ground rules. (Frank-Florida)

CONCLUSIONS AND RECOMMENDATIONS FOR THE UNITED NATIONS WATER CONFERENCE (PRELIMINARY OUTLINE),
Food and Agriculture Organization of the United Nations, Rome (Italy); and International Association for Water Law. Executive Council.
D. A. Caponera.
In: Proceedings of the International Conference on Water Law & Administration, International Association for Water Law, February 8-14, 1976, Caracas, Venezuela; Published by the Commission for the National Water Resources Development Plan (Coplanarh), Caracas, Venezuela, p 1283-1292, 1976.

Descriptors: *Water resources development, *Technical societies, *United Nations, Conferences, Water law, Organizations, Governments, Legal aspects, Social aspects, Management, Natural resources, Ground water, Planning, Coordination, Dynamic programming, International law, Conservation, Water conservation, Education, Training, Administration.
Identifiers: *United Nations Water Conference, *Second International Conference on Water Law and Administration.

The United Nations Water Conference should, in its consideration of the world's water resources and needs, initially examine the current status and recent tendencies in water law. The most recent data shows a trend toward resource-oriented water management, and an elimination of the private water concept in favor of a public water resources regime. Using a multi-disciplinary approach to water resources law will result in viewing it as an instrument for the implementation of overall water policy. The conference should evaluate the role of planning as a tool in water resources management. The transfer to resource-oriented management calls for basin planning as the essential process in water economy. Aside from its impact on the planning process, resource-oriented water management has created a need for new legal and institutional criteria focusing on politico-administrative necessities. The general decline in water quality, demands concern for environment-oriented legislation. The lack of qualified manpower stands as a major constraint to the effective development of any water resources management program. (Moorhouse-Florida)

PROCEEDINGS OF THE INTERNATIONAL CONFERENCE ON GLOBAL WATER LAW SYSTEMS, SEPTEMBER 1-9, 1975, VALENCIA, SPAIN.
Proceedings of the International Conference on Global Water Law Systems, September 1-9, 1975, Valencia, Spain, 4 vol, 1451 p. Published by Colorado State University, Ft. Collins, Colorado 80523. $40.00 or $10.00 microfiche. Order from Conference Director, George E. Radosevich, Dept. of Economics.

Descriptors: *Water quality control, *Water allocation(Policy), *Water management(Applied), Water law, Economics, Administration, Social aspects, Adoption of practices, Legal aspects, Comprehensive planning, Coordination, Governments, Leadership, Planning, Political aspects, Water policy, International law, Regulation.
Identifiers: *International conference, *Global water law systems.

The International Conference on Global Water Law Systems which convened in Spain focused upon particular issues basic to analyzing and improving water laws in light of the role and function of the law and its relationship to other disciplines and sectors of socioeconomic activity. The conference was an effort designed to: (1) build upon materials assembled in past meetings and publications while attempting to establish a systematic foundation of knowledge of major water law and administration systems around the globe; (2) to develop an analytical methodology for the interface of interdisciplinary, intersectoral and intergovernmental inputs to new or improved laws and codes. Among the water law systems studied were the Spanish, French, British, Italian, Soviet, Hindu-Bali, Moslem, Latin-American, Israeli and the variations found in the United States and select Asiatic countries. Three key issues or problems identified as an impediment to water resources optimization were discussed in light of needed changes in the law: (1) allocation and reallocation of water supplies; (2) integration of water quality and quantity control; (3) management and conjunctive use of ground and surface waters. CHANGES URGED AT NCWQ HEARINGS,
P. S. Ward.
Journal Water Pollution Control Federation, Vol 48, No 2, p 230-33 (February 1976).

Descriptors: *Permits, *Financing, *Water pollution control, *Water Pollution Control Federation, Regulation, Federal government, Federal-state water rights conflicts, State governments, Control, Legislation, Federal jurisdiction, State jurisdiction, Legal aspects, Water quality control, Water pollution, Costs, Loans, Research and development, Benefits, Economic efficiency, Federal Water Pollution Control Act.
Identifiers: *Hearings, National Commission on Water Quality, Point sources(Pollution), Non-point sources(Pollution).

Recent hearings of the National Commission on Water Quality (NCWQ) produced testimony on a number of major issues. The witnesses generally acknowledged the necessity for meeting the technological goals designated by the Federal Water Pollution Control Act (FWPCA), but felt the 1983 deadline was too severe. The Water Pollution Control Federation (WPCF) recommended that Primary Table II and permit responsibilities be delegated to the states on request, but subject to a federal audit. While industry insisted that NCWQ had underestimated the costs associated with water pollution control programs, environmental organizations asserted that benefits accruing from those same programs had been underestimated. WPCF also recommended a flexible federal funding rate 'not to exceed 75 percent' to permit a given amount of federal money to be spent more effectively. Witnesses feared that progress achieved through the control of point source discharges may be nullified by increasing nonpoint pollution. Other issues which emerged concerned dwindling research and manpower training efforts, and the federal government's failure to commit itself to a long-term funding program, in support of water pollution control. (Rieck-Florida)

WHAT 208 PLANNING CAN DO: A LOCAL AND FEDERAL VIEW,
P. S. Ward.
Journal Water Pollution Control Federation, Vol 48, No 7, p 1692-96, July 1976.

Descriptors: *Federal Water Pollution Control Act, *Governmental interrelations, *Government

supports, *Planning, Water law, Regulation, Local governments, Federal government, Legal aspects, Inter-agency cooperation, State governments, Administrative agencies, Methodology, Priorities, Decision making.
Identifiers: *Federal Water Pollution Control Act Amendments of 1972, *PL 92-500, *Non-point sources(Pollution), Waste water management, Sanctions, Funding, Data base, Water planning.

At the federal level the emphasis of section 208 of PL 92-500 is placed on the production of specific outputs. One such output is expected to result in solutions to problems, such as nonpoint sources, that are not adequately addressed by the permit program or the construction grant program. The federal concept of Section 208 having definite regulatory functions differs from that found at a local level. In the Houston area section 208 is reviewed as a data base and a methodology for decision making. Impediments to section 208 at the local level revolve around time and money. The requirement of extensive review is an important safeguard, but it is a liability in terms of time. The Environmental Protection Agency (EPA) sees the slow paced political process as being a major hindrance. In the area of sanctions, neither level has developed adquate penalties to insure compliance. At the local level the prognosis for section 208 succeeding is good, as a result of high visibility, public participation, thorough review, and input from local officials. At the federal level the prognosis is guarded. The minimum goal is for a plant to produce on thirty percent of its planned output within a two year period. (Petruff-Florida)

ENFORCEMENT OF MUNICIPAL PERMITS: PORTENT OF PROBLEMS,
J. T. Sliter.
Journal Water Pollution Control Federation, Vol 48, No 3, p 422-24 (March 1976).

Descriptors: *Federal Water Pollution Control Act, *Permits, *Municipalities, Discharge(Water), Industries, Legal aspects, Administrative agencies, Control, Legislation, Regulation, Financing, Treatment facilities, Industrial plants, Water pollution, Education, Penalties(Legal), Law enforcement.
Identifiers: *Federal Water Pollution Control Act Amendments of 1972 (FWPCA Amendments of 1972), *Administrative regulations, Dischargers.

A lack of adequate resources coupled with complexities and inconsistencies in the Federal Water Pollution Control Act (FWPCA) Amendments has created a system of negotiations, cooperation and forbearance. The Environmental Protection Agency's (EPA) enforcement efforts of National Pollution Discharge Elimination System (NPDES) permits differs between industry and municipalities. Among the reasons for the discrepancy is the fact that most permits to publicly owned treatment plants have only been issued in the last year or two. The pragmatic impossibility of meeting unrealistic permit requirements is another reason for the EPA's lax enforcement efforts. Another major impediment that shields cities is their political immunity and the nature of local financing. The agency has been more prone to educating the discharger than taking enforcement actions against him. The enforcement program is at a proverbial crossroad. Whether is becomes a major force or simply a farce depends upon the reasonableness of both its actions and the law it must enforce. Perhaps the most pressing issue then, is the need for extending the 1977 deadline. According to the National Commission on Water Quality it may take until 1985 to achieve substantial compliance. (Rieck-Florida)

PL 92-500: NEW FEDERALISM OR FEDERAL TAKEOVER,
A. S. Heid.
Journal Water Pollution Control Federation, Vol 48, No 2, p 238-40 (February 1976).

Descriptors: *Federal-state water rights conflicts, *State governments, *Administrative decisions, Legal aspects, Legislation, Administrative agencies, Coordination, Decision making, Governments, Political aspects, Water policy, Regulation, Federal government, Water law, Governmental interrelations.
Identifiers: *Federal Water Pollution Control Act Amendments of 1972, PL 92-500.

The Federal Water Polluton Control Act (FWPCA) Amendments of 1972 are a classic case of federal takeover stemming from Congress' dissatisfaction with cleanup efforts by the states. Examination of the Act's early implementation stages indicates that the Environmental Protection Agency (EPA) initially attempted to direct the entire effort rather than work cooperatively with the states. It has been a case of Congress enacting and the EPA implementing uniform national legislation rather than a flexible federal law. This is demonstrated in the Act's verbosity, its attempt to mandate specific requirements and deadlines for the EPA and the states, and the desire to have something for everbody. In addition, the states have so far been unable to influence many of the EPA's crucial implementation decisions that further erode their freedom of action. The Environmental Protection Agency defines which methods are 'reasonable', 'practical' or 'best available'. It succeeds in controlling the process while failing to stick to the Act's schedule. Many of those involved pay only lip service to the concept of intergovernmental sharing of responsibility and power. Legislators are apparently more concerned with costs of environmental controls rather than governmental power principles. (Rieck-Florida)

SPILL PENALTIES DRAW CRITICISM,
J. T. Sliter.
Journal Water Pollution Control Federation, Vol 48, No 2, p 236-37 (Feb 1976).

Descriptors: *Chemicals, *Penalties(Legal), *Impaired water quality, *Economic impact, Negligence, Legal aspects, Assessments, Law enforcement, Regulation, Water pollution, Federal Water Pollution Control Act, Water pollution control, Water pollution sources, Economic justification, Insurance, Barges, Transportation, Chemical industry, Legislation.
Identifiers: Spills, Misconduct, Administrative regulations, Hazardous substances.

The Environmental Protection Agency (EPA) recently proposed rules to deal with spills of hazardous chemicals and other materials in waterways. It designated more than 300 chemicals as hazardous materials and set fines and penalties that may range from $500 to $5 million in case of a spill. Some people fear the maximum penalty will normally be no more than $5,000 per spill, regardless of its severity. The EPA has 2 options in assessing penalties. It can either charge between $500 and $5,000 per spill or base the fine on the number of units spilled multiplied by a penalty rate established by the agency. The agency recently announced that only when the discharge is the result of gross negligence or misconduct will it apply the more severe penalty. The agency is thus attempting to provide an economic incentive to prevent the spill of hazardous materials while simultaneously trying to reduce adverse economic impact on industry. There are serious questions over whether these proposed minor penalties will be an effective deterent to spills of hazardous chemicals. (Rieck-Florida)

AS AN INCIDENT OF NATIONAL SOVEREIGNTY, THE UNITED STATES HAS PARAMOUNT RIGHTS AND POWER IN THE SEABED AND SUBSOIL OF THE OUTER CONTINENTAL SHELF,
S. O. Spinks.
Georgia Journal of International and Comparative Law, Vol 5, p 580-588 (1975).

Descriptors: *Water resources development, *Submerged Lands Act, *Legislation, *Continental Shelf, *Federal-state water rights conflicts, Judicial decisions, Legal review, Natural resources, Oil wells, Federal government, State governments, Federal jurisdiction, State jurisdiction, Legal aspects, Continental margin, Oceans, Oil fields, Natural gas.

The Supreme Court, in a 1975 case, held that where a conflict existed between the federal government and 13 Atlantic Coast States as to ownership of rights on the Continental Shelf, the federal government should prevail. The practical effect of this decision was to vest in the federal government ownership of the Continental Shelf's rich oil deposits at a point beginning three miles from shore. It is not certain that the federal government really desired this effect; the author points out that Congress may pass legislation mitigating the severity of this decision toward the states by following the Submerged Lands Act of 1953. The effect of that act was to nullify a prior Supreme Court decision that gave ownership of all submerged lands within the three-mile belt seaward of the tidelands to the federal government. Although legally the federal government does have absolute rights to all Continental Shelf deposits, it may be politically impractical for the states to be left out altogether. (Frank-Florida)

A RATIONAL NATIONAL POLICY ON PUBLIC USE OF THE BEACHES,
House, Washington, D.C.
R. C. Eckhardt.
Syracuse Law Review, Vol 24, No 3, p 967-88 (Summer 1974). 1 append.

Descriptors: *Seashores, *Public rights, *Beaches, *Easements, *Public access, Legal aspects, Legislation, Common law, Civil law, Coasts, Sands, Shores, Federal government, Littoral, State governments, State jurisdiction, Alabama, California, Connecticut, Florida, New Jersey, New York, Oregon, Texas, Washington.
Identifiers: *Coastal waters, *Contiguous zone, *Coastal zone management, *Sovereign immunity, Open Beaches Bill.

Congressman Bob Eckhardt (D-Texas) has proposed national legislation to ensure the American public's right to enjoy front lands. The Eckhardt Bill, H.R. 4932, guarantees, consistent with property rights of littoral landowners, free and unrestricted public use of ocean beaches. In support of the bill Eckhardt compares common law aspects of beach ownership to recent developments in case law in Texas, Oregon, New Jersey and other states. The controversy of public access concerns itself not only with who has title to the land in dispute, but also with the problem of how to define the area of dry sand beach sought to be protected. Different states have used various stan-

dards and rules of common civil law to define who owns title to the areas in question. The passage of this bill would clarify federal public policy and would demonstrate federal recognition of a difference between ownership and the right of public access to the sea. H.R. 4932 would allow the states to protect the use of the beaches and provide funds for the purchase of beaches for the public; the states would retain all control over such beaches acquired by law or by condemnation. PORTER--COLOGNE WATER QUALITY CONTROL ACT.
Cal Water Code Ann secs 13000 thru 13361 (West 1971), as amended, (Supp 1976).

Descriptors: *California, *Administrative agencies, *Regulation, *Legislation, *Water Quality Act, Water quality control, Waste disposal, Water pollution, Water quality, Water quality standards, Law enforcement, Water policy, Legal aspects, Social aspects, State governments, Political aspects, Penalties(Legal), Permits, Water permits, Control, Management, Water law, Permits.
Identifiers: *Porter-Cologne Water Quality Control Act, Injunctions(Prohibitory), Notice, Administrative regulations.

In order to provide for the health, safety and welfare of its people, California has established state and regional water quality boards. The boards will be composed of gubernatorial appointees who will serve four year terms. The state board shall oversee regional boards and develop comprehensive long range water policy. The state will be divided into nine regions. Each regional board will have nine members drawn from such backgrounds as agriculture, industry, government and environmental organizations. Regional boards will hold public hearings, make investigations and issue policy statements relating to any water quality matter within its jurisdiction. The regional boards will also aid the state board in establishing the overall water quality policy. Additionally, the regional boards will control local waste discharge programs. The boards will assess the impact of the discharge of waste into state waters, and issue permits regulating the amount of discharge. Such permits may be enforced by fine or injunction. The board may also force any permit violator to pay the cost of clean-up. Any person disagreeing with the action of the regional board may appeal to a court of competent jurisdiction. TO EXTEND THE MARINE PROTECTION, RESEARCH, AND SANCTUARIES ACT (HEARING ON S 3147 TO EXTEND THE ACT 2 YEARS).
Hearings---Sub Comm on Oceans and Atmosphere--Comm on Commerce, US Senate, April 12, 1976, Serial No 91-83. 153 p.

Descriptors: *Water pollution sources, *Waste disposal, *Sewage sludge, *Oceans, Legal aspects, Administrative agencies, Administrative costs, Sampling, Sediments, Coasts, Continental shelf, Cost allocation, Dredging, Industrial wastes, Outfall sewers, Permits, Pollutant identification, Pollutants, Sludge disposal, Sludge treatment, Wastes.
Identifiers: *Coastal waters, *Hazardous substances, *Congressional hearings, *Ocean dumping, Funding.

Bill S.3147 proposes to extend the Marine Protection, Research, and Sanctuaries Act for two years and to allocate $4.8 million per year for fiscal years 1977 and 1978. The thrust of the testimony heard on April 12, 1976 was concerned with the problems associated with ocean dumping of sewage sludge, industrial wastes and dredge spoils. Witnesses included representatives from the Environmental Protection Agency (EPA), Maryland Department of Natural Resources, General Accounting Office, University of Southern California, US Army Corps of Engineers, National Wildlife Federation, Ocean City, Maryland, US Coast Guard, and the National Oceanic and Atmospheric Administration. Most of the testimony was concerned with the hazards of the present ocean dumping policy and the need for improved monitoring techniques as well as viable alternatives to this method of waste disposal. The hearing was adjourned without any action by committee. (Morse-Florida)
W77-08981

AMEND THE MERCHANT MARINE ACT OF 1920 (HEARINGS ON S 2422 TO INCLUDE THE VIRGIN ISLANDS WITHIN THE SCOPE OF THE ACT WITH RESPECT TO TRANSPORTATION OF OIL AND OIL PRODUCTS).
Hearings---Sub Comm on Merchant Marine--Comm on Commerce, US Senate, February 25, March 30, 1976. Serial No 94-75. 99 p.

Descriptors: *Virgin Islands, *Oil, *Ships, *Transportation, Costs, Cost comparisons, Legislation, United States, Federal government, Administrative agencies, Water law, Legal aspects, Cost analysis, Economics, Economic feasibility, Foreign countries, Foreign trade.
Identifiers: *Congressional hearings, Vessels, Petroleum products, Merchant Marine Act of 1920.

The proposed bill to amend the Merchant Marine Act of 1920 would apply to the Virgin Islands petroleum trade the provisions of section 883 of title 46 of the United States Code limiting the transportation of merchandise by water between points in the United States to vessels built in and documented under the laws of the United States. The measure is limited to crude oil, residual fuel oil, and refined petroleum products. Other merchandise, commodities or passengers are not affected by the legislation. The United States Department of the Interior opposes the enactment of the bill, since the principal effect of the bill would substitute shipping by American vessels for the substantial volumes of petroleum presently carried by foreign ships. Foreign vessels are considerbly less expensive than American, and oil transported by American ships costs substantially more. The department believes that the enactment of the bill would raise petroleum costs of American consumers and would injure the economic health and development of the Virgin Islands. (Rieck-Florida)

SITE EVALUATION AND PRECONSTRUCTION TESTING AT POTENTIAL DEEPWATER PORT LOCATIONS.
Coast Guard, Washington, D. C.
Federal Register, Vol 41, No 79, p 16798-801, April 22, 1976.

Descriptors: *Harbors, *Coastal structures, *Port authorities, *Ships, *Oil industry, Deep water, Bodies of water, Engineering structures, Transportation, Navigation, Water pollution sources, Navigable waters, Oceans, Oil, Oil pollution, International waters, Administrative agencies, Regulation, Governments, Administrative decisions.
Identifiers: *Deepwater Port Act of 1974, *Environmental impact statement, *Rulemaking, *Deepwater ports, *Ports, Tankers, Shipping, Coastal zone.

The procedural regulations concerning license applications under the Deepwater Port Act of 1974 have been amended to require that advance notice and site evaluation reports be furnished to the Coast Guard by any individual engaged in deepwater port site evaluation or preconstruction testing, and to establish a mechanism whereby the Commandant may regulate these activities. The regulations as originally proposed had required advance notice, but had not prescribed specific control measures. In response to public comment that the original proposal offered no assurance that such activities would be conducted in a manner consistent with the Act, the Coast Guard developed a second proposal requiring prior approval and expanding the control mechanism governing suspension, revocation, and cancellation of site evaluation authorizations. The response to the second proposal was that the legislative history of the Act itself showed no intent to require prior approval. The Coast Guard agreed and eliminated the requirement from the amendment. In its final form, the rule requires that written notice must be submitted to the Commandant, U.S. Coast Guard, 10 days prior to the commencement of any activity; it specifies the kinds of activities which may be undertaken without submission of additional information; and it delineates conditions under which the Coast Guard may order suspension or prohibition of activies. LIBRARY U. OF I. URBANA-CHAMPAIGN

UNITED STATES V 62.61 ACRES OF LAND, MORE OR LESS, IN CITY OF VIRGINIA BEACH, COMMONWEALTH OF VIRGINIA (A COMPENSABLE PROPERTY RIGHT AS MIGHT EXIST IN A WHARF OR PIER WILL NOT BE FOUND IN A JETTY CONSTRUCTED IN NAVIGABLE WATERS),
547 F2d 818-21 (4th Cir 1977).

Descriptors: *Virginia, *Riparian rights, *Navigable waters, *Jetties, *Condemnation, Real property, Coastal structures, Legal aspects, Banks, Economics, Value, Riparian waters, Bodies of water, Ownership of beds, Piers, Judicial decisions, Water law, Chesapeake Bay, Bays, Compensation, Easements.
Identifiers: *Property interests, *Property rights.

Plaintiff property owners in a United States condemnation suit claimed compensable interest in a stone jetty extending 800 feet from their land into Chesapeake Bay. The jetty had been built by the Pennsylvania Railroad under a federal permit thirty-eight years before plaintiffs acquired the property to which the jetty abutted. The deed granting title to the property had contained a catchall clause conveying rights to any interest the grantor had in 'muds, flats and land under the water of Chesapeake Bay'. The United States District Court and the Fourth Circuit Court of Appeals held that the original interest of the railroad, under federal permit, was a non-conveyable easement and that the land on the bottom of Chesapeake Bay is owned by the State of Virginia. The lower court held, and the appeals court affirmed, that rights 'to extend a wharf or pier are not to be equated to a jetty'. Ownership of a wharf or pier is normally a compensable riparian right, as such structures are bilt from the shore outward for the purpose of reaching navigable waters, and are mere appurtenances to the shore. A jetty is distinguishable both by its primary function, which is to protect a channel entrance, and by its construction, which incorporates it into the water's floor. (Sloan-Florida)
W77-08990

ALMEDA COUNTY WATER DISTRICT V NILES SAND AND GRAVEL COMPANY, INC. (USE OF CORRELATIVE RIGHTS DOCTRINE TO DEFEAT CLAIM OF INVERSE CONDEMNATION),
112 Cal Rptr. 846-55 (Ct App 1974).

Descriptors: *California, *Percolating water, *Eminent domain, *Reasonable use, *Condemnation, Groundwater, Subsurface waters, Competing uses, Relative rights, Excavation, Dewatering, Compensation, Judicial decisions, Water districts, Legal aspects, Water law, Water rights, Water shortages.
Identifiers: *Injunctive relief, *Inverse condemnation, Groundwater management.

Appellants operated sand and gravel quarries overlying the Niles Basin; respondent was a county water district whose water replenishment program raised the underground water table to a level below which appellants' pits had been excavated, causing flooding in the pits. Appellants pumped out and discharged several billion gallons of that water into San Francisco Bay. Evidence that the public's water needs were critical throughout California and the district was in the record. Appellants sued the district for compensation under inverse condemnation, alleging that the flooding of the pits constituted a 'taking' of property for public use. Respondents sought to enjoin the operators from discharging and wasting its water. The appellate court here affirmed the trail court's decision in favor of the district. It held that the doctrine of correlative rights--where the rights of the water of each landowner overlying the basin are limited by his reasonable use thereof--was a public servitude that had existed upon appellants' property; injunctive relief was justified by the finding that appellants' pumpoff and discharge of water amounted to an unreasonable use thereof. (Jones-Florida)
W77-08991

SZELES--NATALE, INC. V BOARD OF COMMISSIONERS OF SWATARA TOWNSHIP, DAUPHIN COUNTY (FLOOD CONTROL AIDED BY LAND DEVELOPMENT RESTRAINTS),
368 A2d 1336-38 (Cwth Ct Pa 1977).

Descriptors: *Administrative decisions, *Supervisory control(Power), *Permits, *Flood control, *Pennsylvania, Administrtive agencies, Building codes, Ponding, Ponds, Legislation, Regulation, Land development, Land use, Land management, Judicial decisions, Flood protection, Local governments, Surface waters.
Identifiers: *Administrative regulations, Plats, Flood retention ponds.

Plaintiff developer sought review of an order dismissing his appeal from the denial of plat approval by defendant township board of commissioners. Plaintiff, relying on an ordinance which established a township planning commission, claimed that the ordinance delegated authority to the commission to grant final plat approval. Defendant claimed that the ordinance gave the commission advisory powers only, and that the defendant retained power of final plat approval. The court held for the defendant, finding that the board had reserved approval power for itself. The court further found that the controverted plat was preliminary in nature, rather than final. Plaintiff also contended that the defendant abused its discretion by relying on testimony of expert witnesses in its decision to deny the permit. Defendant asserted the possibility of flooding and the possible adverse effects of ponds proposed by the plaintiff. The court found that this issue resolved itself into a question of the credibility of experts, thus it refused to declare that the defendant had abused its discretion by giving greater weight to the testimony of one expert over that of another. Nor did the court accept the plaintiff's contention that the denial of this development plan amounted to an unconstitutional deprivation of land. (Petruff-Florida)

IN RE CITY OF WHITE BEAR LAKE (STANDARD FOR GRANTING OF PERMITS UNDER THE MINNESOTA WATER MANAGEMENT LAW).
247 NW2d 901-07 (Minn 1976).

Descriptors: *Minnesota, *Permits, *Water management, *Standards, Judicial decisions, Legislation, Legal aspects, Legal review, Water law, Administrative decisions, Natural resources, Administrative agencies, State governments, Regulation, Land management, Conservation, Construction.
Identifiers: Evidence.

The Commissioner of natural resources appealed from an order and judgment of the Ramsey County District Court reversing the commissioner's order denying respondent city's application for a permit to encroach upon the bay of a lake to construct a roadway. The district court found that a 1973 amendment to the Minnesota Water Management Law, stating that in all permit applications the applicant has the burden of proving that the proposed project is reasonable, practical and will adequately protect the public safety, created a higher standard for granting of permits. The Supreme Court determined that the amendment did not create a higher burden because the amendment was only a restatement of a well-established rule of administrative law. The only other issue in the case was whether there was sufficient evidence before the commissioner to support a denial of the permit. The Supreme Court found that where there was substantial evidence before the commissioner that pollution, impairment, or destruction of natural resources would occur as a result of the granting of the permit, and feasible alternatives were available, the commissioner's denial of the permit was justified. (Hilburn-Florida)

WATER RIGHTS ADJUDICATION ACT.
Tex. Water Code Ann secs 5.301 thru .341 (1972).

Descriptors: *Water utilization, *Water management, *Texas, Water control, Water demand, Water distribution(Applied), Water policy, Water resources, Water supply, Water allocation(Policy), Beneficial use, Consumptive use, Riparian rights, Municipal water, Administration, Water districts, Water law, Legal aspects, Water permits.
Identifiers: Watermaster, Water Rights Adjudication Act.

The stated purpose of this statute is to require recordation of claims of water rights in the state of Texas, to limit such claims to actual use, and to provide for adjudication and administration of such claims. The statute treats existing claims under previous statutory law and common law riparian rights, and establishes a procedure for the filing of new claims. Also provided for is a system for administering water rights and investigating and adjudicating claims. Among the specific provisions are: water divisions, to be created throughout the state; appointment of a watermaster for each water division; duties and regulatory powers of the watermasters; and provision for notice and appeals procedures for parties whose rights are subject to determination under the statute. The statute allows broad discretionary powers to vest in the Water Rights Commission. (Sloan-Florida)
W77-08994

UNLAWFUL USE, DIVERSION OR WASTE OF STATE WATER.
Tex Water Code Ann secs 5.081 thru 5.121 (1972).

Descriptors: *Texas, *Watershed management, *Water management(Applied), *Appropriation, *Water rights, Canals, Irrigation systems, Water utilization, Water sources, Water supply, Water law, Legal aspects, Administration, Water policy, Agriculture, Governments, Regulation.

Subchapter C of the Texas Water Code establishes regulations for taking, appropriation, or diversion of water. Possession of state water when the right to its use was not acquired in accord with the regulations is prima facie evidence of a violation. A separate offense is committed for each day a person takes water in violation of the Code. No permanent water rights may be sold without a previously perfected right or a permit. No person may transfer water from one watershed to another without a permit. No person may interfere with a headgate or water box, or other work which is the property of another without lawful authority. No person may allow water to be impounded in a manner that damages the property of another; any person whose property is so damaged has remedies at law and in equity. The Texas Water Commission may make and enforce regulations in regard to diversion of floodwaters released from a reservoir on an international stream. No person may allow Johnson gross or Russian thistle to go to seed within ten feet of a waterway lying on his land. No person may pollute or allow anything but a beneficial use of, water contiguous to a canal or irrigation system. No person may obstruct a navigable stream. (Sloan-Florida)
W77-08995

SNAKE RIVER INTERSTATE COMPACT.
Idaho Code Ann sec 42-3401 (Supp 1976).

Descriptors: *Idaho, *Wyoming, *Interstate compacts, *Interstate rivers, *Water resources development, Interstate, State jurisdiction, State governments, Water allocation(Policy), Water distribution(Applied), Water resources, Flood control, Drainage programs, Drainage area, Preferences(Water rights), Governmental interrelations.
Identifiers: *Snake River Interstate Compact.

In October of 1949 Idaho and Wyoming approved the Snake River Compact. The agreement sought to: achieve efficient use of the Snake River; provide for the equitable distribution of its waters; eliminate interstate controversies; promote interstate comity; recognize that the development of the drainage area of the Snake River and its tributaries is the most efficient utilization of such waters; and to achieve joint action with the United States in the control of floods and the development and use of such waters. The waters of the Snake River are allocated between the two states for storage or direct diversion. Waters diverted into either state may not be used outside of specified drainage areas without the approval of the other state. The waters of the Snake River may be impounded for the generation of power, but this use shall be subservient to domestic, stock, or irrigation uses. Each state, and the United States, may construct or use works within the compacting states. The failure to fully utilize provided allocations shall not constitute a forfeiture of such rights to use. (Josepher-Florida)
W77-08996

HEADGATES AND MEASURING DEVICES: DISTRIBUTION OF STORED WATER.
Idaho Code Ann secs 42-701 thru 42-802 (1948).

Descriptors: *Idaho, *Water distribution(Applied), *Water measurement, *Water level recorders, *Water management(Applied), Measurement, Water levels, Water delivery, Water transfer, Water level fluctuations, Water conveyance, Streambeds, Diversion dams, Diversion structures, Appropriation, Control structures, Controlled drainage.
Identifiers: Headgates, Measuring devices.

Appropriators or users of the public waters of Idaho must maintain headgates and controlling works at the point where the water is diverted. These works should be constructed so as to allow state officials to regulate the flow of the water at the diversion point. Measuring devices may also be required by the state to determine the amount of water diverted from streams into ditches. Plans for headgates, rating flumes or other measuring devices must be approved by the state. Appropriators or users who refuse to maintain or construct satisfactory controlling works will have their water supply shut off after reasonable notice has been given. Persons using any streams or channels or tributaries thereof, as impounding reservoirs shall place measuring devices at suitable intervals on said waters. Measuring devices shall be installed at a point above and near to the backwater of impounding reservoirs. Owners desiring to use the bed of a stream or a natural water course to convey stored water shall notify the state which will then adjust the headgates of ditches not entitled to such water to insure that the owner will secure his entitled volume. Persons interfering with such adjustments of headgates may be punished by fines and imprisonment. (Josepher-Florida)
W77-08997

DISTRIBUTION OF WATER AMONG APPROPRIATORS.
Idaho Code Ann secs 42-601 thru -607 (1948), as amended, (Supp 1976).

Descriptors: *Idaho, *Water distribution(Applied), *Water management(Applied), *Water districts, *Water allocation(Policy), Water delivery, Prior appropriation, Measurement, Water levels, Canals, Ditches, Water measurement, Local governments, Water sources, Water utilization, Water policy, Appropriation.

Idaho is divided into three geographically determined water divisions to facilitate the administration and control of public waters. The department of reclamation has immediate direction and control of the distribution and diversion of water from all streams to canals and ditches. The distribution of waters is in accordance with rights of prior appropriation. The department shall divide the state into water districts. Each district is to have an independent source of water supply so that separate districts do not compete for uses from a single water source. District meetings and procedures are provided for. The department may request watermasters to file reports containing information regarding the district's present and future water supplies and needs. In times of water scarcity, the watermaster shall distribute waters from the district based on prior rights of appropriation. Persons who do not own adjudicated rights are accorded subsequent rights. (Josepher-Florida)
W77-08998

GROUND-WATER USE ACT (REGULATION OF GROUND WATER RESOURCES THRU A PERMIT SYSTEM).
Hawaii Rev Stat secs 177-1 thru -35 (1968).

Descriptors: *Hawaii, *Groundwater resources, *Groundwater availability, *Groundwater, Legislation, Water management(Applied), Water supply, Water resources development, Recharge, Water utilization, Water pollution, Beneficial use, Domestic water, Prescriptive rights, Permits, Regulation, Water permits, Water law, Competing uses, Water allocation(Policy).
Identifiers: Administrative regulations, Certification, Groundwater management, Domestic use, Preserved use.

The board of land and natural resources of the state of Hawaii is herein authorized to designate ground water areas subject to regulation if any of the following conditions exist: (1) the use of ground water exceeds the rate of recharge; (2) ground water levels are declining excessively; (3) chloride content is materially increasing; (4) excessive preventable waste is occurring; or (5) proposed development would lead to one of the above. No person shall make any use of the water of an area so designated except as provided in this act, nor can any prescriptive rights to water resources accrue therein. Domestic uses of ground water in designated areas may continue and new domestic use may be initiated upon filing a report with the board. Any other existing beneficial uses may be preserved by filing a detailed declaration of use with the board and receiving certification of the same. Such preserved uses will be extinguished if not used for four consecutive or five of seven years. Any other withdrawal of water from a designated area may be made only upon issuance of a permit. Such permits shall be granted for beneficial uses not interfering with preserved and domestic uses or more beneficial uses where there is water available. The act further provides numerous procedural safeguards to insure the proper designation of areas, consideration of permits, and exercise of emergency powers. (Moorhouse-Florida)
W77-08999

MOLOKAI IRRIGATION AND WATER UTILIZATION PROJECT.
Hawaii Rev Stat secs 175-1 thru - 8 (1968).

Descriptors: *Hawaii, *Irrigation programs, *Water supply, *Comprehensive planning, Legislation, Development, Area redevelopment, Governments, State governments, Administrative agencies, Potential water supply, Water allocation(Policy), Competing uses, Water utilization, Multiple-purpose projects, Economics, Financing, Planning, Irrigation, Irrigation districts.
Identifiers: *Molokai Irrigation and Water Utilization Project, *Hawaii board of land and natural resources.

Tkhe state of Hawaii has established a special irrigation and water utilization project for the island of Molokai. The project will be administered by the board of land and natural resources. The board shall have all powers of eminent domain, the power to survey and conduct all necessary studies in relation to the project, and the power to lay and collect assessments from the acreage served. All funds collected from the operation of the project will be segregated into a special fund in the state treasury and will be used exclusively for the Molokai project. No actual construction of the project shall be authorized until all lands and water rights necessary for the project are satisfactorily under the board's control. (Moorhouse-Florida)

MIANUS RIVER PRESERVATION COMMITTEE V. ADMINISTRATOR, ENVIRONMENTAL PROTECTION AGENCY (JURISDICTION OF FEDERAL APPEALS COURT FOR PERMITS ISSUED BY STATE AGENCY UNDER NPDES).
541 F.2d 899-910 (2d Cir. 1976).

Descriptors: *Federal jurisdiction, *Connecticut, *Administrative agencies, *Permits, Legal review, Adjudication procedure, Federal government, State government, State jurisdiction, Regulation, Administrative decisions, Co-ordination, Governmental interrelations, Interagency cooperation, Control, Judicial decisions.
Identifiers: *Federal Water Pollution Control Act Amendments of 1972, Administrative regulations, State pollution permits.

Petitioner environmental committee sought review in the United States Court of Appeals of a National Pollution Discharge Elimination System (NPDES) permit issued by the Commissioner of the State of Connecticut Department of Environmental Protection. A local water company had for many years discharged chemically treated flocculants into a nearby river. The state agency mandated completion of facilities for reduction of the discharges, and subsequently extended the compliance date. When the 1972 Amendments to the Federal Water Pollution Control Act (FWPCA) became effective, permitting transfer of the responsibility for issuing discharge permits to complying state agencies. Connecticut's program was approved, and the orders pertaining to the water plant apparently transformed into NPDES permits. Petitioner alleged noncompliance with the FWPCA directive for best practicable control technology, and impossibility of compliance. Respondent state agency defended on the merits and alleged lack of jurisdiction, as the review provision provides only for federal review of the federal administrator's action. The court dismissed the action for lack of jurisdiction holding that state permitting programs were not an unconstitutional delegation of the Administrator's authority and that no Administrator's action was involved in the state permit modification. (Molloy-Florida)

COMMONWEALTH OF MASSACHUSETTS V. UNITED STATES VETERAN'S ADMINISTRATION (NOTICE OF SUIT PROVISIONS OF THE FWPCA; FEDERAL COMMON LAW NUISANCE ACTIONS).
541 F.2d 119-23 (1st Cir. 1976).

Descriptors: *Massachusetts, *Federal Water Pollution Control Act (FWPCA), *Permits, *Jurisdiction, Federal government, Administration, State governments, Legal review, Waste treatment, Governmental interrelations, Administrative agencies, Control, Regulation, Water pollution, Abatement, Effluents, Hospitals.

LIBRARY U. OF I. URBANA-CHAMPAIGN

Identifiers: *National Pollutant Discharge Elimination System, *Notice, *Nuisance(Legal aspects), Federal Water Pollution Control Act Amendments of 1972, Federal common law, Sovereign immunity.

Plaintiff state brought suit in federal district court alleging that Veterans Administration Hospital had violated the conditions of its National Pollution Discharge Elimination System (NPDES) permit issued under the Federal Water Pollution Control Act (FWPCA). The Veterans Administration conceded its failure to comply with the timetable for re-in to the municipal sewage system, and therefore its technical violation of the permit, but denied jurisdiction. The FWPCA provides that no action may be commenced prior to 60 days after the plaintiff has given notice of the alleged violation. Plaintiff gave only 40 days notice, and alleged on appeal that since no amount of administrative action during the post notice period could cure the past violations of the permit conditions, no purpose would be served by deferring recourse to the courts. The United States Court of Appeals for the First Circuit noted that administrative action could still hasten compliance with the permit, and found that sovereign immunity barred action under the difficult issues involved in the federal common law of nuisance. Finding that the FWPCA's waiver of immunity applied only to actions under the FWPCA, the court affirmed dismissal of the action. (Molloy-Florida)
W77-09002

HOMEOWNERS EMERGENCY LIFE PROTECTION COMMITTEE V. LYNN (ENJOINING OF MAJOR FEDERAL ACTIVITY WITH ALLEGED INADEQUATE ENVIRONMENTAL IMPACT STATEMENT).
541 F.2d 814-19 (9th Cir. 1976).

Descriptors: *Dams, *Environmental control, *Administrative agencies, *California, Federal government, Project planning, Water supply, Financing, Government finance, Grants, Governmental interrelations, Water resources development, Projects, Disasters, Earthquakes.
Identifiers: *Environmental impact statement(EIS), *Injunctive relief.

Plaintiff, unincorporated association of homeowners and taxpayers, sought to enjoin the construction of a dam and reservoir project by the City of Los Angeles. City applied for Federal Disaster Relief to replace the dam after an earthquake had destroyed the old one. Before relief was granted, the city elected to go ahead with construction and to ultimately finance the project with local water reserve bonds if federal financing was denied. Plaintiff then alleged that the project was a major federal action requiring the filing of an environmental impact statement (EIS). During the plaintiff's appeal, federal agencies filed the EIS and the federal funding was granted. The court noted that the issuance of the federal grant made the project a major federal action and concluded that the grant was made under a 1970 act and did not contain a 1974 exemption from Environmental Protection Agency requirements. The EIS must consider all reasonable alternatives. The compliance and issue was remanded to the trial court for a factual determination. The trial court was also instructed to reconsider whether construction should be enjoined until that factual determination was made. (Molloy-Florida)

MC CORMICK V LAWRENCE (CONSTITUTIONALITY OF NEW YORK STATUTE AIMED AT PROMOTING GOVERNMENTAL INTEREST IN PRESERVING APPEARANCE OF AN AREA).
387 NYS2d 919-20 (App Div 1976).

Descriptors: *New York, *Parks, *Aesthetics, *Permits, Judicial decisions, Legislation, Legal aspects, Water law, Governments, Preservation, Land use, Natural resources, Land management, State governments, Construction, Administrative agencies, Administrative decisions, Constitutional law.
Identifiers: *Administrative regulations.

Landowners sought review of a decision of the Adirondack Park Agency prohibiting them from constructing boathouses on their property. Petitioners owned property within the boundaries of the Adirondack Park. In order to develop this tract of land, petitioners were required by the Executive Law to apply for an Adirondack Park Permit. The Agency approved development with the condition that no boathouses be constructed on the shores of the lake. Petitioners commenced pleadings to have respondent's determination amended to permit the erection of boathouses. The Supreme Court granted respondent's motion to dismiss the petition and for summary judgment. On appeal petitioners contended that the statute granting the Agency the authority to impose conditions in permits was an overbroad delegation of power. Petitioners also argued that the Agency's determination was arbitrary and capricious. The Appellate Division found that the legislation provides sufficient standards to guide the Agency in its determinations and that the Agency's restriction forbidding construction of boathouses based on adverse aesthetic effect, was not arbitrary, capricious, or an abuse of discretion. (Hilburn-Florida)

RYKAR V GILL (STATE'S REFUSAL TO ALLOW UPLAND OWNER TO FILL ADJACENT MARSHLAND BECAUSE OF OWNER'S ACCESS TO DEEP WATER BY USE OF WHARFING TECHNIQUES),
6 ERC 1333-35 (Conn Super Ct 1973).

Descriptors: *Connecticut, *Deep water, *Constitutional law, *Land forming, Land use, Land development, Dredging, Water rights, Water quality control, Water policy, Water pollution control, Environmental control, Environmental engineering, Marsh management, Marshes, Wetlands, Water law, Water control.
Identifiers: *Fill permits, *Coastal waters.

Plaintiff landowner brought this action seeking a reversal of the state's denial of his application for a dredge and fill permit to allow plaintiff to fill the adjacent marshland and construct a deep harbor facility. Plaintiff contends that the denial of his present application deprives him of his right to access to deep water, which is one of the exclusive yet qualified rights of an upland owner. Plaintiff further contended that such right is deemed a property right and entitled to constitutional protection, including compensation when these rights have been taken by the state. The court upheld the earlier finding that plaintiff was not the owner of a portion of the wetlands. The court further held that if access to deep water could be gained by means other than filling, then it cannot be found to be an unreasonable exercise of the police power for the state to foreclose the marsh destruction and deny the fill permit application. Here the plaintiff could have access to deeper water via wharfing out, and the fact that wharfing out may be more costly is not of constitutional significance. The state's refusal to issue the permit was therefore upheld by the court as a reasonable exercise of its police power. (Welch-Florida)
W77-09005

MC ILRAY V HAMILTON (PERMISSIVE USE OF SPRING OVERFLOW DEFEATS PRESCRIPTIVE RIGHT CLAIM),
539 SW2d 669-78 (Mo Ct App 1976).

Descriptors: *Missouri, *Judicial decisions, *Prescriptive rights, *Spring waters, Water law, Legal aspects, Real property, Easements, Land tenure, Riparian rights, Legal review, Water rights, Farms, Springs, Bodies of water, Overflow, Subsurface waters, Adjacent landowners.
Identifiers: Injunctive relief, Permissive use, Easement by prescription.

Plaintiff, executor of landowner's estate, sought a permanent injunction to restrain adjoining landowners from blocking a roadway across their farm and from diverting natural flow of water from a spring located on their farm. Plaintiff argued that through open, notorious, uninterrupted, and adverse use of the roadway and spring water for over 10 years, decedent had acquired an easement by prescription. Defendants, admitting use by plaintiff, contended that such use had its origin in permission, and thus could not ripen into a prescriptive right. The trial court found defendant's theory supported by the evidence, and denied the injunction. On appeal, the court affirmed the denial of injunctive relief finding the pipe extending onto defendants' land was a permissive intrusion because defendants' predecessor in title determined where the pipe could be located and how the overflow from his trough could be captured. Plaintiff asserted a second theory for relief on appeal claiming riparian rights based upon a reasonable use of natural watercourses. The court of appeals refused to consider the argument stating that an appellant must seek review of the trial court's judgment on the same theory on which the case was tried. (Moorhouse-Florida)

MODINE MANUFACTURING CO V POLLUTION CONTROL BOARD OF ILLINOIS (STREAM RECLASSIFICATION AND EFFLUENT VARIANCES REQUIRED BY NEW WASTE TREATMENT TECHNOLOGY),
351 NE2d 875-79 (Dist Ct App 111 1976). 5p.

Descriptors: *Illinois, *Rivers, *Judicial decisions, *Industrial wastes, *Effluents, Water pollution, Administrative agencies, State governments, Legal review, Permits, Legal aspects, Water law, Wastes, Water pollution sources, Discharge(Water), Sanitary engineering, Waste water(Pollution), Chemical wastes, Industrial plants, Industrial water, Water quality.
Identifiers: *Illinois Pollution Control Board, *Modine Manufacturing Company, *Illinois Environmental Protection Act, Effluent limitations, Administrative regulations.

Plaintiff-manufacturer who discharged his treated effluent into an Illinois river, was developing a new waste water treatment facility which required a temporary variance from state effluents standards and a reclassification of the river to secondary-contact water. Defendant Pollution Control Board of Illinois initially granted both requests, but on rehearing reversed the secondary-contact water classification. Plaintiff appealed, contending that the Control Board was an administrative agency, created by statute, which could only conduct rehearings when specific statutory authority existed. The court pointed out that Section 5(d) and Section 26 of the Environmental Protection Act authorized the Board to establish its own rules. Secondly, plaintiff contended that the river fit the definition of secondary contact water since it was dry at times and therefore unable to support a diversified acquatic biota. The Court ruled that a diversified biota could be preserved in the mud during dry times, and re-occur when the river flowed again. Therefore, a non-continuous river flow would not affect the river's classification. The court upheld the Board's ruling that the river was for general use. (Moorhouse-Florida)

UNITED STATES V HOLMES (WATERS AND SUBAQUEOUS AREAS LOCATED WITHIN PERIMETERS OF A MILITARY POST),
414 F Supp 831-44 (D Md 1976). 102 p.

Descriptors: *Riparian rights, *Ownership of beds, *Prescriptive rights, *Military reservations, Public lands, Maryland, Federal government, State governments, Governmental interrelations, Trespass, Public access, Navigable waters, Legislation, Eminent domain, Preferences(Water rights), Priorities, Public rights.
Identifiers: Public trust doctrine, Subaqueous areas.

Defendant was indicted under federal statute prohibiting persons from entering military reservations for an unlawful purpose. Defendant was given a citation by military police when she was located between the high and low water marks on the shores of the Bush River on Aberdeen Proving Grounds, Maryland. The state of Maryland filed an amicus brief in support of defendant's motion to dismiss. Defendant argued that the public has a right to go on subaqueous areas regardless of who owns title to the adjacent land, and that the state had retained jurisdiction over the inland waters. The court found that Congress intended waters and subaqueous lands to fall under the statute's jurisdiction in view of regulations authorized for navigable waterways in target practice area s. The United States was found to hold title to the land and waters acquired through the eminent domain power. The state may have had a claim to subaqueous lands, but vesting of title in the federal government was not dependent on compensation. Ownership of subaqueous lands on United States Military Reservations vests in the federal government, and the state retains no rights for the public use. (Molloy-Florida)

PROVO-JORDAN RIVER PARKWAY AUTHORITY.
Utah Code Ann secs 65-10-1 thru -7 (Supp 1975).

Descriptors: *Utah, *Water conservation, *Rivers, *Administrative agencies, Legislation, Recreation, Wildlife, Conservation, Flood control, Reclamation, Flood plains, Water conservation, Water policy, Water utilization, Administration, Legal aspects, Regulation, Water law, Institutions, State governments, Water policy, Water resources, Comprehensive planning, Decision making, Project planning, Leadership, Management, Social aspects.
Identifiers: *Provo-Jordan River Parkway Authority(Utah), *Provo River(Utah), *Jordan River(Utah).

The Provo-Jordan River Parkway Authority and Board is hereby created to establish and co-ordinate programs for the development of recreational areas, wildlife resources, water conservation, flood control, and reclamation, restoration and preservation of points of historical interest along the Provo and Jordan Rivers of Utah and their tributaries, and within their present flood plains. The Authority's powers include the right to acquire real and personal property in the name of the state, constructing and maintaining facilities consistent with the purposes of the act, and operating, leasing or renting lawful property concessions. The Board is comprised of thirteen members, appointed as set forth by statute. Six terms of office expire on March 1, 1977, the balance on March 1, 1979. Successors shall be appointed for terms of four years each. Board members shall only receive travel expenses. The Board has power to establish the programs necessary to implement the policies of this Act, and to promulgate the rules and regulations required to effectuate the purposes of the Act. The Authority shall not permit any construction on the Provo or Jordan rivers or within their flood plains which shall be in violation of any ordinance. The Authority shall not be authorized to administer water rights. (Hadoulias-Florida)

WATER-USE LEASING ACT.
NM Stat Ann secs 75-40-1 thru -7 (1968).

Descriptors: *New Mexico, *Water users, *Competing uses, *Leases, *Water rights, Water demand, Water allocation(Policy), Regulation, Permits, Legal aspects, Contracts, Legislation, Water transfer, Water utilization, Water resources, Water contracts, Water control, Water law, Water conservation, Water supply.
Identifiers: Notice.

Any owner of a valid water right in New Mexico may lease to any person all or any part of the water-use due him under his water right. The use by the owner of the water right shall be reduced by the amount of water so leased, but the owner's water right shall not be affected otherwise by the lease of such use. Upon the lease's termination the water-use rights shall revert to the owner's original use and location. The lease may cover immediate or future water-use rights, but shall not be effective to accumulate water from year to year or to injure other water users. The lease shall not toll any forfeiture of water rights for nonuse, and the initial or any renewal term of lease of water-use shall not exceed 10 years. The lessee must apply to the state engineer prior to his use of such water, and the engineer shall aprove the application if the lessee has shown that his proposed use and location will not impair any existing right to a greater degree than such right would have been impaired by continued use by the owner. Provisions are made in the statute for notice of the lease, protest from any user who believes his water rights will be adversely affected, and for hearings and appeals. (Welch-Florida)

WATER RESOURCES AND WATER UTILIZATION IN ISRAEL,
Office of Naval Research, London (England).
R. Dolan.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A011434, Price codes: A02 in paper copy, A01 in microfiche. May 30, 1975. 14 p, 4 map, 2 tab.

Descriptors: *Irrigation water, *Water shortage, *Water management(Applied), *Brackish water, Water utilization, Permits, Saline water, Impaired water quality, Brackish-water fish, Industrial production, Agriculture, Cost-benefit ration, Water costs, Environmental effects, Desalination, Water distribution(Applied), Water demand, Deserts.
Identifiers: License, *Israel.

Israel, classified as one-half desert, one-quarter semi-arid, and one-quarter subhumid, is geographically similar to parts of California. Water management in Israel is tight. A license is required to use water in significant quantities and a permit is called for in water exploration. Water, stored in a lake, provides necessary supplies for long, dry summers. Since no more fresh water is available, efforts are directed toward better utilization of existing sources, especially in the field of agriculture. The use of brackish water (that having a salinity of 2000 or 3000 ppm) is expected to be a significant contribution. Processing the water is rejected as a viable alternative because of the cost involved. Brackish water, when mixed with fresh water, may be used for industrial and agricultural purposes. Currently, its major use is in commercial fish ponds. However, research is underway to determine the slinity tolerance of a variety of plants. Several serious drawbacks in using the brackish water involve the expense incurred in pumping it out of the ground coupled with dangerous side effects of salt build-up in the fields where it is used. (Rieck-Florida)

SELECTED PROBLEMS IN IDAHO GROUND WATER LAW,
Idaho Univ., Moscow. Coll. of Law.
D. L. Grant.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-269 097. Price codes: A05 in paper copy, A01 in microfiche. Idaho Water Resources Research Institute, Moscow, Legal Report, March 1975, 74 p. OWRT B-019IDA(3) and B-031-IDA(2). 14-31-001-3578, 4076.

Descriptors: *Groundwater, Planning, *Legal aspects, Economics, Pumping, Natural recharge, Management, *Idaho, *Institutional constraints, *Water rights, Legislation, Water law.
Identifiers: *Raft River Valley(Idaho), Pumping lift.

This report deals primarily with two questions: (1) How are rights to use groundwater acquired in Idaho. (2) What legal constraints limit the exercise of groundwater rights in Idaho. The main focus is upon the current Idaho Groundwater Act although historical antecedents are also examined. Groundwater rights are aquired under the appropriation doctrine, as supplemented by a mandatory permit system. The two main constraints upon exercise of a groundwater right are that such exercise may not affect a senior water right contrary to the declared policy of the Act, and that total withdrawals from an aquifer may not exceed the reasonably anticipated average natural recharge. There are a number of unresolved ambiguities concerning the scope of the first constraint. (See also W75-02981)

ENERGY PLANT SITING LEGISLATION,
Idaho Univ., Moscow. Dept. of Civil Engineering.
C. C. Warnick, and P. J. Rassier.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-269 109. Price codes: A04 in paper copy, A01 in microfiche. Idaho Water Resources Research Institute, Moscow, IWRRI information circular No 9, February 1975. 54 p, 2 tab. OWRT A-048-IDA(1).

Descriptors: *Electric powerplants, Powerplants, *Sites, *Legislation, *Idaho, Energy conversion, Legal aspects, Industry, State governmnts.
Identifiers: Idaho energy plants, Siting legislation.

This brief appraisal of energy siting legislation for Idaho presents in part one an analysis and comparison of drafts of two bills that were drafted prior to the beginning of the First Session of the Forty-Third Legislature of the State of Idaho; comments and explanations are presented on particular points of the legislative needs. Part two is a brief survey of other states' legislation with primary emphasis on points that might be worthy of consideration in Idaho. The third part presents two summary tables of comparative information on the legislation, some ideas for alternatives, and reasons for conclusions. This legislation in the draft form will be changing so a caution is made that these studies are still in progress and may change as further study and analysis proceed.

LIBRARY U. OF I. URBANA-CHAMPAIGN

he question of what is the most appropriate poly-making structure for effecting policy change as become increasingly important. The bias ward an integrated and centralized structure as est suited to the task has been and remains a ominant one in the thinking of many who are ositively disposed toward change. This is a istake. The view which associates centralization ith innovation, and fragmentation with stagnaon (or at best only incremental change) is simistic and unwarranted. A part of the difficulty ith the centralist position, is its lack of appreciaon for the complexities of policy and policy ange. Rather than conceive of policy in ideal rms and as a sort of monolithic approach, it has en suggested that more realistic conceptions are policy as a composite of four dimensions of sts and benefits, and of innovation as occurring a disjointed manner. A fragmented system is an propriate mechanism for effecting disjointed inovation. While a fragmented policy-making stem may not facilitate integrated innovation, ch sweeping change is rarely accomplished ithin any type of system. It seems likely that the ed for such change arises in part because of the lative insensitivity from which highly integrated stems suffer. A system which promotes enepreneurship, encourages competition, and inimizes the costs of change tends to increase nsitivity and renders less likely the occurrence debilitating stagnation. WATER AS AN ENVIRONMENTAL CONSTRAINT IN LAND USE PLANNING,
North Carolina State Univ., Raleigh. Dept. of Landscape Architecture.
R. C. Freeman, Jr.
Masters Thesis, November 1976, 83 p., 41 illus., 30 ref.

Descriptors: *Water distribution(Applied), *Land management, *Land use, *Land use planning, *Small watersheds, *Watershed management, *Water supply, Surface runoff, Water yield improvement, Water storage.

Environmental factors affecting the behavior of water are discussed, as well as the dynamics of hydrologic response under varying environmental conditions, and alternative means of controlling the hydrologic response under varying environmental conditions, and alternative means of controlling the hydrologic response characteristics of watersheds. The relationship between these factors and the establishment of an environmentally stable pattern of land uses upon which human communities can be superimposed is explored. A method is developed that would allow stream networks to behave much as they would under natural conditions. It involves infiltrating runoff close to where it is produced in lieuk of sending it somewhere else for surface storage. This method would improve stream quality by utilizing the filtering action of soil, stabilize streamflow, and positively affect ground water supplies where they are important for human consumption. The characteristics of the important elements of water and land use planning are summarized. The systems include watersheds, the hydrologic cycle, soil types, vegetative cover, geomorphology, geology, and land use patterns. The interrelationship of these elements is discussed, and the impact of development on them is explored. (Nessa-NC)

INCIDENCE OF THE BENEFITS AND COSTS OF ENVIRONMENTAL PROGRAMS,
Harvard Univ., Cambridge, Mass.
R. Dorfman.
American Economic Review, Vol 67, No 1 (Proceedings of the Eightyninth Annual Meeting of the American Economic Association, Atlantic City, Sept '76), p 333-340, February 1977. 5 fig, 3 tab.

Descriptors: *Environmental control, *Costs, *Benefits, *Population, *Programs, *Economics, Water pollution control, Water treatment, Air pollution, Pollution abatement, Linear programming, Algorithms, Constraints, Optimization, Systems analysis, Taxes.
Identifiers: Income level, Willingness to pay, Cost minimization, Exactions.

Considered is the distribution among segments of the population of the benefits and costs of programs for protecting the environment. Presented

are some indications of how the benefits and costs of the current program impinge on different segments of the population classified by income level. It is urged that the distribution of costs and benefits be accounted for in selecting and designing programs, and a suggestion is given for doing this. Willingness to pay data can be utilized to calculate the area under each of the demand curves derived, and from that one can compute the average willingness to pay for families in the corresponding income bracket. It is desirable in planning such programs to consider ways of minimizing the amount of redistribution of income which is entailed. Discussed is the problem of figuring out which segments of the population will suffer exactions and which will not. A cost minimizing problem must be solved in which linear programming is used to minimize total exaction from the designated segments, and the constraints are the usual ones plus the requirements that no exactions be imposed on the protected segments and that exactions from designated segments be non-negative. It is concluded that this nation must reconcile itself to highly regressive methods for reducing atmospheric pollution and must redouble its efforts to compensate for them by using methods with progressive incidences for water pollution control. Descriptors: *Environment, *Risks, Decision making, Evaluation, Environmental effects, Model studies.
Identifiers: *Decision theory, *Bayesian statistics, Systems theory, Case study, *Environmental impact statement, *Indentification of uncertainties, *Multiobjective system framework.

The determination of the environmental impact of man's action has many uncertain components. A conceptual framework has been developed to assess the effect of uncertainty on environmental impact statements. A multiobjective system framework utilizing Bayesian decision Theory was developed as a result of the research. As a result salient feature of an Environmental Impact Statement that properly considers uncertainty are given. Decision theory can be used to advantage in aplying this methodology to assess the effect of natural and informational uncerainty. Even the complexity of computational procedures involving a Bayes analysis can be overcome by use of approximations or by simulation. Multiobjective decision making models are necessary to analyze the non-commensurate objectives found in studying environmental impact. Current procedures used to assess environmental impact do not take proper cognizance of uncertainty and the problems of trade off among multiple objectives in the analysis and evaluation of actions affecting the environment. Some scientific and legal concepts such as proof and model validation must be thought of in terms of probability, if optimal decisions are to be made affecting our future environment. The methodology developed by this project shows how uncertain information and scientific models can be used to advantage in planning the future.

Descriptors: *Surveys, Wetlands, Swamps, *Wildlife habitats, *Trapping, *North Carolina, Channeling, Watershed management.
Identifiers: Prechannelization, Unchannelized swamp, Climatological variables, *Trap responses, *Gray squirrel, *Opossum, *Raccoon.

This study represented one part of a prechannelization analysis to assess the effects of stream channelization and wetland drainage on fish and wildlife. The objectives were to identify and quantify some environmental factors that are associated with trap responses of the gray squirrel, raccoon, and opossum relative to age, sex, and capture status. Fifteen climatological variables and 51 physical factors dealing with trap site location were studied during the summer and winter of 1972 and 1973. Evaluations were made utilizing standardized trap lines in two unchannelized swamp watersheds in northeastern North Carolina. High intrinsic variability characterized trap response, although most regression models did not suffer from lack of fit. Adjustments for environmental variation may be required to obtain accurate mark-recapture population statistics for squirrels, raccoons, and opossums, especially when comparing different habitats or areas. REMOTE SENSING OF TURBIDITY PLUMES IN LAKE ONTARIO,
Geological Survey, Reston, Va. Water Resources Div.
E. J. Pluhowski.
Meeting Preprint 2602 presented at the American Society of Civil Engineers National Convention, held in Denver, Colorado, November 3-7, 1975. 28 p, 13 fig, 6 ref.

Descriptors: *Turbidity currents, *Lake Ontario, *Remote sensing, *Satellites(Artificial), *Photography, Littoral drift, Sediments, Thermal stratification.
Identifiers: *LANDSAT images, *Turbidity plumes, Thermal bar.

Space imagery and high-altitude photography provide an effective method of monitoring the dynamics of turbidity plumes in Lake Ontario. The Niagara River plume, as much as 200 square miles (518 sq km) in area, is by far the largest turbidity feature in the lake. Plume analyses corroborate the presence of a prevailing eastward flowing longshore current along the entire south shore of the lake. This current is most persistent at the Oswego River outlet but is quite variable in the Rochester embayment, where rapid shifts in water movement were detected occasionally in LANDSAT images. The position of the spring thermal bar, a zone of maximum density water corresponding to the 4 deg C isotherm, was located near the Niagara River outlet in images obtained during April 1973. WAVE HEIGHT MEASURING DEVICE,
Texaco Inc., New York.
G. E. Mott, and R. L. Skaggs.
U.S. Patent No. 4,000,646, 4 p, 6 fig, 11 ref; Official Gazette of the United States Patent Office, Vol 954, no 1, p 145, January 4, 1977.

Descriptors: *Patents, *Oceanography, *Waves(Water), Ocean waves, Measurement, Monitoring, Instruments.
Identifiers: *Wave height measurement, Wave period.

A wave measuring instrument is used on a dynamically positioned or tethered floating vessel to continuously monitor wave height, wave period and vertical heave of the vessel as the vessel responds to waves, swell and currents. The instrument comprises a measuring device connected to the vessel hull in a submerged position to continuously record the distance between the instrument and the ocean floor as the vessel heaves. A second measuring device automatically gauges and records the normally varying distance between the instrument and the water's surface, which distance results from the usual presence of wave action whether the latter be gradually rolling or relatively turbulent. The respective measurements thus obtained are thereafter integrated and compensated for to provide a relatively accurate record of the actual wave height between trough and crest, the wave period, and the vertical movement or heave of the vessel. (Sinha-OEIS)

HIGH SENSITIVITY FLOWMETER,
Office of the Secretary (Navy), Washington, D.C.
J. R. Olson.
U.S. Patent No. 4,000,648, 7 p, 12 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 954, no 1, p 146, January 4, 1977.

Descriptors: *Patents, *Oceanography, *Ocean currents, *Ocean circulation, Measurement, Instrumentation.
Identifiers: Sensors, Electromagnetic flowmeters.

This invention utilizes spaced electrodes which are located in an electromagnetic field generated by an elongated electromagnetic coil. This elongated coil by reducing the area within the coil provides a relatively strong field for the amount of the electrical current to excite the coil and the configuration has resulted in sufficient uniformity to provide satisfactory sensitivity such that oceanographic flowmeters may be included in oceanographic station-keeping buoys. Additionally, a method of coil winding and construction has permitted the sharing of mutually perpendicular sensors within a common electromagnetic field. This construction has resulted in an instrument sensor with improved sensitivity over known electromagnetic types and requires only a modest amount of electrical power for energization. (Sinha-OEIS)

A REVIEW OF VELOCITY-MEASURING DEVICES,
Geological Survey, Reston, Va. Water Resources Div.
G. F. Smoot.
Open-file report, April 1974. 35 p, 11 fig.

Descriptors: *Current meters, *Discharge measurement, *Flow rates, *Stream gages, *Instrumentation, Evaluation, Reviews, Equipment, Rotating meters, *Velocity.
Identifiers: Drag body current meters, Optical current meter, Deep water isotopic current analyzer, Thermo-velocity meters, Eddy-shedding current meter, Acoustic velocity meter, Doppler-shift velocity meter, Electromagnetic current meters, Rotating-element current meters.

In hydrology the list of velocity-measuring devices is quite large and still growing. A complete discussion of all the various instruments that have been accepted for use over the years or that are

presently being developed to measure the velocity of water is not within the scope of this paper. However, this discussion should provide an understanding of the operating principles and the usefulness of the more important instruments or measuring systems which have already been accepted or which hold great promise. The velocity-measuring instruments discussed range from the relatively simple but quite important mechanical devices such as rotating element current meters and deflection vanes to the highly sophisticated electrical systems such as the electromagnetic and the ultrasonic flow meters. Optical, drag-body, thermo-velocity, eddy-shedding, and doppler-shift current meters, as well as the deep water isotopic current analyzer, are discussed also. The discussion focuses on the principle of operation of each measuring device; on the advantages and disadvantages of its use, either as a general field instrument or in special applications; and on any special problems that still need to be resolved before the potential usefulness of these devices can be fully exploited. (Woodard-USGS)

DEVELOPMENT OF A HYDROLOGIC INFORMATION STORAGE AND RETRIEVAL SYSTEM,
North Carolina State Univ., Raleigh. Dept. of Biological and Agricultural Engineering.
E. H. Wiser.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-268 792, Price codes: A03 in paper copy, A01 in microfiche. Paper presented at 1975 Annual Meeting ASCE, University of Cal., Davis, June 22-25, 1975. 28 p, 1 fig, 6 ref. OWRT A-067-NC(2). 14-31-0001-5033.

Descriptors: *Computer programs, Data storage and retrieval, Climatic data, Storage, Streamflow, Rainfall, Temperature, Hydrologic data, *Information retrieval.
Identifiers: *HISARS, *Hydrologic Information Storage and Retrieval System.

Modellers often find that a substantial part of their time is taken up assembling data, storing it in a computer accessible form and retrieving it as required. Faced with these problems, a computer system for storage, retrieval, and processing of hydrologic, climatological, and related data has been developed at North Carolina State University. The system is known as HISARS (Hydrologic Information Storage and Retrieval System). System characteristics and capabilities are outlined. Data stored in the system include daily streamflow records, daily rainfall records, daily temperature records, hydrographic records of streamflow and rainfall, hourly rainfall records, daily evaporation and wind movement records, daily snowfall and snow depth records, daily event ('days with') records, annual flood peak records, dam characteristics, environmental resources, and water temperature records (evaporation pans). (See also W77-08610 and W75-03316) (Stewart-NC State)
W77-08609

HISARS - HYDROLOGIC INFORMATION STORAGE AND RETRIEVAL SYSTEM - REFERENCE MANUAL,
North Carolina State Univ., Raleigh. Dept. of Biological and Agricultural Engineering.
E. H. Wiser.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-268 802, Price codes: A11 in paper copy, A01 in microfiche. Tech. Bulletin No 215, June 1975. 218 p, 40 fig, 4 append. OWRT A-067-NC(3). 14-31-0001-5033.

Descriptors: Computer programs, *Hydrologic data, Streamflow, Rainfall, Temperature, *Climatic data, *Data storage and retrieval, *Information retrieval.
Identifiers: *HISARS, *Hydrologic Information Storage and Retrieval System(Manual).

A computerized system for storage, retrieval and routine processing of hydrologic data has been developed at North Carolina State University. The system is known as HISARS (Hydrologic Information Storage and Retrieval System). HISARS has been under development for several years, the first version having been operative in July 1969. Although additional features of the system are planned, it is believed that the current version will be useful for a large number of potential users, and this manual is prepared with the intention of making the system more widely available. The system is running on the IBM System/370 Model 165 computer at the Triangle Universities Computation Center, and can be used at any of the remote terminals scattered around the state. Data are stored on magnetic disk packs. By making use of an operating system feature known as the indexed sequential access method together with direct access capabilities of the PL/1 language, HISARS can retrieve any one of approximately 600,000 records directly. This makes it possible to determine weather or streamflow characteristics at any location and at any time for which data are available. It is also possible to compare different locations at the same time and to process records through time at a single location. The following data are now stored by the system: (1) Daily streamflow records; (2) Daily rainfall records; (3) Daily temperature records; (4) Hydrographic records of streamflow and rainfall; (5) Hourly rainfall records; (6) Daily evaporation and wind movement records; (7) Daily snowfall and snow depth records; (8) Daily event ('days with' records; (9) Flood peak records; (10) Dam characteristics; (11) Environmental resources. ANNUAL SUMMARY OF GROUND-WATE CONDITIONS IN ARIZONA, SPRING 1975 T SPRING 1976,
Geological Survey, Tucson, Ariz. Wat Resources Div.
H. M. Babcock.
Water-Resources Investigations 77-10, (open-fi report), January 1977. 2 sheets, 20 ref.

Descriptors: *Groundwater resources, *Wat utilization, *Irrigation, *Water level fluctuation *Arizona, Pumping, Drawdown, Aquifers, Wat wells, Groundwater availability, *Maps, Evalu tion.

Two small-scale maps of Arizona show (1) pum age of ground water by areas and (2) the status the ground-water inventory in the State. A larg map of the State at a scale of 1:500,000 show potential well production, depth to water selected wells in spring 1976, and change in wat level in selected wells from 1971 to 1976. The bri text that accompanies the maps summarizes th current ground-water conditions in the State. Th withdrawal of ground water in Arizona was abo 5.6 million acre-feet in 1975, of which about 4 million acre-feet was used for the irrigation crops. The Salt River Valley and the lower San Cruz basin are the largest agricultural areas in th State. For 1971-75, ground-water withdrawal in th two areas was about 8.3 and 4.7 million acre-fee respectively, and, in general, water levels a declining. Other areas in which ground-wat withdrawals have caused large water-lev declines are the Willcox, San Simon, upper San Cruz, Avra Valley, Gila Bend, Harquahala Plain and McMullen Valley areas. (Woodard-USGS)
W77-08732

AVAILABILITY OF GROUND WATER IN THE MIDDLE MERRIMACK RIVER BASIN, CENTRAL AND SOUTHERN NEW HAMPSHIRE,
Geological Survey, Concord, N. H. Water Resources Div.
J. E. Cotton.
Water-Resources Investigations 76-39 (open-file report), 1976. 1 sheet, 3 ref.

Descriptors: *Groundwater resources, *Groundwater availability, *Aquifer characteristics, *Water quality, *New Hampshire, Water yield, Water supply, Geologic mapping, Hydrogeology, Planning, Water utilization, Land use, *Maps.
Identifiers: *Middle Merrimack River basin(NH).

Sufficient amounts of water to supply single family homes are available from the bedrock aquifer nearly everywhere in the middle Merrimack River basin in central and southern New Hampshire. Relatively thin and narrow, unconsolidated aquifers of sand or sand and gravel commonly capable of yielding more than 200 gallons per minute to properly located and constructed wells are found only in major stream valleys. The map provides a preliminary assessment of the availability of ground water in the basin, as determined by estimating the capability of the aquifers to store and transmit water. On the map, aquifers are rated as having high, medium, or low potential to yield water. Ground water in the middle Merrimack River basin is generally of good chemical quality. Most of it is clear and colorless, contains no suspended matter and practically no bacteria, water may be affected by land-use practices. Degradation of water quality may occur in unsewered residential and village areas, near solid-waste-disposal sites, agricultural land, and major highways. (Woodard-USGS)
W77-08733

RECORDS OF WELLS, WATER-LEVEL MEASUREMENTS, AND DRILLERS' LOGS, RED RIVER VALLEY, LOUISIANA,
Geological Survey, Little Rock, Ark. Water Resources Div.
J. W. Stephens.
Open-file report 76-759, October 1976. 335 p, 1 fig, 10 plates, 30 tab, 1 ref.

Descriptors: *Water wells, *Water levels, *Well data, *Drillers logs, *Louisiana, Aquifers, Basic data collections, Water utilization, *Data collections.
Identifiers: *Red River Valley(La).

This report is a compilation of hydrogeologic data collected through June 1975 as part of the Red River Waterways project in Louisiana. The study was made by the U.S. Geological Survey in cooperation with the U.S. Army Corps of Engineers, New Orleans District, and the U.S. Soil Conservation Service, Alexandria, La. Included are records of 332 wells and test holes, water levels in 324 wells, and drillers' logs of 316 wells and test holes. Most of the data were collected between July 1968 and June 1975. Well locations are shown. All altitudes given in the tables are referenced to mean sea level. (Woodard-USGS)
W77-08734

WATER RESOURCES DATA FOR WASHINGTON, WATER YEAR 1975.
Geological Survey, Tacoma, Wash. Water Resources Div.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-259 197, Price codes: A99 in paper copy, A01 in microfiche. Water-Data Report WA-75-1, August 1976. 684 p, 5 fig, 33 ref.

Descriptors: *Washington, *Hydrologic data, *Surface waters, *Groundwater, *Water quality, Gaging stations, Streamflow, Flow rates, Sediment transport, Water analysis, Chemical analysis, Lakes, Reservoirs, Water wells, Water levels, Sampling, Sites.
Identifiers: Annual State report(Wash).

Water resources data for the 1975 water year for Washington, consist of records of stage, discharge, and water quality of streams; stage, contents, and water quality of lakes and reservoirs; and water levels and water quality in wells and springs. This report contains discharge records for 250 gaging stations; stage only records for 3 gaging stations; stage and contents for 55 lakes and reservoirs; water quality for 124 stations, 27 lakes, and 35 wells; and water levels for 109 observation wells. Also included are 214 crest-stage partial-record stations. Additional water data were collected at various sites, bot part of the systematic data collection program and are published as miscellaneous measurements. These data represent that part of the National Water Data System operated by the U.S. Geological Survey and cooperating State and Federal agencies in Washington. (Woodard-USGS)
W77-08737

WATER RESOURCES DATA FOR MONTANA, WATER YEAR 1975.
Geological Survey, Helena, Mont. Water Resources Div.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-259 198, Price codes: A99 in paper copy, A01 in microfiche. Water-Data Report MT-75-1, August 1976. 604 p, 10 fig, 8 tab, 32 ref.

Descriptors: *Montana, *Hydrologic data, *Surface waters, *Groundwater, *Water quality, Gaging stations, Streamflow, Flow rates, Sediment transport, Water analysis, Chemical analysis, Lakes, Reservoirs, Water wells, Water levels, Sampling, Sites.
Identifiers: Annual State report(Mont).

Water resources data for the 1975 water year for Montana consist of records of stage, discharge, and water quality of streams; stage, contents, and water quality of lakes and reservoirs; and water levels in wells. This report contains discharge records for 213 gaging stations; stage only records for 1 lake station; stage and contents for 9 lakes and reservoirs; water quality for 85 gaging stations, 4 lakes; water levels for 18 observation wells. Also included are 219 crest-stage partial-record stations and 53 smaller reservoirs. Additional water data were collected at various sites, not part of the systematic data collection program, and are published as miscellaneous measurements. These data represent that part of the National Water Data System operated by the U.S. Geological Survey and cooperating State and Federal agencies in Montana. (Woodard-USGS)

GROUND-WATER DATA FOR MICHIGAN, 1975,
Geological Survey, Lansing, Mich. Water Resources Div.
G. C. Huffman.
Michigan Geological Survey Department of Natural Resources, Lansing, 1976. 56 p, 25 fig, 2 tab, 112 ref.

Descriptors: *Groundwater resources, *Water level fluctuations, *Observation wells, *Pumping, *Michigan, Water quality, Water users, Aquifer characteristics, Water yield, Well data, Hydrographs.

This report summarizes data on ground-water levels in 172 observation wells in Michigan, and provides information on well locations, depths, elevations, and aquifers that they tap. Tabulated data include extremes of water levels for 1975 and for the period of record. Also tabulated is the pumpage of most major ground-water users in the State. During 1975, ground-water levels were generally above average in most areas of the State. The high levels are attributed to near or above precipitation for the fourth consecutive year. During the year water levels reached record highs in 22 wells and dropped to record lows in 6 wells. (Woodard-USGS)
W77-08753

INDIANA STREAM-TEMPERATURE CHARACTERISTICS,
Geological Survey, Indianapolis, Ind. Water Resources Div.
W. J. Shampine.
Available from the National Techical Information Service, Springfield, VA 22161 as PB-265 346, Price codes: A04 in paper copy, A01 in microfiche. Water-Resources Investigations 77-6, March 1977. 55 p, 6 fig, 7 tab, 23 ref.

Descriptors: *Water temperature, *Streams, *Indiana, *Computer programs, Forecasting, Methodology, Regression analysis, Fourier analysis, Statistical methods, Data processing, Thermal powerplants, *Data collections.
Identifiers: *Thermal studies, Wabash River(Ind), White River(Ind).

Periodic stream-temperature data collected at 280 different sites in Indiana by the U.S. Geological Survey and the Indiana State Board of Health were analyzed by a simple harmonic-curve-fitting procedure. Calculated harmonic coefficients were related to 23 topographic, basin, and climatic characteristics, and were analzyed by multiple-regression analysis techniques. The mean temperature of the White River at Indianapolis was raised 3.5 deg C above expected ambient levels caused by climatic conditions alone, primarily as a result of discharges from powerplants. In general, the harmonic coefficients depicting annual variability in stream temperatures generated from the Indiana State Board of Health data, collected every 2 weeks, are the same as coefficients generated from the U.S. Geological Survey data, collected every 4-6 weeks. (Woodard-USGS)

COMPILATION OF TEMPERATURE PREFERENCE DATA,
Oak Ridge National Lab., Tenn.
C. C. Coutant.
Journal of the Fisheries Research Board of Canada Vol. 34, p. 739-745, 1977. 1 tab., 75 ref.

Descriptors: *Data collections, Fresh water fish, Marine fish, Juvenile fish, *Fish physiology, *Fish behavior, *Thermal pollution, Water pollution effects, *Temperature, Ecological distribution, Habitats, Reviews, Laboratory tests, *Bibliographies.
Identifiers: *Temperature preference data, *Selection, *Preferendum, Avoidance preferences, Orientation.

This report briefly summarizes current information from field and laboratory studies on temperature selection by fishes, with a tabulation of final temperature preferenda and upper and lower

avoidance temperatures. Data are given on 124 species of marine and fresh water fish. Material presented in tabular form includes species, size or age of fish observed, upper avoidance temperature, final preferendum, lower avoidance temperature, geographical local and literature reference. (Katz)

PROTOTYPE SOFTWARE FOR ON-LINE STORAGE FORECASTING SUPPORTED BY LOAD FORECASTING AND REDUCED SYSTEM REPRESENTATION FOR WATER DISTRIBUTION SYSTEMS,
Systems Control, Inc. Palo Alto, Calif.
D. Bree, Jr.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-265 556, Price codes: T06 mag tape. March 1977, mag tape DOI/DF-77/006. Source tape is in EBCDIC character set. Tape(s) can be prepared in most standard 7 or 9 track recording modes for one-half inch tape.

Descriptors: *Water distribution(Applied), Operations, Computer models, Water demand, Forecasting, Estimating, Water control, Documentation, Methodology, *Computer programs.
Identifiers: *Software, Computer tapes, Punched cards.

Ten computer programs have been used in research in Water System Hourly Demand Forecasting (system wide or by pressure zone), Reduced Representation of Pressure Zone Networks, and on line Storage Forecasting. The programs are prototype FORTRAN code for algorithms that a water utility might desire to implement on an advanced distribution control system. The programs will be usable as they are in an off-line study mode, but will require extensive adaptaton to the individual utility's system and control computer, perhaps including rewriting in another language. The program is written in the FORTRAN programming language for implementation on a UNIVAC 1106/1108 computer using the Exec 8 level operating system. 200K bytes of core storage are required to operate the model. (See also W77-08940 and W77-08941).
W77-08942

WATSIM - A FORTRAN PROGRAM FOR 24 HOUR SIMULATION OF FLOWS AND RESERVOIR FLUCTUATIONS IN WATER DISTRIBUTION NETWORKS,
Systems Control, Inc., Palo Alto, Calif.
D. Bree, Jr.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-265 555, Price codes: T05 in Mag tape. March 1977, mag tape DOI/DF-77/007. Source tape is in EBCDIC character set. Tape(s) can be prepared in most standard 7 or 9 track recording modes for one-half inch tape.

Descriptors: *Simulation analysis, *Water distribution(Applied), *Control systems, *Computer programs, *Networks, Model studies, California, *Reservoir operation, Design data, Storage, Municipal water, Pipes, Valves, *Distribution systems.
Identifiers: *Extended period simulation, *Software, San Jose(Calif), Computer tapes, Punched cards.

The WATSIM program simulates the flow of water in water distribution networks consisting of pipes, pumps, pressure reducing valves, one-way valves, reservoirs, storage tanks, and fluctuating loads. It can be used either to solve for instantaneous flow rates in a network, or to simulate the operation of such a network over an extended period (24 plus hours). This simulation includes changes in reservoir or storage tank levels driven by fluctuating demand, and the operation of time or pressure actuated valves. The program is capable of simulating up to a 500 node, 750 line network in its present version, and can be expanded by redimensioning directly proportional to network size. The program is written in the FORTRAN programming language for implementation on a UNIVAC 1106/1108 computer using the Exec 8 level operating system. 200K bytes of core storage are required to operate the model. (See also W74-05533).

LIMNOLOGICAL INVESTIGATION OF SI LAKES IN SOUTHEAST ALASKA,
Geological Survey, Anchorage, Alaska. Wate Resources Div.; and Alaska Dept. of Fish an Game, Anchorage.
G. A. McCoy, W. W. Wiggins, and A. E. Schmidt. Water-Resources Investigations 76-122, 1976. sheet, 11 ref.

Descriptors: *Limnology, *Alaska, *Lakes *Water quality, *Lake morphometry, Lak morphology, Chemical analysis, Water chemistry Geology, Water temperature, Mixing, Chemica properties, Physical properties, Thermal stratifica tion, Chemical stratification, Nutrients, *Maps.
Identifiers: *Southeast Alaska, Redoubt Lake Blue Lake, Green Lake, Spurt Point Lake, Swa Lake, Osprey Lake.

Limnological data were collected from six lakes i southeast Alaska in 1974. The data include concen trations of major inorganic constituents, nutrients selected trace metals, total organic carbon, an chlorophyll. Vertical profiles of specific con ductance, temperature, dissolved-oxygen satura tion, and pH were drawn. With the exception o Redoubt Lake, all of the lakes are very simila chemically. The small differences in chemica composition probably reflect variations in geolog of the drainage basins, altitudes, and morphomet ric characteristics of the lakes. Productivity is s low in all the lakes that it was not possible to ran the lakes by relative productivity from the recon naissance sampling. Redoubt Lake is meromictic but the others are probably holomictic and dimic tic. (Woodard-USGS)

Descriptors: *Test wells, *Borehole geophysics *Groundwater resources, *Lithologic logs *Hydrogeology, *Florida, Aquifer characteristics Planning, Land use, Urbanization.
Identifiers: *Palm Beach County(Fla).

Test hole data, in Palm Beach County, Florida, in clude lithologic logs from 66 test wells and geophysical logs from 54 test wells. The purpose of the study is to provide the geohydrologic infor

nation needed for water management and land use ecisions, with emphasis on the urbanized eastern art of the county and the readily developable area n the central part. (Woodard-USGS)
W77-09073

WATER RESOURCES DATA FOR MISSISSIPPI, WATER YEAR 1975.
Geological Survey, Jackson, Miss. Water Resources Div.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-257 659, Price codes: A23 in paper copy, A01 in microfiche. Water-Data Report MS-75-1, May 1976. 528 p, 4 fig, 3 tab, 10 ref.

Descriptors: Mississippi, *Hydrologic data, Surface waters, *Groundwater, *Water quality, Water resources, Gaging stations, Streamflow, Flow rates, Water wells, Water levels, Lakes, Reservoirs, Sampling, Sites, Water analysis, Chemical analysis, Sediments.

Water resources data for the 1975 water year for Mississippi consist of records of stage, discharge, and water quality of streams; stage, contents, and water quality of lakes and reservoirs; and water levels of wells. This report contains discharge records for 78 gaging stations; stage records for 15 of these gaging stations; stage only records for 4 gaging stations; contents for 4 lakes and reservoirs; water quality for 13 gaging stations and 72 miscelaneous sites; and water levels for 47 observation wells. Also included are data for 136 crest-stage partial-record stations and stage records for 5 discharge stations for the period October 1971 to September 1974 and for 4 stage-only stations for the period January 1972 to September 1974 and for 1 stage-only collected at various, not part of the systematic data collection program, and are published as miscellaneous measurements. These data represent that part of the National Water Data System operated by the U. S. Geological Survey and cooperating state and Federal agencies in Mississippi. (Woodard-USGS)
W77-09074

WATER RESOURCES DATA FOR NORTH DAKOTA, WATER YEAR 1975.
Geological Survey, Bismarck, N. Dak. Water Resources Div.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-259 277, Price codes: A19 in paper copy, A01 in microfiche. Water-Data Report ND-75-1, September 1976. 431 p, 3 fig, 2 plates, 4 tab, 32 ref.

Descriptors: *North Dakota, *Hydrologic data, Surface waters, *Groundwater, *Water quality, Gaging stations, Streamflow, Flow rates, Sediment transport, Water analysis, Chemical analysis, Lakes, Reservoirs, Water wells, Water levels, Sampling, Sites.
Identifiers: Annual State report(ND).

Water resources data for the 1975 water year for North Dakota consist of records of stage, discharge, and water quality of streams; stage, contents, and water quality of lakes and reservoirs; and water quality in wells. This report contains discharge records for 146 gaging stations; stage for 13 lakes and reservoirs; water quality for 13 gaging stations, 10 partial-record flow stations, 11 lakes, and 25 wells. Additional water data were collected at various sites, not part of the systematic data collection program, and are published as miscellaneous measurements. These data represent that part of the National Water Data System operated by the U.S. Geological Survey and cooperating State and Federal agencies in North Dakota. (Woodard-USGS)

WATER-RESOURCES INVESTIGATIONS IN KENTUCKY, 1976.
Geological Survey, Louisville, Ky. Water Resources Div.
Available from U.S. Geological Survey, Reston, VA 22092. 1976. 1 sheet.

Descriptors: *Water resources, *Investigations, *Inter-agency cooperation, *Kentucky, Surveys, Planning, Hydrologic data, Basic data collections, Streamflow, Runoff, Groundwater, Water quality, Flood plains, Precipitation(Atmospheric), On-site investigations, Bibliographies, Networks, Maps.
Identifiers: *Cooperative water-studies program.

Water-resources studies and investigations made in Kentucky during 1976 by the U.S. Geological Survey in cooperation with State and local agencies are summarized. A bibliography of selected material concerning these investigations is included. The investigations include collections of basic information through a hydrologic data network, areal hydrologic or interpretative studies, and research projects. The hydrologic data network consists of surface-water stations, groundwater observation wells, and water quality observation sites. Small State maps give a broad picture of variations in some of the hydrologic characteristics pertaining to Kentucky's water resources. A larger map shows the hydrologic data network and investigations in the State. (Woodard-USGS)
W77-09078

WATER-RESOURCES INVESTIGATIONS IN WISCONSIN, 1976.
Geological Survey, Madison, Wis. Water Resources Div.
Available from U.S. Geological Survey, Reston, VA 22092. 1976. 1 sheet.

Descriptors: *Water resources, *Investigations, *Inter-agency cooperation, Wisconsin, Surveys, Planning, Hydrologic data, Basic data collections, Streamflow, Runoff, Groundwater, Water yield, Water quality, On-site investigations, Dissolved solids, Precipitation(Atmospheric), Sediment transport, Bibliographies, Networks, Maps.
Identifiers: *Cooperative water-studies program.

Water-resources studies and investigations made in Wisconsin during 1976 by the U. S. Geological Survey in cooperation with State and local agencies are summarized. A bibliography of selected material concerning these investigations is included. The investigations include colections of basic information through a hydrologic data network, areal hydrologic or interpretative studies, and research projects. The hydrologic data consists of surface-water stations; groundwater observation wells, and water quality observation sites. Small State maps show principal sources of groundwater mean annual precipitation, suspended-sediment yield, average annual runoff, discharge of the principal rivers, and dissolved solids in ground and surface waters. A larger map shows the hydrologic data network and investigations in the state. (Woodard-USGS)

WATER-LEVEL RECORDS FOR THE SAN LUIS VALLEY OF COLORADO, 1973-77,
Geological survey, Lakewood, Colo. Water Resources Div.
R. D. Penley.
Open-file report 77-265, March 1977. 12 p, 2 fig, 1 tab.

Descriptors: *Groundwater resources, *Water wells, *Water levels, *Aquifers, *Water level fluctuations, Basic data collections, Planning, Irrigation, *Colorado.
Identifiers: *San Luis Valley(Colo).

Water-level measurements were made in 122 wells in San Luis Valley, Colo., during January 1977. Changes in water levels from January 1976 to January 1977 ranged from a rise of 10.0 feet (3.0 meters) to a decline of 8.6 feet (2.6 meters) both of which occurred in Costilla County. Measurements for the three preceeding winters are included to illustrate longer term water-levels changes. These data can be used by well owners for planting their irrigation schedules for the next irrigation season and can be used by water managers for developing plans to manage the ground-water resources. PREDICTING PERFORMANCE OF PIPE CULVERTS BURIED IN SOIL,
Purdue Univ., Lafayette, Ind.
M. B. Roy.
Available from University Microfilms, Inc., Ann Arbor, Mich., 48106. Order No. 77-1768. PhD Thesis, 1976. 238 p.

Descriptors: *Analytical techniques, *Performance, *Piping, *Culverts, Soil physical properties, Model studies, Construction materials, Soil types, Computer models, Loads(Forces), Computer programs, Simulation analysis.

A simulation model based on the finite element method was developed to analyze the performance of culverts buried in soils. A computer program included curved bar segments with normal, tangential, and rotational degrees of freedom; triangular, isoparametric elements with a curved boundary to fit the pipe shape; three midside nodes which represented soil; and an 'interaction' element to simulate interface between pipe and soil. Nonlinear, anisotropic soil properties were included.

Construction sequences can be simulated and 'no-tension' analysis can be included. The system can be applied to questions of the influence of non-linear soil properties, relative stiffness of pipe and soil, the use of weak materials near the spring line, and construction procedures. Time-dependent soil properties, temporary soil compaction loads, and pipe cracking or yielding were not considered. Only two-dimensional problems transverse to the pipe can be analyzed. The analysis of circular corrugated metal pipe in granular soil showed that the maximum circumferential thrust in pipe depends, primarily, on the pipe diameter and height of the fill, and that it is necessary to determine the non-linear soil properties' effects on culvert performance. Neither construction sequence nor slip at soil-pipe interface were significant when the fill was loaded symmetrically. It was also found that Marston-Spangler soil modulus E' could not be used as a soil parameter for rational predictions of culvert performance. (Collins-FIRL)
W77-08622

THE EFFECT OF SURCHARGING ON DISCHARGE THROUGH A PIPE,
Hydraulics Research Station, Wallingford (England).
P. J. Colyer.
Chartered Municipal Engineer, Vol. 104, No. 4, p 60-62, April, 1977. 3 fig, 4 ref.

Descriptors: *Pipelines, *Flow, *Analytical techniques, Hydraulic models, Hydraulic structures, Performance, Evaluation, Hydraulic engineering, *Drainage, *Hydraulic design, *Storm drains.

A simple method was presented to determine the ratio of pipe discharge under surcharge and pipe-full discharge unaffected by surcharge. This information is useful for the design of drainage systems. Other applications include: determining whether an inadequate pipe should be replaced; assessing drainage system performance under rainfalls higher than design capacity; taking advantage of higher discharge capacities under surcharge in situations with difficult constructional constraints; calculating the effect on capacity of varying tailwater levels; and evaluating the comparative costs of designing for surcharged or non-surcharged conditions. The Darcy equation for flow in pipes was used as the basis of this analysis. The critical factor in increases or decreases of discharge through a surcharged pipe was the ratio of the hydraulic gradient to the pipe slope. (Collins-FIRL)

Journal of the Waterway, Port, Coastal and Ocean Division, American Society of Civil Engineers, Vol. 103, No. WW2, Proceedings Paper 12915, p 205-213, May 1977. 5 fig, 7 ref, 2 append.

Descriptors: *Coastal engineering, *Waves(Water), *Model studies, Numerical analysis, Ocean waves, Mathematical models, Wavelength, Hydraulics, Oceans, Velocity, Measurement, Profiles, Gravity waves.
Identifiers: *Velocity measurement, Particle orbits, Surface mass transport.

A numerical method was developed for calculating free-surface particle velocities in steady-state gravity waves of known profile. The method generates a unique solution for the orbit of a particle in the free surface, such that the motion of the particle is compatible with the observed wave profile, wavelength, and surface mass transport velocity and satisfies the dynamic free-surface boundary condition. Velocities of all free-surface particles may be derived from the geometry of the orbit. Velocities computed from the profile of a wave generated in the laboratory were shown to be compatible with simultaneous subsurface velocity measurements by the Laser Doppler Anemometer. The method was proved valuable in calculating impact velocities in wave slamming experiments. In view of the scatter apparent in almost all experimental evaluations of wave force coefficients, it was suggested that the method be applied to check the validity at the free surface of wave theories used in deriving coefficients from measured forces. PRESSURE REDUCING VALVES IN PIPE NETWORK ANALYSES,
Utah State Univ., Logan. Dept. of Civil and Environmental Engineering.
R. W. Jeppson, and A. L. Davis.
Journal of the Hydraulics Division, Proceedings of the American Society of Civil Engineers, Vol 102, No HY7, Proceedings paper No. 12252, p 987-1001, July 1976. 5 fig, 4 tab, 12 ref.

Descriptors: *Water distribution(Applied), *Pipes, *Networks, *Computers, *Valves, Hydraulics, Municipal water, Downstream, Equations, Pumping, Reservoirs, Steady flow.
Identifiers: *Pressure reduction, *Waterworks, Municipal engineering, Jacobian matrix, Banding algorithm, Water flow.

The three separate systems of equations that are in common use in solving steady flow problems in pipe networks are described and the method for including pressure reducing valves in each of these systems is given. The emphasis is on use of efficient computer oriented methods. In the method presented, the pressure reducing valves are permitted to operate normally in maintaining a constant downstream pressure, or they are permitted to act as check valves, preventing reverse flow should downstream pressures exceed valve settings. The inclusion of pressure reducing valves as an integral part of the network of pipes, pumps, reservoirs, and minor loss devices causes no appreciable reduction in the performance of computer programs that have been specifically written to carry out the computations for solutions. LOAD TRANSFER AND HYDRAULIC FRACTURING IN ZONED DAMS,
Cornell Univ., Ithaca, N. Y. School of Civil and Environmental Engineering.
F. H. Kulawy, and T. M. Gurtowski.
In: Journal of the Geotechnical Engineering Div sion, Proceedings of the American Society of Civ Engineers, Vol 102, No GT9, Proceedings pap 12400, p 963-974, September 1976. 6 fig, 5 tab, ref.

Descriptors: *Dams, *Embankment *Fractures(Geologic), Stability, Reservoirs, U stream, Analytical techniques, Hydraulics.
Identifiers: *Load transfer, *Zoned emban ments, *Fracturing, Mathematical applicatio Cracking, Poisson's ratio.

Incremental, nonlinear finite element analys were conducted for 14 representative zoned dar of differing geometries and material properties assess the load transfer and potential for cracki by hydraulic fracturing and local overstress. T results of these analyses showed that significa load transfer was observed in all cases; the lo transfer was from the core onto the transitions a shells over most of the height, but it was onto t core near the crest. Tis may be a possib mechanism for longitudinal core cracking in t crest. All other factors being equal, the dar which would exhibit the least transverse cracki potential would have flatter side slopes, would e hibit the least transverse cracking potential wou have have flatter side slopes, thicker cores, slo ing cores, medium dense shells and cores co pacted drier than optimum. The effect of var tions in the transitions properties and thicknesse dam height and core slope in sloping core dar was found to be small with regard to cracki potential. (Bell-Cornell)

MEANS AND METHOD FOR CONTROLLIN BEACH AND SANDBAR EROSION,
C. T. Ziegler.

U.S. Patent No. 4,000,619, 4 p, 8 fig, 3 ref; Official Gazette of the United States Patent Office, Vol 954, no 1, p 137, January 4, 1977.

Descriptors: *Patents, *Beaches, *Erosion, *Beach erosion, *Shore protection, Waves(Water), Engineering structures.

The invention provides a means and method wherein a series of porous bags are caused by wave action to fill with sand and collect on the bottom underlying the wave action with the result that the sand is immobilized and a region is established against which additional sand is collected to form a groin-like deposit. The porous bags are open at one end sufficiently to receive sand and are tied at close intervals to a feeder line, one end of which is anchored in the wave area and the other end of which extends to the shore area. The wave action is utilized to draw the bags progressively from the shore area into the wave area and effect a build-up of the deposited bags. By placement of a number of multiple bag and feeder line units, effective erosion control over a side area may be accomplished. (Sinha-OEIS)

NUMERICAL SOLUTION FOR FLOW UNDER SLUICE GATES,
Queensland Univ., Brisbane (Australia). Dept. of Civil Engineering.
L. T. Isaacs.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol. 103, No. HY5, Proceedings Paper 12923, p 473-481, May 1977. 4 fig, 1 tab, 14 ref, 3 append.

Descriptors: *Sluice gates, *Finite element analysis, *Analytical techniques, *Hydraulics, *Boundaries(Surfaces), Methodology, Flow, Radial gates, Numerical analysis, Gravity, Energy equation.
Identifiers: *Cubic curved triangular elements, Gauss-Seidel iteration.

A numerical method, based on finite element techniques, was developed for the analysis of gravity-affected flow under a sluice gate of arbitrary geometry. The analysis started with assumed free surface profile and two-dimensional discharge, which were modified systematically to give the final result. A curved cubic triangular element which gives a good representation of the boundary geometry and velocity field was employed. The results obtained for a vertical and a radial sluice gate compared favorably with results obtained by analytical methods. However, there are differences between experimental and theoretical (N numerical results, mostly attributed to the existence of a boundary layer. (Singh-ISWS)

MEAN BEHAVIOR OF BUOYANT JETS IN A CROSSFLOW
California Inst. of Tech. Pasadena.
G. J. Wright.
Journal of the Hydraulics Divisision, American Society of Civil Engineers, Vol 103, No HY5, Proceedings Paper 12944, p 499-513, May 1977. 10 fig, 2 tab, 11 ref, 1 append.

Descriptors: *Buoyancy, *Waste dilution, *Jets, *Dispersion, *Hydraulics, Flow, Dimensional analysis, Model studies, Froude number, Laboratory tests.
Identifiers: *Plumes, Trajectories, Buoyant jets, *Crossflow.

A model of round buoyant jets discharged normal to an ambient crossflow was presented. The time average behavior of the complex flow was derived by making analogies with simples flows whose behavior is better understood. The jet behavior was analyzed by considering it to be a source of kinematic momentum and buoyancy flux. The model considered four different flow regimes involving different trajectory and dilution relations. Assumptions for the entrainment of ambient fluid were not required. The predictions of the proposed model were compared to results presented by other researchers. Experiments were performed to verify the model for each flow regime. the experimental results were in agreement with the model predictions. (Singh-ISWS)

Journal of the Hydraulics Division, American Society of Civil Engineers, Vol. 103, No. HY5, Proceedings Paper 12948, p 557-567, May 1977. 16 fig, 13 ref, 1 append.

Descriptors: *Jets, *Turbulence, *Flow, Turbulent flow, Water pressure, Fluid mechanics, Shear stress, Velocity, Hydraulics, Equations, Mathematical studies.
Identifiers: *Jet flow, Impingement, Water speed, Round turbulent jet, Turbulent intensity, Water shear stress.

The characteristics of the velocity and pressure fields of a round turbulent jet impinging onto a plate were studied. Previous studies covered impingement heights that placed the plate in the fully developed flow region of the jet. The present study covered impingement heights between 0 and 20 nozzle radii. Axial and radial variations of velocity and static pressure were determined. Turbulence intensities along the center line within the impingement zone were presented. The energy balance of the mean flow was achieved pointwise along the jet axis within the impingement zone for two different impingement heights (Lee-ISWS)

DRAG AND INERTIA FORCES ON A CYLINDER IN PERIODIC FLOW,
Naval Postgraduate School, Monterey, Calif. Dept. of Mechanical Engineering.
C. J. Garrison, J. B. Field, and M. D. May.
Journal of the Waterway, Port, Coastal and Ocean Division, American Society of Civil Engineers, Vol. 103, No. WW2, Proceedings Paper No. 12913, p 193-204, May 1977. 6 fig, 6 ref, 2 append.

Descriptors: *Drag, *Hydrodynamics, *Reynolds number, *Laboratory tests, Hydraulic models, Piles(Foundations), Offshore Platforms, Analysis, Equations, Mathematical studies.
Identifiers: *Inertia, *Added mass coefficients, Forces, Amplitude, Displacement, Cylinder drag.

Experimental results for the drag and added mass coefficients for a smooth circular cylinder in oscillatory flow were presented. The test results were correlated with the Reynolds number with the ratio of the amplitude of the motion to cylinder diameter as a parameter. The low Reynolds number results of Keulegan and Carpenter were replotted in the same format, and together with the present high Reynolds number, results give a fairly complete picture of the variation of the drag and added mass coefficients with Reynolds number for fixed values of the relative amplitude parameter. The results showed that generally both the added mass and drag coefficients are highly dependent on the Reynolds number as well as the relative amplitude parameter. Above as Reynolds number of about 20,000, the two coefficients become essentially independent of the Reynolds number. (Adams-ISWS)

ADDED MASS OF PILE GROUP,
Delaware Univ., Newark, Dept. of Civil Engineering.
R. J. Gibson, and H. Wang.
Journal of the Waterway, Port, Coastal and Ocean Division, American Society of Civil Engineers, Vol. 103, No. WW2, Proceedings Paper 12932, p 215-223, May 1977. 10 fig, 3 ref, 2 append.

Descriptors: *Laboratory tests, *Hydrodynamics, *Piles(Foundations), Drag, Coastal structures, Hydraulic models, Structural design, Model studies, Equations, Mathematical studies.
Identifiers: *Pile groups, *Inertia, *Pile spacing, Forces, Wake interference, Blockage, Solidification.

Through laboratory investigation, its was shown that when a pile group is arranged in a cluster, the added mass (or inertial force) increases sharply after the spacing between piles falls below a certain critical value. Two configurations of pile group arrangement-circular and square shapes of approximately the same base diameter-were tested. The experimental results revealed that when the spacing between piles is smaller than two times the pile diameter, or when the solidification ratio becomes larger than 0.5, the added mass of the pile group increases drastically. For pile groups with individual pile spacing less than the critical value, the volume enclosed, rather than the volume displaced, by the pile cluster should be used as bases for added mass computation. EFFECT OF SEDIMENT LOAD ON STABLE SAND CANAL DIMENSIONS,
Roorkee Univ. (India), Dept. of Civil Engineering.
K. G. R. Raju, K. R. Dhandapani, and D. M. Kondap.
Journal of the Waterway, Port, Coastal and Ocean Division, American Society of Civil Engineers, Vol 103, No WW2, Proceedings Paper 12931, p 241-249, May 1977. 4 fig, 2 tab, 6 ref, 2 append.

Descriptors: *Bed load, *Canals, *Sediment load, Cross-sections, Dimensions, Sediments, Sedimentation rates, Stability, Hydraulics, Foreign countries, Foreign research.
Identifiers: *Sediment concentration, *India, Sediment deposits.

An experimental study was done with the object of providing a clear picture of the effect of sediment load on the dimensions of stable canals. The experiments were carried out in a recirculating sand tray at a constant discharge using sand of median size of 0.27 mm. Variation in sediment load was achieved by suitable changes in the initial cross section and slope given to the channel; the

equilibrium sediment concentration could thus be varied from 150 ppm to 2500 ppm by weight. It was found that the final stable cross sectional dimensions of the channel were practically insensitive to sediment concentration, whereas the final slope was strongly dependent on it. It was concluded that relations for cross-sectional dimensions of a stable canal may be evolved ignoring the effect of sediment concentration, but the regime slope ought to be related to the sediment concentration apart from the discharge and sediment size. Identifiers: Velocity profiles.

Methods were developed for calculation of mean velocity and pressure and mean turbulent kinetic energy, Reynolds tension, dissipation, etc., in turbulent incompressible flow after separation at a sudden increase in the cross section of a circular duct. One method, based on the concept of effective turbulent viscosity and elliptical equations (because of the recirculation taking place), allowed prediction of flow conditions from the point of separation to that a long way downstream at which normal flow is restored. Another method is associated more especially with the area in which normal flow is restored after readhesion; as the governing equations in this zone are parabolic, it was possible to apply models containing Reynolds stress transport equations without the turbulent viscosity concept. The overall calculated data were compared with experimental results determined on an aerodynamics model used to study the effect of the initial boundary layer, Reynolds number, and the cross-sectional expansion factor. Turbulent kinetic energy and friction transfer mechanisms were described in terms of the results of the comparison between theoretical and experimental data. (Humphreys-ISWS)

RESISTANCE OF TWO DIMENSIONAL TRIANGULAR ROUGHNESS,
Roorkee Univ. (India). Dept. of Civil Engineering.
N. Vittal, K. G. Ranga Raju, and R. J. Garde.
Journal of Hydraulic Research, Vol. 15, No. 1, p 19-36, 1977. 11 fig, 1 tab, 18 ref.

Descriptors: Hydraulics, *Flow resistance, *Shear, *Flumes, *Dunes, Boundaries(Surfaces), Laboratory tests, Calibrations, Data collections, Reynolds number, Dimensional analysis.
Identifiers: *Triangular roughness, *Form drag, Ripples and dunes, Undulating bed.

Measurements of shear and pressure distributions on smooth and sand coated two-dimensional triangular elements, simulating ripples and dunes, were made in a laboratory tilting flume. Relations were drived for the local and average skin shear coefficients in terms of the geometry of the elements and the Reynolds number of flow. The local pressure coefficient and the form drag coefficient were related to the roughness and the geometry of the elements. Analysis of the available data showed that the grain resistance of undulated beds calculated by the presently available methods was generally greater than the measured average grain resistance of the bed. An analysis of the available alluvial channel data indicated that the observed form drag agreed with the form drag of the two-dimensional triangular roughness. (Singh-ISWS)

A MATHEMATICAL MODEL OF STEADY FLOW IN CURVED SHALLOW CHANNELS,
Technische Hogeschool, Delft (Netherlands). Dept. of Civil Engineering.
H. J. De Vriend.
Journal of Hydraulic Research, Vol. 15, No. 1, p 37-54, 1977.

Descriptors: Hydraulics, *Model studies, *Laboratory tests, *Velocity, *Turbulence, Eddies, Analytical techniques, Interfaces, Mathematics, Shear, *Mathematical models.
Identifiers: *Eddy viscosity, *Curved flow, Perturbation method, Flow distribution.

Starting from a logarithmic main velocity profile, the vertical distribution of the secondary flow in a shallow curved channel was derived. the secondary circulation turned out to have one vertical and two horizontal components. The horizontal component in the main flow direction arises from the longitudinal acceleration of the main flow; the transverse horizontal component is due to the curvature of the main flow. A numerical method for the computation of the depth-averaged flow field and the bed shear stress was developed. The model allows flexibility in channel geometry. The vertical distributions of velocity computed from the model agree satisfactorily with the experimental results of other investigations if the flume or channel bed is not flat. (Singh-ISWS)

ROUGHNESS EFFECTS ON THE FLOW DIRECTION NEAR CURVED STREAM BEDS,
Karlsruhe Univ. (West Germany). Institut fuer Hydromechanik.
C. Zimmermann.
Journal of Hydraulic Research, Vol. 15, No. 1, p 73-85, 1977. 6 fig, 4 tab, 17 ref.

Descriptors: *Shear stress, *Channel flow, *Roughness(Hydraulics), Sediment transport, Roughness coefficient, Alluvial channels, Hydraulics, Equations, Mathematical studies.
Identifiers: *Curved stream beds, Radial shear stress, Channel beds, Bed roughness, Circular channels.

Radial shear stresses on the surface of curved channel beds due to secondary flow increase with increasing bed roughness and affect the direction of flow of sediment particle motion over a channel bed. By means of an analysis, it was shown that flow direction approaches the tangential direction of the flow with increasing bed roughness, while flow over smooth curved channel beds shows a stronger deviation from the tangential direction. Accordingly, fluid or sediment particles moving at a curved channel bed and originating from the outer wall region reach the inner wall much faster in a flow over a smooth bed than over a rough bed. The analytical result was confirmed by experiments in circular planform channels with fixed beds of varying roughness and also by alluvial bed experiments in circular channels. (Lee-ISWS)

Identifiers: *Drill string makeup, Chain tongs, Catheads, Power tongs, Torque.

Early methods of making and breaking drill pipe threaded joints were based on pure physical labor in keeping with the times. Tools used were originally known as early as 1500 a.d., such as the chain tong and the casing pole and rope, with the assistance of a sledge hammer for final tightening. With the general acceptance of the tool joint and the change to eight pitch round threads in the casing and tubing, initial turning to make up joints became a different proposition. In response, use of the cathead with various combinations of catline, forked line, wire line, and chain became the standard methods of spinning pipe. Further mechanization of the joining process was frequently resisted by drilling crew mechanization of the joining process was frequently resisted by drilling crew members afraid of losing their jobs, however, more sophisticated equipment has come into use nonetheless. Power tongs can now be built into rigs that will spin pipe rapidly and will apply sufficient torque without bending the pipe. The need still exists for further research toward faster and safer makeup equipment. (Eberle-NWWA)

TODAY'S WINDMILLS: A BLEND OF OLD AND NEW,
A. B. Stanley.
Water Well Journal, Vol 31, No 4, p 62-63, April, 1977.

Descriptors: *Energy, *Pumping, Winds, Technology, Water supply, Pumps, Turbines, Generators.
Identifiers: *Windmills, Windmill industry.

Far from being a relic of the past, the windmill industry is bigger today than ever and has never ceased to be essential for maintaining America's rural water supply. Windmill technology developed rapidly in the 1800's as deep wells became more feasible and machinery to pump them more necessary. In the peak year of 1929, more than 100 manufactureres of windmills reaped total sales of nearly 10 million dollars. Today the windmill can be used to directly drive a submersible pump. Dr. Bill Hughes of American Wind Turbine, Inc., has developed a system utilizing a 12-foot turbine, tower, generator, and pump which will draw from wells 350 feet deep using wind as

LIBRARY U. OF I. URBANA-CHAMPAIGN

the only power source. It is, admittedly, a relatively expensive way to pump water (8 or 9 cents/kolowatt hour) and the times when no wind is blowing still present a problem, but Hughes is confident that his device will become more competitive as energy prices soar, and that the American windmill will continue to thrive in years to come. GROUND WATER - SOLAR HEAT,
B. Cortell.
Water Well Journal, Vol 31, No 5, p 73, May, 1977.

Descriptors: *Solar radiation, *Energy, *Groundwater, Heating, Aquifers, Energy conversion.
Identifiers: *Heat storage(Energy).

Although solar heating has been with us for many years, the unavailability of energy on cloudy days is a disadvantage that still plagues us. Recent research has been done on the possibility of storing heat in undergound aquifers, a means by which the sun's discontinuous energy could be converted into a constant source. For example, if an artificial controlled well field with dimensions of 50 by 50 by 20 feet were installed in an ordinary building lot and the water temperature raised by 50 degrees F, 156 million BTU's of energy would be stored. Important questions concerning surrounding geological conditions still need to be asked, such as: (1) whether heating stored water will result in higher mineral content and pose a threat to solar collectors and well apparatus, and (2) whether heat transfer from the heat sink to the host formation will be a problem. (Eberle-NWWA)

A CASE FOR GEOTHERMAL ENERGY,
R. M. E. Diamant.
Heating and Ventilating Engineer, Vol 50, No 593, p 10-13, December, 1976. 1 fig, 9 ref.

Descriptors: *Thermal power, *Electric power production, *Electric power costs, Thermal power plants, Capital costs, Thermal water, Heating, *Geothermal studies.
Identifiers: *Great Britain, Crustal temperature gradients.

Although geothermal prospects in the United Kingdom are not obvious at first, such areas as Durham, Cornwall, and parts of the North sea show high thermal gradients of anywhere from 30 to 55 degrees C/km. Ways of exploiting these 'hot rock' areas may be devised in the future, while technology for utilizing thermal waters near the surface already exists to some extent. A recent report of the U.K. Department of Energy has estimated costs of both steam-flashing to drive generators and direct piping of hot water to homes and industry. Expenses involved in geothermal energy conversion are virtually all capital cost and very little operating cost. Overall, thermal power is not uneconomical and it will become more cost-effective if fossil fuel prices continue to rise at the present rate. Using a geothermal plant to provide a minimum base of energy and supplementing with coal or oil fired systems during periods of high demand may be a workable setup for certain areas. (Eberle-NWWA)

ECONOMICS OF GEOTHERMAL ENERGY DEVELOPMENT (IN IMPERIAL COUNTY, CALIFORNIA),
California Univ., Riverside. Graduate School or Administration.
S. Edmunds.
Energy, Vol 2, No 1, p 25-31, March, 1977. 7 tab, 16 ref.

Descriptors: *Thermal power plants, *Electric power production, *Electric power costs, *Comparative costs, Electric power rates, Capital costs, Construction costs, Manpower, *Geothermal studies, *California, Energy.
Identifiers: *Salton Trough(Calif), *Imperial County(Calif).

Geothermal resources in Imperial County (California) appear to have the potential of developing somewhere between 3000 and 6000 mW of power. By the year 2000, geothermal energy might supply about 4-5 percent of California's total generating capacity at that time. Steam flash technology presently available would appear to produce electricity from thermal sources at competitive costs of 38 mills per kWh or less, somewhat below comparative costs of coal, oil, or nuclear fueled systems. Estimates vary, but the combined field investment costs and generating plant investment are thought to be between 500 and 750 dollars per kWh of capacity for the completed installation, based on 1976 prices. Due to the capital-intensive nature of geothermal energy plant construction and operation and the necessity of shipping much of the equipment from outside the County, impact on the local job market will be relatively small. Local tax revenues, however, would amount to over 1 million dollars annually, and would be a major continuing benefit to Imperial County. (Eberle-NWWA)

N. G. Sapozhnikov.
Johnson Driller's Journal, Vol 49, No 2, p 8-9, March-April, 1977.

Descriptors: *Drilling, *Drilling equipment, *Well screens, *Well casings, Rotary drilling, Drilling fluids, Water supply.
Identifiers: *USSR, Well development, Cable-tool drilling.

In the Soviet Republics, water wells are widely used for the same purposes as in the United States. Although rotary and cable-tool drilling methods are fairly advanced, dug wells are still common for domestic rural water supply. Hydraulic rotary drilling accounts for about 80% of total new wells drilled for all purposes. High-grade bentonite muds are a standard fluid, however, Soviets frequently drill with clear water alone when penetrating fine sand aquifers. Drilling mud with special starch as a component is sometimes used to prevent clay plugging of water-bearing sands. Pipe-base mesh screens are the most common well filter; perforated pipe screens with conical openings are occasionally used for hydrogeological applications. Vibration together with driving is applied in some cases to increase rate and depth of sinking casing by cable-tool methods. Another means of speeding the driving process is to sink the casing through a guide pipe of slightly larger diamter. Mud is injected into the annulus between the casing string and the guide pipe as a lubricant. (Eberle-NWWA)

ROCK TYPE DECIDES JETTING ECONOMICS,
Koninklijke Shell Exploratie en Productie Laboratorium, Rijswijk (Netherlands).
A. C. Pols.
Oil and Gas Journal, Vol. 75, No. 6, p 71-75, February 7, 1977. 8 fig, 2 tab, 8 ref.

Descriptors: *Rotary drilling, *Rock properties, *Drilling equipment, Drilling fluids, Laboratory tests.
Identifiers: *Jet drilling, *Laminated rock, Isotropic impermeable rock, Drilling penetration rates.

Laminated rock was expected to show different behavior under jetting conditions than isotropic rock in the study under consideration. Tests showed an unsatisfactory performance for jetting a schist sample with water alone, including highly irregular hole walls. Hole shape improved with the use of a clay/water mud, however, penetration rate remained low. Economic comparison of jetting and conventional drilling techniques indicates that the former is not at all feasible at present for hard, impermeable laminated rock. Jetting is, however, cost-effective for permeable and impermeable isotropic sedimentary rock in cases where conventional drilling costs are high. Hybrid jetting/mechanical bits could possibly prove effective for drilling impermeable formations, but much more research on such tools is necessary. (Eberle-NWWA)

AIR, MIST AND FOAM DRILLING, A LOOK AT LATEST TECHNIQUES,
R. A. Hook, L. W. Cooper, and B. R. Payne.
World Oil, Vol. 184, No. 5, p 95-103, April, 1977. 6 fig, 3 ref.

Descriptors: *Rotary drilling, *Drilling equipment, Oil wells, Boreholes, Valves.
Identifiers: *Air-rotary drilling, Air-rotary bits, Mist drilling, Foam drilling, Air compressors.

Not only can air drilling techniques reduce drilling time and cut costs, they can also minimize formation damage, prolong bit life, and permit better drilling control in cavernous and lost circulation areas. Their primary disadvantages are poor performance in soft or wet formations. Actual rock removal occurs when the rock face fractures under the weight of the bit and particles are swept out of the hole in the air stream. The bits themselves are generally hard formation insert type roller-cone bits similar to those used in mud drilling. Conversion of a conventional rotary rig to an air drilling operation is relatively simple. Most of the liquid and solids handling equipment is removed, and a valve manifold, air compressor, and booster are added. A rotating drilling head is essential for containing and directing the flow of dust emerging from the hole. Blowout protectors, blooie lines, and other related equipment are added for air drilling for oil or natural gas. (Eberle-NWWA)

LIQUID JET EDUCTORS, THE 'PUMPS' WITH NO MOVING PARTS,
Schutte and Koerting Co., Cornwell Heights, Pa.
H. Stratton.
Plant Engineering, Vol. 123, No. 8, p 215-218, April 29, 1976. 8 fig.

Descriptors: *Pumping, *Hydraulic equipment, *Pumps, Flow, Deep wells, Slurries.
Identifiers: *Liquid jet eductors(Pumps).

Liquid jet eductors are unconventional pumps which operate according to the Bernoulli theorem, i.e., the kinetic energy of one fluid is used to move another fluid. Eductors have no moving parts to wear out, can be made of almost any machineable material, and can be installed in some sorts of remote locations inaccessable to commonly used pumping equipment. Various types of eductors have been designed for mixing or blending, pumping muds and slurries (or even solids), obtaining water from deep wells, and as priming devices for mechanical pumps. Theoretically, maximum performance of eductors can be precisely calculated, however, performance is affected by energy losses associated with mixing the two fluids and by friction losses in the diffuser. (Eberle-NWWA)

SELF-PRESSURIZING SEALS KEEP SUBMERSIBLE MOTORS DRY,
General Electric Co., Schenectady, N.Y.
J. D. McHugh.
Mechanical Engineering, Vol. 98, No. 2, p 20-27, February, 1976. 10 fig, 2 tab, 15 ref.

Descriptors: *Pumps, *Electric motors, *Water wells, *Sealants, Pumping, Electrical design.
Identifiers: *Submersible pumps, *Submersible electric motors, *Electric motor face seals, Pump failure.

For some sorts of water wells, especially deep wells, submersible pumps offer clear advantages. During the early years of pump development and use, however, a small but significant proportion of failures occurred in well installations apparently as a result of water in-pumping around face seals. Three possible causes of water invasion into pump motors were investigated by General Electric: vertical shock during installation, dynamic pressure variations during pumping causing reversed pressures across the seal, and in-pumping at the primary seal surfaces as explained by the theory of eccentric seal operation. Experiments pointed to the latter as the most probable source of trouble. Tests were subsequently run on a new self-pressuring double seal arrangement. The expected advantages of this design were greater protection against water ingress during both pumping and shut down, as well as reduction of wear on primary seal surfaces. Prototype motors showed such excellent performance in all these respects that motors incorporating this design have now been in production for about 4 years. (Eberle-NWWA)
W77-08672

SELECTION OF SLURRY PUMPS FOR SEVERE APPLICATIONS,
Warman International, Inc., Madison, Wis.
R. E. McElvain.
Mining Engineering, Vol. 28, p 26-28, December, 1976. 6 fig, 2 tab.

Descriptors: *Slurries, *Pumps, *Drilling fluids, *Pumping, Flow, Hydraulic design, Hydraulic machinery, Performance.
Identifiers: Pump selection.

As mining and other industries have placed increasing demands on equipment, slurry pumps have thus been developed which can handle greater solids concentrations, higher heads and pressures, and greater flow than pumps of ten years ago. Matching the right pump to its proper application can be done fairly precisely by considering flow-to-resistance relationships and head available against flow resistance. Adjustments usually need to be made in performance curves of slurry pumps to account for slip between fluid and particles as well as higher viscosity of slurry; most performance curves are established for clear water only. The greater the proportion of solids in the slurry mixture, the less the developed head during pumping and the lower the efficiency of the pump. Stable, shock-free flow at a safe carrying velocity is critical for a smoothly operating system and for pump protection. Maintaining slurry of sufficient density is one of the most important ways of keeping a pumping system economical. (Eberle-NWWA)
W77-08673

AVOIDING THE PERILS OF CAVITATION,
Buffalo Forge Co., N.Y.
L. B. Timmerman.
Machine Design, Vol 48, p 99-103, September 23, 1976. 8 fig.

Descriptors: *Pumping, *Damages, *Hydraulic equipment, Pumps, Pipe flow, Fluid friction, Vapor pressure.
Identifiers: *Cavitation, *Net positive suction head(NPSH), Friction losses.

Although the most visible damage from pump cavitation is impeller pitting, the worst damage is actually done to bearings and seals. The extreme, instantaneous, and irregular changes in radial and axial thrust that occur during cavitation cause rapid and uneven pump parts wear. Cavitation can be prevented if the net positive suction head available in a system is greater than the net positive suction head required by the pump. Available head is equal to the sum of atmospheric pressure and static head above the pump minus vapor pressure of the pumped liquid, friction loss from the suction pipe, velocity-head loss, and entrance loss at the pump. It is essential for the pumping system designer to bear in mind that atmospheric pressure fluctuates daily, which can result in occasional cavitation problems should too small a safety margin be allowed. The same holds true for friction loss; deposit build-up on pipe walls can increase friction loss to several times the original manufacturer's specifications as the system ages. (Eberle-NWWA)

SEISMIC DESIGN OF LIQUID-STORAGE TANKS,
Connecticut Univ., Storrs. Dept. of Civil Engineering.
H. I. Epstein.
Journal of the Structural Division, Proceedings of the American Society of Civil Engineers, Vol. 102, No. ST9, Proceedings paper No. 12380, p 1659-1673, September 1976. 7 fig, 2 tab, 22 ref.

Descriptors: *Seismic design, *Storage tanks, Water storage, *Earthquakes, Equations.
Identifiers: *Fluid dynamics, *Oil storage, *Tanks(Containers), Sloshing, Containers.

Cylindrical and rectangular flat-bottomed liquid storage tanks subjected to horizontal earthquake excitations are studied. Formulas and curves that can be used to obtain bending and overturning moments are presented. Certain combinations of earthquake response spectra and tank geometries produce maximum forces and moments when the tank is only partially full. The use of design curves in establishing this situation is illustrated. For slender tanks, an assumption made in present design practice is shown to lead to nonconservative results. The elimination of this assumption is shown to produce simplified expressions for the moments in these cases. Simplified expressions are also presented for use in estimating the maximum free surface displacement. (Bell-Cornell)

A. C. Pols.
Oil and Gas Journal, Vol. 75, No. 5, p 134-144, January 31, 1977. 11 fig, 2 tab.

Descriptors: *Rotary drilling, *Rock properties, *Drilling equipment, Drilling fluid, Laboratory tests.
Identifiers: *Jet drilling, *Isotropic impermeable rock, Drilling penetration rates.

Although jet drilling in hard, impermeable rock is much more difficult than in permeable rock, evidence indicates that impermeable isotropic rock can be jet-drilled at higher than conventional drilling rates, perhaps making jet drilling profitable for high daily rig cost ranges. In this study, laboratory test of an experimental jet bit were made on several rock samples placed under high axial load during which rotary speed, bit torque, fluid pressure before the swivel, ambient pressure, and depth of penetration were recorded as variables. Generally, penetration rate increased slowly with increasing bit-pressure drop (on the order of 10 millimeters/min. per megapascal), penetration rate

LIBRARY U. OF I. URBANA-CHAMPAIGN

decreased with increased mud density, and rotary speed had little effect on the isotropic impermeable samples. Significant departures from the norm, however, did occur for a few of the samples , and wide variations in borehole smoothness were evident between samples and with changes in mud density. CEMENT-MUD SPACER SYSTEM IMPROVES ILLINOIS WELLS,
Dow Chemical Co., Los Angeles, Calif. Dowell Div.
W. L. Crow, T. J. Griffin, and A. W. Putney.
Drilling-DCW, Vol. 38, No. 5, p 33-34, March, 1977. 2 fig.

Descriptors: *Drilling fluids, *Rotary drilling, *Cements, Well casings, Wells, *Illinois.
Identifiers: *Cement-mud spacers, Zone isolation.

The use of new water-base cement-mud spacer system between drilling mud and cement has proved effective in isolating production zones and obtaining better cement bonding. Designed to prevent intermixing of drilling fluid and cement during cementing operations, the spacer system helps eliminate channels or layers of drilling fluid occurring between the formation and cement, as well as reducing the chance of cement loss to naturally fractured or easily fractured formations. The spacer comes sacked and ready to mix in the field or cement bulk plant. A variety of materials can be used for weighting the spacer from 9.0 ppg up to 20 ppg as needed, or for combating lost circulation. Dramatic zone-isolation results have been obtained when the spacer was applied in more than 100 oil and gas wells in the lower Illinois basin. (Eberle-NWWA)
W77-08647

SPECIALTY CEMENTS CAN SOLVE SPECIAL PROBLEMS,
Western Co., Houston, Tex.
P. N. Parker.
Oil and Gas Journal, Vol. 75, No. 9, p 128-131, February 28, 1977. 4 tab.

Descriptors: *Cements, *Slurries, *Drilling, Pozzolans, Well casings, Cement grouting, Additives, Oil wells.
Identifiers: Thixotropic cements, Calcium aluminate cements.

Specialty cements are formulated by service companies and manufacturers for highly specific drilling needs. Pozzolan cements (blends of cement and fly ash) are of light to moderate density and can be modified for use at all depths. Easy to use and economical, pozzolan slurries are used for casing jobs, and sometimes for squeezes and lost-circulation plugs. Thixotropic cements are valuable for their gel-forming properties, and are employed primarily for cementing in lost-circulation zones. Special retarders and fluid-loss-control additives must be used instead of conventional additives with such cements in order to preserve thixotropic properties. Quick-setting cements can be used to seal off severe lost-circulation zones where other slurries would be absorbed, while expanding cements can be used to improve bonding to casing and formation during primary cementing. Calcium aluminate cement is useful in both cold-weather and geothermal conditions. Various light weight and petroleum-based cements have specific applications to the oil and gas industry. (Eberle-NWWA)
W77-08664

ADDITIVES TAILOR CEMENT TO INDIVIDUAL WELLS,
Western Co., Houston, Tex.
P. N. Parker, and C. Clement.
Oil and Gas Journal, Vol. 75, No. 11, p 54-58, March 14, 1977. 1 tab

Descriptors: *Cements, *Slurries, *Additives, Cement grouting, Drilling, Well casings, Bentonite, Calcium chloride, Sodium chloride, Sands.
Identifiers: Accelerators, Retarders, Density adjustment materials, Fluid loss additives, Lost-circulation additives.

The major classifications of the additives used to change the properties of well cements are: (1) accelerators (2) retarders (3) density adjusters (4) dispersants (5) fluid-loss additives (6) lost-circulation materials (7) auxiliary additives. Accelerators are used in situations where waiting-on-cement time must be minimized, calcium chloride being the most common additive for this purpose. Retarders perform the opposite function in cases where increased well temperature results in rapid setting. Density adjusters and dispersants modify slurry handling properties as required by the specific drilling situation. Fluid loss and auxiliary additives improve bonding and cement strength (and may help prevent formation damage), while lost-circulation materials cover vugs and fractures or seal permeable zones into which unmodified cement would tend to penetrate. (Eberle-NWWA)

POLYMERIZATION OF CONCRETE FIGHTS CAVITATION,
Restruction Corp., Denver, Colo.
M. A. Murray, and V. F. Schultheis.
Civil Engineering-American Society of Civil Engineers, Vol 47, No 4, p 67-70, April 1977. 9 fig.

Descriptors: *Dams, *Concrete, *Polymers, *Idaho, Cavitation, Erosion, Flumes, Hydraulic structures, Repairing, Waterproofing, Plastics, Dam construction, Concrete dams, Settling basins, Construction.
Identifiers: *Dworshak Dam(Idaho), Polymerization.

The techniques and materials used for the repair of concrete are many and varied. The repair at Dworshak Dam utilized epoxy resins, dry pack mortar, fibrous concrete, and a new technique, polymerization, for significantly increasing the strength of concrete at the surface. This paper identified the procedure utilized for the polymerization of vertical concrete surfaces in the outlet structure and horizontal concrete surfaces in the stilling basin. (Sims-ISWS)

FINE SCREENING OF RAW SEWAGE,
A. McVie.
The Public Health Engineer, Vol. 5, No. 2, p 38-42, March, 1977. 4 fig, 5 tab, 9 ref.

Descriptors: *Fine aggregates, *Screens, Analysis, *Testing, Filtration, Equipment, Sewage treatment, Water quality standards, Solid wastes, Sludge treatment, Design criteria, On-site testing, Hydraulics, Waste water treatment.
Identifiers: *Fine screening(Strainers).

Fine screens, or strainers, were defined as those having multiple individual openings less than 10 millimeters in either face dimension. Bar screens in any form are not covered by this definition. Tests were conducted when fine mesh rotating cup screens failed to meet their hydraulic specifications because of mesh blinding. It was possible to define the strainer's effective open area by using the fabric geometry and Boucher's Law to compute the effective hydraulic capacity. Water temperature played a significant role in the calculation. For each perforation size, there is a head which cannot be exceeded without incurring malfunction and felting. This depends upon the sewage filterability index and the breakthrough point. Because sewage is expected to have a fairly constant general range for the filterability index, and thus consistent straining characteristics, strainer rotation speed should be varied for extreme cases. It was impossible to test for the filterability index with sewage under laboratory conditions. The results of this investigation led to an increased screen capacity of 250% and the cessation of felting. The general approach used here may be applied all types of fabric including fixed bar screens. However, the Boucher hydraulic solution is limited to conditions of streamline or near streamline flow. RECENT ADVANCES IN ROTARY DRILL BITS,
Smith International, Inc., Irvine, Calif. Smith Tool Div.
L. L. Garner, and D. J. Millar.
World Oil, Vol. 184, No. 4, p 52-56, March, 1977. 12 fig.

Descriptors: *Rotary drilling, *Drilling equipment, Oil industry, Offshore platforms.
Identifiers: *Roller cone bits, Bits(Drilling), Bearings, Lubrication.

Increased drilling costs have created greater interest in the economics afforded by longer bit life and faster penetration rates. Advances in journal bearing technology and improved soft formation bits are helping achieve both objectives. Analysis of bearing failures has been the focus of bearing research in recent years. Greater sealing integrity is now possible in bits designed with a minimum number of sealing points, while cone and ball hole cracking are being controlled by better welding and heat treating techniques. Considerations such as bearing length versus hole wall clearance, bearing surface finish, supplemental lubrication, and bit weight and speed parameters are vital areas of future bearing research. Tungsten carbide insert technology has resulted in the evolution of new soft formation bit designed from the original 3-cone insert bit. Extended jet nozzles permit 25 to 50 percent faster penetration through soft formations in holes larger than 9 5/8 inches in diameter. The 2-cone bit, now being used experimentally, allows larger cutter and bearing diameters in proportion to length, as well as increased flexibility for positioning jet nozzles. In addition, improved roller cone core bits and re-entry bits are currently being developed for the oil and gas industries. (Eberle-NWWA)
W77-08649

DIAMOND COMPOSITES USED IN NEW BITS.
Oil and Gas Journal, Vol 75, No 16, p 71-72, April 18, 1977. 2 tab.

Descriptors: *Drilling equipment, Rotary drilling.
Identifiers: *Drill bits, *Polycrystalline diamond, General Electric Stratapax Blanks, Tungsten carbide materials.

Drill bits with inserts made of polycrystalline diamond layers bonded to tungsten carbide have had recently shown success in laboratory and field

tests. The polycrystalline product, manufactured by General Electric's Specialty Materials Department, chips off in minute discrete fragments during drilling, always leaving a fresh cutting edge forward. Lab test results suggest that slug-type bits made with the new material perform best at speeds above 150 rpm on a downhole motor at bit weights between 12,000 and 21,000 lbs. Although four experimental bits failed in field tests due to splashback erosion and consequent nozzle loss, cutting edges were not worn and penetration rates during drilling were much higher than for roller-cone bits in comparable situations. General Electric recommends the new bit for drilling soft to medium-hard formations. (Eberle-NWWA)

WATER TURBINE PUMP FAILURE,
Union Carbide Corp., Oak Ridge, Tenn. Nuclear Div.
C. R. Schmitt, and F. J. Lambert, Jr.
Materials Performance, Vol 14, No 2, p 29-30, February, 1975. 1 fig, 1 tab, 1 ref.

Descriptors: *Pumps, *Non-destructive tests, Pumping, *Testing, Testing procedures.
Identifiers: *Pump failure, *Deep-well turbine pumps, Gray cast iron, Pump discharge heads.

Recently, the 14 inch diameter cast iron elbow section of the discharge head of a 5500 gpm deep-well turbine pump ruptured at an Oak Ridge, Tennessee, pumping station. Since this was the second such incident in four years time, the matter was taken under study (a third, similar cast iron discharge head rupture occurred shortly after this study was completed). Various non-destructive tests were performed on fragments of the pump casing. Tensile strength results were well below the ASTM specification values for that grade of gray cast iron when newly manufactured. Internal casing cracks were discovered not only in the ruptured discharge head but also in the replacement pump housing sent by the manufacturer. It was recommended to the manufacturer that replacement pump discharge heads in the future because from modular ductile iron or fabricated out of steel plate rather than gray cast iron, in order to better withstand pump vibration and water-hammer stresses. (Eberle-NWWA)

PUMPING TESTS PROVIDE USEFUL DATA,
Universal Oil Products, St. Paul, Minn. Johnson Div.
T. L. Johnson.
Johnson Driller's Journal, Vol 49, No 2, p 4-7, March-April, 1977. 3 fig.

Descriptors: *Pumping, *Aquifer characteristics, *On-site tests, Water table, Electronic equipment, Drawdown, Specified yield, Transmissivity, Storage coefficient.
Identifiers: Orifice weirs, *Pumping test data.

Properly done, a pumping test can provide data by which are calculated the maximum yield of a well, its efficiency potential, interference between wells, and many other properties of wells and aquifers. Accurate measurement of drawdown and strict control of pumping rate are essential in obtaining such data. When testing with an orifice weir, it is good practice to employ a pump which can provide the desired pumping rate at 1/2 to 3/4 its maximum capacity. Similarly, the gate valve on the orifice meter should be between 1/2 to 3/4 open to provide enough back pressure for stable, accurate readings. Test equipment must be set up and checked well in advance of the actual test to ensure that the water level completely recovers. If neighboring wells cannot be shut off for the duration of the tests, they should at least be pumped at a constant rate. To establish the pumping rate for a long-term test, specific capacity of the well should be noted and a pumping rate which uses about 3/4 of the available drawdown should be calculated from that. (Eberle-NWWA)

PUMP CONSTRUCTION MATERIALS,
Vanton Pump and Equipment Co., Union, N.J.
E. Margus.
Plant Engineering, Vol 123, No 11, p 123-126, June 10, 1976. 4 fig.

Descriptors: *Pumps, *Materials engineering, Hydraulic design, Iron, Steel, Stainless steel, Copper, Copper alloys, Plastics.
Identifiers: Cast iron, Carbon steel, Alloy steel, Nickel, Thermoplastics, Nonferrous metals.

Because a pump's ability to function in a given environment necessitates certain strength and resistance properties peculiar to that situation, pump construction materials must be chosen with care. Both metals and nonmetals are commonly used. The ferrous metals employed in pump manufacture include cast iron (for housings), carbon steel, allow steel, stainless steel, and special alloys. Nonferrous metals include aluminum, copper, magnesium, nickel, titanium, and various precious and semi-precious metals. Plastics are gaining wider and wider popularity for pump parts. PVC is being used in impellers, casings, and covers. Polyamides (nylons) are used for a wide range of mechanical parts, while pump gaskets, seals and packing are often made of Teflon. Their high resistivities to corrosives make plastics increasingly attractive for harsh environments. (Eberle-NWWA)

Studies on Mercury Content in Selected Fish Species from Pomeranian Gulf and Szczecin Firth (Badania nad Zawartoscia Rteci Ogolnej W Wybranych Gatunkach Ryb Zatoki Pomorskiej I),
W77-08781 5C

Polychlorinated Biphenyls in Adult Mayflies (Hexagenia bilineata) from the Upper Mississippi River,
W77-08783 5C

Concentrations of PCBs, Dieldrin and DDT Residues in Marine Animals from Liverpool Bay,
W77-08788 5C

Algal Uptake of Copper from Compounds and Its Effect on Salt Metabolism in Algae,
W77-08792 5C

Production and Heavy Metal Concentration of Vascular Aquatic Macrophytes in Three Eastern Connectituct Rivers,
W77-08814 5B

ACCABONAC HARBOR (NY)
Effects of Mercury, Cadmium, and Lead Salts on Regeneration and Ecdysis in the Fiddler Crab, UCA Pugilator,
W77-08702 5C

ACCESS ROUTES
Recreational Water Resources Problems.
W77-08711 6B

ACCLIMATION
Laboratory Methods for Determining Temperature Preference,
W77-08770 5C

ACID-BASE EQUILIBRIUM
Method for Determining Acute Toxicity of an Acid Waste and Limiting Permissible Concentration at Boundaries of an Oceanic Mixing Zone,
W77-08771 5C

ACID MINE WATER
Acid Mine Drainage (AMD) and its Impact on a Small Virginia Stream,
W77-08784 5C

ACID WASTES
Method for Determining Acute Toxicity of an Acid Waste and Limiting Permissible Concentration at Boundaries of an Oceanic Mixing Zone,
W77-08771 5C

ACIDIC WATER
Method for Determining Acute Toxicity of an Acid Waste and Limiting Permissible Concentration at Boundaries of an Oceanic Mixing Zone,
W77-08771 5C

Atmospheric Sulfate Additions and Cation Leaching in a Douglas Fir Ecosystem,
W77-08822 2K

ACIDITY
Method for Determining Acute Toxicity of an Acid Waste and Limiting Permissible Concentration at Boundaries of an Oceanic Mixing Zone,
W77-08771 5C

ACROLEIN
Toxicity of Four Pesticides to Water Fleas and Fathead Minnows,
W77-08948 5C

ACTIVATED SLUDGE
High Speed Liquid Chromatographic Analysis of Cobalamin Productivity and Distribution in Activated Sewage Sludge Treatment,
W77-08621 5A

Nitrification and Heavy Metal Removal in the Activated Sludge Treatment Process,
W77-08623 5D

Controlling Sludge Bulking,
W77-08636 5D

Trickling Filter-Activated Sludge Combinations,
W77-08868 5D

Role of Nitrogen in Activated Sludge Process,
W77-08869 5D

Plant Size Influence on Performance in Activated Sludge Systems with Application to Regional Wastewater Treatment Planning,
W77-08928 5D

ADDED MASS COEFFICIENTS
Drag and Inertia Forces on a Cylinder in Periodic Flow,
W77-09017 8B

ADDITIVES
Additives Tailor Cement to Individual Wells,
W77-08665 8F

ADMINISTRATION
The Management of International Boundary Waters of Canada and the United States: A Comparative Study,
W77-08720 6E

ADMINISTRATIVE AGENCIES
Section 208 and Section 303 Water Quality Planning and Management: Where is it Now,
W77-08949 5G

Many Changes Urged for PL 92-500,
W77-08950 5G

Porter--Cologne Water Quality Control Act.
W77-08978 6E

Effluent Guidelines and Standards for Iron and Steel Manufacturing Point Source Category.
W77-08986 5G

Control of Pollution by Oil and Hazardous Substances, Discharge Removal.
W77-08987 5G

Mianus River Preservation Committee V. Administrator, Environmental Protection Agency (Jurisdiction of Federal Appeals Court for Permits Issued by State Agency Under NPDES).
W77-09001 6E

Homeowners Emergency Life Protection Committee V. Lynn (Enjoining of Major Federal Activity with Alleged Inadequate Environmental Impact Statement).
W77-09003 6E

Provo-Jordan River Parkway Authority.
W77-09009 6E

Policy Innovation and Institutional Fragmentation,
W77-09053 6E

Economic Development and Environmental Quality in the Northeastern Plateau Region of California,
W77-09055 6B

ADMINISTRATIVE DECISIONS
PL 92-500: New Federalism or Federal Takeover,
W77-08972 6E

Szeles--Natale, Inc. V Board of Commissioners of Swatara Township, Dauphin County (Flood Control Aided by Land Development Restraints),
W77-08992 6E

ADMINISTRATIVE REGULATIONS
Legal Battles on the California Coast: A Review of the Rules,
W77-08963 6E

Enforcement of Municipal Permits: Portent of Problems,
W77-08971 6E

Effluent Guidelines and Standards for Fertilizer Manufacturing Point Source Category, Urea and Ammonium Nitrate Subcategory.
W77-08984 5G

Interim Primary Drinking Water Regulations: Promulgation of Regulations on Radionuclides.
W77-08985 5G

Control of Pollution by Oil and Hazardous Substances, Discharge Removal.
W77-08987 5G

Permit Program Regulations For Concentrated Animal Feeding Operations.
W77-08988 5G

Szeles--Natale, Inc. V Board of Commissioners of Swatara Township, Dauphin County (Flood Control Aided by Land Development Restraints),
W77-08992 6E

Mc Cormick V Lawrence (Constitutionality of New York Statute Aimed at Promoting Governmental Interest in Preserving Appearance of an Area).
W77-09004 6E

ADSORPTION
Adsorption and Vertical Movement of the Zinc and Manganese Ions in Three Types of Soil,
W77-09054 5B

AERATION
Waste Water Aeration System Produces Small Bubbles.
W77-08630 5D

Auxiliary Air System for Use in Laboratory Experiments,
W77-08800 7B

Effects of Hypolimnetic Aeration on Nitrogen and Phosphorus in a Eutrophic Lake,
W77-08824 5C

Analytical Models for the Evaluation of Supplemental Aeration in Texas Estuaries,
W77-08917 5B

AEROBIC DIGESTION
Rational Design of Aerobic Digestion Systems,
W77-08643 5D

AEROBIC TREATMENT
Composting Destroys Pathogens in Sewage Solids,
W77-08641 5E

Rational Design of Aerobic Digestion Systems,
W77-08643 5D

AESTHETICS
Mc Cormick V Lawrence (Constitutionality of New York Statute Aimed at Promoting Governmental Interest in Preserving Appearance of an Area).
W77-09004 6E

AGRICULTURAL RUNOFF
Movement of Manurial Nitrogen in Cool, Humid Climates,
W77-08819 5B

Computer Modeling for the Prediction of Water Quality from Agricultural Drainage,
W77-08934 5B

Qualitative and Quantitative Changes in the Benthic Fauna of a Trout Stream, the Couze Pavin Puy-De-Dome, Caused by Agricultural and Urban Pollution, (In French),
W77-08955 5C

AGRICULTURAL WATERSHEDS
Computer Modeling for the Prediction of Water Quality from Agricultural Drainage,
W77-08934 5B

AGRICULTURE
Effect of Agricultural and Silvicultural Practices on the Runoff from Drainage Basins of the Nizhnedevitskaya Hydrologic Station,
W77-08835 4C

AIR-ROTARY DRILLING
Air, Mist and Foam Drilling, A Look at Latest Techniques,
W77-08669 8C

ALASKA
Environmental Planning for an Alaskan Water-Oriented Recreation Area,
W77-08805 6B

Limnological Investigation of Six Lakes in Southeast Alaska,
W77-09069 7C

ALBUQUERQUE ARROYOS (NM)
Flood Plain Information: Albuquerque Arroyas, Part V, Albuquerque, New Mexico.
W77-08611 4A

ALGAE
Biologically Active Metabolites of Blue-Green Algae and Their Effect on Experimental Animals, (In Russian),
W77-08749 5C

A Certain Marine Catenate Dinoflagellate Tentatively Applied for Detecting Carcinogens,
W77-08795 5A

Environmental Planning for an Alaskan Water-Oriented Recreation Area,
W77-08805 6B

Environmental Regulation of Gametogenesis in Scenedesmus Obliquus,
W77-09060 5C

Willimantic River Organisms Grown in Media with Natural Substrate Levels as Inocula for Algal Assays,
W77-09091 5C

The Effect of Secondarily Treated Sewage on the Algal Populations of the Willimantic/Shetucket Rivers,
W77-09096 5C

ALGAE EXTRACELLULAR PRODUCTS
Behavioral Studies on Chemoreception in Balanus hameri,
W77-08799 5C

ALGAL CONTROL
Hydrologic Considerations in Dewatering and Refilling Lake Carlton, Orange and Lake Counties, Florida,
W77-09080 5G

ALGAL COPPER UPTAKE
Algal Uptake of Copper from Compounds and Its Effect on Salt Metabolism in Algae,
W77-08792 5C

ALGAL GROWTH
Willimantic River Organisms Grown in Media with Natural Substrate Levels as Inocula for Algal Assays,
W77-09091 5C

ALGAL POISONING
Biologically Active Metabolites of Blue-Green Algae and Their Effect on Experimental Animals, (In Russian),
W77-08749 5C

ALGAL PRODUCTION
Environmental Planning for an Alaskan Water-Oriented Recreation Area,
W77-08805 6B

ALGICIDES
Algal Uptake of Copper from Compounds and Its Effect on Salt Metabolism in Algae,
W77-08792 5C

A Certain Marine Catenate Dinoflagellate Tentatively Applied for Detecting Carcinogens,
W77-08795 5A

ALGORITHMS
Improved Methodology for Design and Operation of Water Distribution Systems, (Parts I-III),
W77-08940 4A

Nonlinear Estimation in Stream Quality Modeling,
W77-09047 5B

ALKALINITY
Method for Determining Acute Toxicity of an Acid Waste and Limiting Permissible Concentration at Boundaries of an Oceanic Mixing Zone,
W77-08771 5C

ALPINE GLACIERS
Study of an Ice Core to the Bedrock in the Accumulation Zone of an Alpine Glacier,
W77-08846 2C

ALTERNATE PLANNING
Economic Development and Environmental Quality in the Northeastern Plateau Region of California,
W77-09055 6B

ALTERNATE WATER USE
Economic Development and Environmental Quality in the Northeastern Plateau Region of California,
W77-09055 6B

ALTERNATIVE COSTS
Say Goodbye to Ocean Dumping,
W77-08969 5C

ALTERNATIVE PLANNING
Chippewa Flowage Investigations. Part 1: Summary Report,
W77-08725 6B

ALTERNATIVE WATER USE
An Energy Accounting Evaluation of Several Alternatives for Hydropower and Geothermal Development,
W77-09057 6B

ALUMS
Dewatering Chemical-Primary Sludges,
W77-08865 5D

AMERICAN RIVER PARKWAY (SACRAMENTO CALIFORNIA)
Analysis of Supply and Demand of Urban Oriented Nonreservoir Recreation.
W77-08871 6B

AMMONIA
Phytoplankton Standing Crop and Sewage Nutrient Enrichment Along the Central Coast of Lebanon,
W77-08762 5C

Movement of Manurial Nitrogen in Cool, Humid Climates,
W77-08819 5B

Kinetic Response of Perturbed Marine Nitrification Systems,
W77-08946 5C

AMMONIUM CHLORIDE
Kinetic Response of Perturbed Marine Nitrification Systems,
W77-08946 5C

AMMONIUM COMPOUNDS
Effluent Guidelines and Standards for Fertilizer Manufacturing Point Source Category, Urea and Ammonium Nitrate Subcategory.
W77-08984 5G

AMMONIUM SALTS
Kinetic Response of Perturbed Marine Nitrification Systems,
W77-08946 5C

ANABAENA
Biologically Active Metabolites of Blue-Green Algae and Their Effect on Experimental Animals, (In Russian),
W77-08749 5C

ANABAENA CIRCINALIS
Physical and Chemical Parameters Associated with Phytoplankton Abundance and Periodicity in a Fertilized Fish Pond,
W77-08922 5C

ANAEROBIC CONDITIONS
Mineral Distribution Within the Sediments of Pearl Harbor,
W77-08815 2L

ANALOG MODELS
Analog Simulation of the Ground-Water System, Yuma, Arizona,
W77-09067 2F

ANALYTICAL TECHNIQUES
Predicting Performance of Pipe Culverts Buried in Soil,
W77-08622 8B

The Effect of Surcharging on Discharge Through a Pipe,
W77-08644 8B

The Residual Oxygen Bioassay: A Rapid Procedure to Predict Effluent Toxicity to Rainbow Trout,
W77-08766 5A

A Comparison of Methods of Hydrocarbon Analysis of Marine Biota,
W77-08789 5A

Finite Element Solution of the Two-Dimensional Unsaturated Flow Equation,
W77-08923 2G

Numerical Solution for Flow Under Sluice Gates,
W77-09012 8B

ANHOLT ISLAND (DENMARK)
Ground Water Model for the Island of Anholt, Denmark,
W77-09030 2F

ANIMAL BEHAVIOUR
Some Effects of Oil Dispersants on the Feeding Behaviour of the Brown Shrimp, Crangon crangon,
W77-08790 5C

Behavioral Studies on Chemoreception in Balanus hameri,
W77-08799 5C

ANION EXCHANGE
The Use of Ion Exchange Methods to Determine Trace Elements in Natural Waters: IV. Uranium, Cobalt and Cadmium, (In German),
W77-08787 5A

ANNUAL FLOOD
Economics of Permanent Flood-Plain Evacuation,
W77-08856 6B

ANTARCTIC
Was There a Late-Wurm Arctic Ice Sheet,
W77-08839 2C

ANTHROPOGENIC PROCESSES
Present-Day Slumping and Erosion Phenomena on Irrigated Lands (Exemplified by Southeastern Ciscaucasia), (In Russian),
W77-08885 2J

APPROPRIATION
Unlawful Use, Diversion or Waste of State Water.
W77-08995 6E

AQUATIC ALGAE
Fate and Biological Effects of Mercury Introduced into Artificial Streams,
W77-08757 5C

AQUATIC BACTERIA
Results of a Microbiological Investigation of the Danube River by One Point Profile (1969-1971), (In German),
W77-08694 5B

AQUATIC ENVIRONMENT
Estimation and Evaluation of Radioactive Contamination Through a Food Web in an Aquatic Ecosystem: I. An Application of the Compartment Model to Transfer of Radioactive Substances Through a Food Chain,
W77-08695 5C

AQUATIC FUNGI
Effects of Primary Sewage Effluent from the City of Willimantic on the Benthic Invertebrate Fauna of the Willimantic/Shetucket Rivers,
W77-09093 5C

AQUATIC INSECTS
Minimum Oxygen Levels Survived by Stream Invertebrates,
W77-08926 5C

AQUATIC MICROBIOLOGY
Fate and Biological Effects of Mercury Introduced into Artificial Streams,
W77-08757 5C

AQUATIC MICROORGANISMS
Results of a Microbiological Investigation of the Danube River by One Point Profile (1969-1971), (In German),
W77-08694 5B

The Effect of the Willimantic Sewage Treatment Plant on the Microflora and Metabolism of the Shetucket River,
W77-09094 5C

AQUATIC NITROGEN
Real-Time Measurements of Aquatic Nitrogen,
W77-09095 5D

AQUATIC PLANTS
Effects of Dipotassium Endothall on Rooted Aquatics and Adult and First Generation Bluegills,
W77-08785 5C

Production and Heavy Metal Concentration of Vascular Aquatic Macrophytes in Three Eastern Connectituct Rivers,
W77-08814 5B

AQUATIC WEED CONTROL
Effects of Dipotassium Endothall on Rooted Aquatics and Adult and First Generation Bluegills,
W77-08785 5C

AQUEOUS SOLUTIONS
Reactions in the Aqueous Environment of Low Molecular Weight Organic Molecules,
W77-08754 5B

Retention and Flow Characteristics of Polymer Solutions in Porous Media,
W77-08850 2G

AQUICULTURE
Parasites and Diseases of Cultured Catfish for the Period July 1, 1972 Through June 20, 1975,
W77-08756 5C

Optimal Temperature for Growth of Juvenile Bluegills,
W77-08798 5C

Auxiliary Air System for Use in Laboratory Experiments,
W77-08800 7B

AQUIERS
Simulations of Water-Level Drawdowns in Proposed Well-Field Areas, Dade County, Florida,
W77-08739 4B

AQUIFER CHARACTERISTICS
Pumping Tests Provide Useful Data,
W77-08658 8G

Availability of Ground Water in the Middle Merrimack River Basin, Central and Southern New Hampshire,
W77-08733 7C

Outline of the Water Resources of the Satus Creek Basin, Yakima Indian Reservation, Washington,
W77-08740 4B

Hydrologic Reconnaissance of the Geothermal Area Near Klamath Falls, Oregon, with a Section on Preliminary Interpretation of Geophysical Data,
W77-09070 4B

Report on Preliminary Data for Madison Limestone Test Well No. 1, NE1/4SE1/4 Sec. 15, T. 57 N., R. 65 W., Crook County, Wyoming,
W77-09072 4B

Ground-Water Resources and Geology of Walworth County, Wisconsin,
W77-09081 2F

AQUIFERS
Simulation of Pollutant Movement in Groundwater Aquifers,
W77-08807 5B

Surface-Groundwater Interactions and the Conjunctive Use of the Water Resources of the Mullica River Basin, New Jersey,
W77-08810 4B

Soil and Rock Strata to Trap, Filter and Store Water for Rural Domestic use,
W77-08821 3B

A 'Rough Cut' Model of a South Florida Water Supply Plan,
W77-08980 4B

Transient Analysis of Phreatic Aquifers Lying Between Two Open Channels,
W77-09026 2F

Artificial Recharge to a Freshwater-Sensitive Brackish-Water Sand Aquifer, Norfolk, Virginia,
W77-09066 4B

Water-Level Records for the San Luis Valley of Colorado, 1973-77,
W77-09088 7C

ARCTIC
Some Hydrochemical Characteristics of the Mouth Reaches of the Anabar, Lena, Yana, and Indigirka Rivers,
W77-08833 2L

Was There a Late-Wurm Arctic Ice Sheet,
W77-08839 2C

ARGON
N2 : Ar, Nitrification and Denitrification in Southern California Borderland Basin Sediments,
W77-08907 5A

ARIZONA
Annual Summary of Ground-Water Conditions in Arizona, Spring 1975 to Spring 1976,
W77-08732 7C

An Assessment of Snowpack Depletion-Surface Runoff Relationships on Forested Watersheds,
W77-08933 3B

Analog Simulation of the Ground-Water System, Yuma, Arizona,
W77-09067 2F

ARKANSAS RIVER (KS)
Special Flood Hazard Information: Arkansas River, Fort Dodge - Wilroads Gardens, Vicinity of Dodge City, Kansas.
W77-08612 4A

AROCLOR
Polychlorinated Biphenyls in Adult Mayflies (Hexagenia bilineata) from the Upper Mississippi River,
W77-08783 5C

AROMATIC COMPOUNDS
The Microbial Degradation of Aromatic Petroleum Products,
W77-08759 5B

ARROYOS
Flood Plain Information: Albuquerque Arroyas, Part V, Albuquerque, New Mexico.
W77-08611 4A

ARSENIC
Study on the Post-Mortem Identification of Pollutants in the Fish Killed by Water Pollution: Detection of Arsenic,
W77-08775 5A

ARSENIC COMPOUNDS
A Study of Heavy Metals in Lake Abbaya, Ethiopia, and the Incidence of Non-Parasitic Elephantiasis,
W77-08774 5A

ARSENICALS (PESTICIDES)
Study on the Post-Mortem Identification of Pollutants in the Fish Killed by Water Pollution: Detection of Arsenic,
W77-08775 5A

ARTESIAN WELLS
Molybdenum Content in the Subsurface Waters of the Vinnitsa Oblast, (In Russian),
W77-08882 2K

ARTIFICIAL RECHARGE
Artificial Recharge for Subsidence Abatement at the NASA-Johnson Space Center, Phase I,
W77-08744 4B

Soil and Rock Strata to Trap, Filter and Store Water for Rural Domestic use,
W77-08821 3B

Artificial Recharge to a Freshwater-Sensitive Brackish-Water Sand Aquifer, Norfolk, Virginia,
W77-09066 4B

ARTIFICIAL STREAMS
Fate and Biological Effects of Mercury Introduced into Artificial Streams,
W77-08757 5C

ASHEPOO ESTUARY (SC)
A Reconnaissance of the Hydrology of the Edisto and Ashepoo Estuaries, South Carolina,
W77-09076 2L

ASHUELOT RIVER (NH)
Flood Plain Information: Ashuelot River, City of Keene, New Hampshire.
W77-08615 4A

ASPHALT
Development of a Low Cost Asphalt-Rubber Membrane for Water Harvesting Catchments and Reservoir Seepage Control,
W77-08601 3B

ASPHALT RUBBER MEMBRANES
Development of a Low Cost Asphalt-Rubber Membrane for Water Harvesting Catchments and Reservoir Seepage Control,
W77-08601 3B

ATLANTIC OCEAN
Hydrothermal Processes in the Atlantic Ocean Crust, 26 Degrees N,
W77-08681 2K

Preliminary Summary of the 1976 Atlantic Margin Coring Project of the U.S. Geological Survey,
W77-09089 2L

ATRAZIN
Effects of Sublethal Concentrations of the Herbicide Atrazin on Growth and Reproduction of Daphnia Pulex,
W77-08786 5C

ATTACHED ALGAE
The Effect of Secondarily Treated Sewage on the Algal Populations of the Willimantic/Shetucket Rivers,
W77-09096 5C

ATTITUDES
Citizen Participation in Water Policy Formation,
W77-08603 6B

The Structural Analysis of Environmental Perception and Cognition: A Multidimensional Scaling Approach,
W77-08722 6B

Longitudinal Analysis of Change in Levels of Affiliation and Participation in Voluntary Formal Organizations,
W77-09058 6B

AUSTRALIA
Eutrophication of an Impounded Estuarine Lagoon,
W77-08778 5C

Natural Stream Temperature Variations in a Catchment,
W77-09039 5B

AUSTRIA
Results of a Microbiological Investigation of the Danube River by One Point Profile (1969-1971), (In German),
W77-08694 5B

AUTOMATION
Philadelphia's Water System Automation Plan,
W77-08864 5

AUXILIARY AIR SYSTEM
Auxiliary Air System for Use in Laborator Experiments,
W77-08800 7

AVAILABLE WATER
Outline of the Water Resources of the Satu Creek Basin, Yakima Indian Reservation Washington,
W77-08740 4

AVOIDANCE
Application of Temperature Preference Studie to Environmental Impact Assessment,
W77-08768 5

Avoidance of Bleached Kraft Pulpmill Effluen by Pinfish (Lagodon Rhomboides) and Gul Killifish (Fundulus Grandis),
W77-08780 5

AVOIDANCE RESPONSE
Avoidance of Bleached Kraft Pulpmill Effluen by Pinfish (Lagodon Rhomboides) and Gul Killifish (Fundulus Grandis),
W77-08780 5

BACKWATER
Principles of Graphical Gradually Varied Flow Model,
W77-09015 2

Computer Applications for Step-Backwater and Floodway Analyses,
W77-09090 4A

BACKWATER MODELS
Principles of Graphical Gradually Varied Flow Model,
W77-09015 2

BACTERIA
Parasites and Diseases of Cultured Catfish fo the Period July 1, 1972 Through June 20, 1975,
W77-08756 5C

BACTERIA SURVIVAL RATE
Survival of Bacteria in Turbid and Polluted Waters,
W77-08606 5C

BALTIMORE CANYON
Wave Refraction Diagrams for the Baltimore Canyon Region of the Mid-Atlantic Continental Shelf Computed by Using Three Bottom Topography Approximation Techniques,
W77-08912 2L

BALTIMORE HARBOR (MD)
Trace Element Inventory for the Northern Chesapeake Bay with Emphasis on the Influence of Man,
W77-08704 5C

BARCELONETA (PUERTO RICO)
Comprehensive Oceanographic Baseline Study at Barceloneta, Puerto Rico.
W77-08853 5B

BARGES
Sinkage and Resistance for Ships in Channels,
W77-08873 8B

BARNACLES
Methylmercury Induced Injury of Single Barnacle Muscle Fibers,
W77-08700 5C

LIBRARY U. OF I. URBANA-CHAMPAIGN

Behavioral Studies on Chemoreception in Balanus hameri,
W77-08799 5C

BARRIERS
Barrier for Water Carried Pollutants,
W77-08878 5G

Skimmer Fence,
W77-08893 5G

BASAL SLIDING
An Experimental Study of the Motion of Ice Past Obstacles by the Process of Regelation,
W77-09033 2C

BASE FLOW
Ground Water Budget of the Mountainous Regions of Hungary, (In Hungarian),
W77-08663 2F

BASELINE STUDIES
Comprehensive Oceanographic Baseline Study at Barceloneta, Puerto Rico.
W77-08853 5B

A Conceptual Representation of the New York Bight Ecosystem,
W77-08900 5B

N2 : Ar, Nitrification and Denitrification in Southern California Borderland Basin Sediments,
W77-08907 5A

Cooperative Gulf of Mexico Estuarine Inventory and Study--Texas: Area Description,
W77-08916 2L

An Examination of Some Physical and Biological Impacts of Dredging in Estuaries,
W77-08918 5C

Ocean Dumping in the United States - 1975, Third Annual Report of the Environmental Protection Agency on the Administration of Title I of the Marine Protection, Research, and Sanctuaries Act of 1972, as Amended.
W77-08919 5B

BASIC DATA COLLECTIONS
Chippewa Flowage Investigations. Part 3A: Appendixes.
W77-08726 6B

Chippewa Flowage Investigations. Part 3B: Appendixes.
W77-08727 6B

BAYESIAN STATISTICS
Practical use of Decision Theory to Assess Uncertainties about Actions Affecting the Environment,
W77-08927 6G

BAYS
Biscayne Bay Symposium II,
W77-08961 5G

BEACH EROSION
Means and Method for Controlling Beach and Sandbar Erosion,
W77-08894 8B

BEACHES
Grain-Size Parameters of Insoluble Residues in Mixxed Terrigenous-Skeletal Carbonate Sediments and Sedimentary Rocks: Some New Zealand Examples,
W77-08848 2L

Means and Method for Controlling Beach and Sandbar Erosion,
W77-08894 8B

A Rational National Policy on Public Use of the Beaches,
W77-08976 6E

Beach Sand Transport: Distribution and Total Drift,
W77-09019 2L

BED LOAD
Effect of Sediment Load on Stable Sand Canal Dimensions,
W77-09020 8B

BEHAVIOR
The Structural Analysis of Environmental Perception and Cognition: A Multidimensional Scaling Approach,
W77-08722 6B

BEHAVIORAL RESPONSES
Physiological and Behavioral Reactions of Fishes to Temperature Change,
W77-08802 5C

BEHAVIORAL TOXICOLOGY
The Development of a Test for the Potability of Water Treated by a Direct Reuse System,
W77-08758 5A

BENDING
Research Benefits in Water Resources Construction,
W77-08858 6B

BENEFITS
Research Benefits in Water Resources Construction,
W77-08858 6B

Incidence of the Benefits and Costs of Environmental Programs,
W77-08870 6G

Analysis of Supply and Demand of Urban Oriented Nonreservoir Recreation.
W77-08871 6B

BENTHIC FAUNA
Acid Mine Drainage (AMD) and its Impact on a Small Virginia Stream,
W77-08784 5C

Concentrations of PCBs, Dieldrin and DDT Residues in Marine Animals from Liverpool Bay,
W77-08788 5C

New Sampler for Shallow-Water Benthic Macroinvertebrates,
W77-08801 7B

Minimum Oxygen Levels Survived by Stream Invertebrates,
W77-08926 5C

Qualitative and Quantitative Changes in the Benthic Fauna of a Trout Stream, the Couze Pavin Puy-De-Dome, Caused by Agricultural and Urban Pollution, (In French),
W77-08955 5C

Effects of Primary Sewage Effluent from the City of Willimantic on the Benthic Invertebrate Fauna of the Willimantic/Shetucket Rivers,
W77-09093 5C

BENTHIC INSECT COMMUNITIES
Fate and Biological Effects of Mercury Introduced into Artificial Streams,
W77-08757 5C

BENTHIC MACROINVERTEBRATES
New Sampler for Shallow-Water Benthic Macroinvertebrates,
W77-08801 7B

BENTHOS
Density and Distribution of Benthos in Lake Keowee, South Carolina,
W77-08818 5C

Comprehensive Oceanographic Baseline Study at Barceloneta, Puerto Rico.
W77-08853 5B

United States V 62.61 Acres of Land, More or Less, In City of Virginia Beach, Commonwealth of Virginia (A Compensable Property Right as Might Exist in a Wharf or Pier will not be Found in a Jetty Constructed in Navigable Waters),
W77-08990 6E

Almeda County Water District V Niles Sand and Gravel Company, Inc. (Use of Correlative Rights Doctrine to Defeat Claim of Inverse Condemnation),
W77-08991 6E

CONFERENCES
Thermal and Chemical Problems of Thermal Waters, Symposium.
W77-08677 2K

Proceedings: The Connecticut River System: A Workshop on Research Needs and Priorities.
W77-08808 6B

Lake-Shoreland Management Programs: Selected Papers,
W77-08924 2H

CONGRESSIONAL HEARINGS
To Extend the Marine Protection, Research, and Sanctuaries Act (Hearing on S 3147 to Extend the Act 2 Years).
W77-08981 6E

Amend the Merchant Marine Act of 1920 (Hearings on S 2422 to Include the Virgin Islands Within the Scope of the Act With Respect to Transportation of Oil and Oil Products).
W77-08982 6E

CONJUNCTIVE USE
Surface-Groundwater Interactions and the Conjunctive Use of the Water Resources of the Mullica River Basin, New Jersey,
W77-08810 4B

CONNECTICUT
Production and Heavy Metal Concentration of Vascular Aquatic Macrophytes in Three Eastern Connectituct Rivers,
W77-08814 5B

Mianus River Preservation Committee V. Administrator, Environmental Protection Agency (Jurisdiction of Federal Appeals Court for Permits Issued by State Agency Under NPDES).
W77-09001 6E

Rykar V Gill (State's Refusal to Allow Upland Owner to Fill Adjacent Marshland Because of Owner's Access to Deep Water by Use of Wharfing Techniques),
W77-09005 6E

Man's Effect on the Fishes of the Upper Shetucket River System,
W77-09061 5C

Willimantic River Organisms Grown in Media with Natural Substrate Levels as Inocula for Algal Assays,
W77-09091 5C

Effects of Primary Sewage Effluent from the City of Willimantic on the Benthic Invertebrate Fauna of the Willimantic/Shetucket Rivers,
W77-09093 5C

The Effect of the Willimantic Sewage Treatment Plant on the Microflora and Metabolism of the Shetucket River,
W77-09094 5C

The Effect of Secondarily Treated Sewage on the Algal Populations of the Willimantic/Shetucket Rivers,
W77-09096 5C

CONNECTICUT RIVER
Proceedings: The Connecticut River System: A Workshop on Research Needs and Priorities.
W77-08808 6B

CONSTANT TEMPERATURE TEST
Optimal Temperature for Growth of Juvenile Bluegills,
W77-08798 5C

CONSTITUTIONAL LAW
Rykar V Gill (State's Refusal to Allow Upland Owner to Fill Adjacent Marshland Because of Owner's Access to Deep Water by Use of Wharfing Techniques),
W77-09005 6E

CONTIGUOUS ZONE
A Rational National Policy on Public Use of the Beaches,
W77-08976 6E

CONTINENTAL SHELF
Comparison of Remotely Sensed Continental-Shelf Wave Spectra with Spectra Computed by Using a Wave Refraction Computer Model,
W77-08911 2L

Wave Refraction Diagrams for the Baltimore Canyon Region of the Mid-Atlantic Continental Shelf Computed by Using Three Bottom Topography Approximation Techniques,
W77-08912 2L

As an Incident of National Sovereignty, th United States Has Paramount Rights an Power in the Seabed and Subsoil of the Out Continental Shelf,
W77-08974 6

Preliminary Summary of the 1976 Atlantic Ma gin Coring Project of the U.S. Geological Su vey,
W77-09089 2

CONTINUITY EQUATION
Surface-Groundwater Interactions and the Co junctive Use of the Water Resources of th Mullica River Basin, New Jersey,
W77-08810 4

CONTINUOUS FLOW
Effects of Temperature and Kelthane on Gra Shrimp,
W77-08874 5

CONTROL STRUCTURES
Flood Plain Information: Albuquerque A royas, Part V, Albuquerque, New Mexico.
W77-08611 4

CONTROL SYSTEMS
WATSIM - A Fortran Program for 24 Hou Simulation of Flows and Reservoir Fluctu tions in Water Distribution Networks,
W77-08943 7

COOLING WATER
Harbor and Nearshore Currents, Oswego Ha bor, New York,
W77-08913 2

COOPERATIVE WATER-STUDIES PROGRAM
Water-Resources Investigations in Kentucky 1976.
W77-09078 7

Water-Resources Investigations in Wisconsi 1976.
W77-09079 7

COPEPODS
Effects of a Spill of Marine Diesel Oil on th Meiofauna of a Sandy Beach at Picnic Bay Hong Kong,
W77-08760 5

The Effect of Warm Effluent from th Novorossiysk Thermal Power Plan o Zooplankton,
W77-08804 5

COPPER
Algal Uptake of Copper from Compounds an Its Effect on Salt Metabolism in Algae,
W77-08792 5

Production and Heavy Metal Concentration o Vascular Aquatic Macrophytes in Three Eas ern Connectituct Rivers,
W77-08814 5

CORE ANALYSES
Report on Preliminary Data for Madiso Limestone Test Well No. 1, NE1/4SE1/4 Se 15, T. 57 N., R. 65 W., Crook County, Wyom ing,
W77-09072 4

CORE DRILLING
Preliminary Summary of the 1976 Atlantic Ma gin Coring Project of the U.S. Geological Su vey,
W77-09089 2

LIBRARY OF THE UNIVERSITY OF ILLINOIS

CORE LOGGING
Preliminary Summary of the 1976 Atlantic Margin Coring Project of the U.S. Geological Survey,
W77-09089 2L

CORES
Study of an Ice Core to the Bedrock in the Accumulation Zone of an Alpine Glacier,
W77-08846 2C

COST-BENEFIT ANALYSIS
Recreational Water Resources Problems.
W77-08711 6B

Economics of Permanent Flood-Plain Evacuation,
W77-08856 6B

COST SHARING
User Charges in Inland Navigation Policy,
W77-08604 6C

COSTS
Pretreatment Helps Niagara Cut Costs,
W77-08633 5D

Make Money by Computer,
W77-08730 5D

Economic Evaluation of Idaho's Water Supply,
W77-08816 6B

Water Supply Economics,
W77-08863 6B

Incidence of the Benefits and Costs of Environmental Programs,
W77-08870 6G

COTTONTAIL RABBITS
Population Response and Heavy Metal Concentrations in Cottontail Rabbits and Small Mammals in Wastewater Irrigated Habitats,
W77-09097 5B

COUNTY PLANNING
Integrated Evaluation Programs for Fairfax County, Va.,
W77-08862 6B

CRABS
Effects of Mercury, Cadmium, and Lead Salts on Regeneration and Ecdysis in the Fiddler Crab, UCA Pugilator,
W77-08702 5C

Fate of Labeled n-Alkanes in the Blue Crab and Stripped Mullet,
W77-08764 5C

CROP PRODUCTION
Evaluation of Wheat Plants with Regard to Drought- and Heat-Resistance Under Field Conditions, (In Russian),
W77-08877 3F

CROP RESPONSE
Distribution of Corn Roots in Sandy Soil with a Declining Water Table,
W77-08676 2I

Effects of Treated Municipal Wastewater and Commercial Fertilizer on Growth, Fiber, Acid-Soluble Nucleotides, Protein and Amino Acid Content in Wheat Hay,
W77-08876 5C

CROSSFLOW
Mean Behavior of Buoyant Jets in a Crossflow
W77-09013 8B

CRUDE OIL
Effect of the Water-Soluble Fractions of Crude, Refined and Waste Oils on the Embryonic and Larval Stages of the Quahog Clam Mercenaria sp.,
W77-08794 5C

CRUSTACEANS
Concentrations of PCBs, Dieldrin and DDT Residues in Marine Animals from Liverpool Bay,
W77-08788 5C

Minimum Oxygen Levels Survived by Stream Invertebrates,
W77-08926 5C

CUBIC CURVED TRIANGULAR ELEMENTS
Numerical Solution for Flow Under Sluice Gates,
W77-09012 8B

CULTURES
Environmental Regulation of Gametogenesis in Scenedesmus Obliquus,
W77-09060 5C

CULVERTS
Predicting Performance of Pipe Culverts Buried in Soil,
W77-08622 8B

CURDE OIL
Sources of Tar Pollution on Israeli Mediterranean Coast,
W77-08852 5B

CURRENT METERS
Current-Meter Recordings of Low-Speed Turbidity Currents,
W77-08847 2L

A Review of Velocity-Measuring Devices,
W77-09085 7B

CURRENTS (WATER)
Current-Meter Recordings of Low-Speed Turbidity Currents,
W77-08847 2L

Oceanographic Features, Currents, and Transport in Cabot Strait,
W77-08851 2L

The Third London Airport Study,
W77-09037 2L

CURRENTS (WATER WAVES)
Harbor and Nearshore Currents, Oswego Harbor, New York,
W77-08913 2L

CURVED FLOW
A Mathematical Model of Steady Flow in Curved Shallow Channels,
W77-09036 8B

CURVED STREAM BEDS
Roughness Effects on the Flow Direction Near Curved Stream Beds,
W77-09038 8B

CYANOPHYTA
Biologically Active Metabolites of Blue-Green Algae and Their Effect on Experimental Animals, (In Russian),
W77-08749 5C

Physical and Chemical Parameters Associated with Phytoplankton Abundance and Periodicity in a Fertilized Fish Pond,
W77-08922 5C

CYCLICITY
Point Stochastic Analysis of Daily Rainfall Occurrence with Application to Indiana,
W77-08935 2B

CYPRUS
Hydrothermal Fluids of Seawater Salinity in Ophiolitic Sulphide Ore Deposits in Cyprus,
W77-08854 2L

CYTOLOGICAL STUDIES
Neoplastic and Possibly Related Skin Lesions in Neotenic Tiger Salamanders from a Sewage Lagoon,
W77-08729 5C

CZECHOSLOVAKIA
Results of a Microbiological Investigation of the Danube River by One Point Profile (1969-1971), (In German),
W77-08694 5B

DAIRY INDUSTRY
Enzymatic Treatment of Dairy Effluents,
W77-08937 5D

DAMAGE
Economics of Permanent Flood-Plain Evacuation,
W77-08856 6B

DAMAGES
Avoiding the Perils of Cavitation,
W77-08674 8C

DAMS
Flood Plain Information: Ohio River, Lawrence County, Ohio.
W77-08614 4A

Flood Plain Information: Ashuelot River, City of Keene, New Hampshire.
W77-08615 4A

Load Transfer and Hydraulic Fracturing in Zoned Dams,
W77-08857 8B

Homeowners Emergency Life Protection Committee V. Lynn (Enjoining of Major Federal Activity with Alleged Inadequate Environmental Impact Statement).
W77-09003 6E

Polymerization of Concrete Fights Cavitation,
W77-09044 8F

DANUBE RIVER
Results of a Microbiological Investigation of the Danube River by One Point Profile (1969-1971), (In German),
W77-08694 5B

Dispersion Measurement on the Danube,
W77-09040 5B

DAPHNIA ZOOPLANKTON
Effects of Sublethal Concentrations of the Herbicide Atrazin on Growth and Reproduction of Daphnia Pulex,
W77-08786 5C

DARCYS LAW
Surface-Groundwater Interactions and the Conjunctive Use of the Water Resources of the Mullica River Basin, New Jersey,
W77-08810 4B

DATA COLLECTION
Observation Records of Ground Water Level, (In Japanese),
W77-08904 4B

DATA COLLECTIONS
Records of Wells, Water-Level Measurements, and Drillers' Logs, Red River Valley, Louisiana,
W77-08734 7C

Indiana Stream-Temperature Characteristics,
W77-08755 7C

Compilation of Temperature Preference Data,
W77-08767 7C

Environmental Planning for an Alaskan Water-Oriented Recreation Area,
W77-08805 6B

Frequency of Organic Compounds Identified in Water,
W77-08944 5A

DATA STORAGE AND RETRIEVAL
HISARS - Hydrologic Information Storage and Retrieval System - Reference Manual,
W77-08610 7C

Frequency of Organic Compounds Identified in Water,
W77-08944 5A

DDT
Concentrations of PCBs, Dieldrin and DDT Residues in Marine Animals from Liverpool Bay,
W77-08788 5C

DEBRIS FLOW
Flow Regimes in Debris Flow,
W77-09045 2J

DECENTRALIZATION
Water Supply Economics,
W77-08863 6B

DECHLORINATION
Photochemical Dechlorination of Water Supply for Fish Tanks with Commercial Water Sterilizers,
W77-08842 5F

DECISION THEORY
Practical use of Decision Theory to Assess Uncertainties about Actions Affecting the Environment,
W77-08927 6G

DECISION UTILITY THEORY
Utility Analysis for the Urban Growth Inside the Recharge Zones of the Groundwater Resources of San Antonio, Texas,
W77-08713 6B

DECOMPOSING ORGANIC MATTER
Eutrophication of an Impounded Estuarine Lagoon,
W77-08778 5C

Species Differences in Breakdown of Tree Leaves in Streams--Significance for Composition of Stream Communities,
W77-09056 5B

DEEP WATER
Rykar V Gill (State's Refusal to Allow Upland Owner to Fill Adjacent Marshland Because of Owner's Access to Deep Water by Use of Wharfing Techniques),
W77-09005 6E

DEEP-WELL TURBINE PUMPS
Water Turbine Pump Failure,
W77-08656 8G

DEEPWATER PORT ACT OF 1974
Site Evaluation and Preconstruction Testing at Potential Deepwater Port Locations.
W77-08989 6E

DEEPWATER PORTS
Site Evaluation and Preconstruction Testing at Potential Deepwater Port Locations.
W77-08989 6E

DEER
Deer Habitat Response to Irrigation with Municipal Wastewater,
W77-09099 5C

DEER HABITAT
Deer Habitat Response to Irrigation with Municipal Wastewater,
W77-09099 5C

DEFOLIANTS
Study on the Post-Mortem Identification of Pollutants in the Fish Killed by Water Pollution: Detection of Arsenic,
W77-08775 5A

DENITRIFICATION
N2 : Ar, Nitrification and Denitrification in Southern California Borderland Basin Sediments,
W77-08907 5A

DENMARK
Ground Water Model for the Island of Anholt, Denmark,
W77-09030 2F

DENSITY CURRENTS
Density Currents and Their Applications,
W77-08844 5B

DEPOSITION (SEDIMENTS)
Grain-Size Parameters of Insoluble Residues in Mixxed Terrigenous-Skeletal Carbonate Sediments and Sedimentary Rocks: Some New Zealand Examples,
W77-08848 2L

DEPTH
New Sampler for Shallow-Water Benthic Macroinvertebrates,
W77-08801 7B

DESIGN
A Pneumatic Dosing Apparatus for Flow-Through Bioassays,
W77-08763 5A

DESIGN CRITERIA
The Use of Packed Beds in Water Pollution Control,
W77-08637 5D

Rational Design of Aerobic Digestion Systems,
W77-08643 5D

Designing for Sediment Transport,
W77-08962 4D

DETENTION BASINS
Design Efficiency of Stormwater Detention Basins,
W77-08841 4D

DETENTION RESERVOIRS
Design Efficiency of Stormwater Detention Basins,
W77-08841 4D

DEVELOPING NATIONS
Sewage Treatment in Developing Countries,
W77-08635 5D

DEWATERING
Dewatering Chemical-Primary Sludges,
W77-08865 5

Hydrologic Considerations in Dewatering an Refilling Lake Carlton, Orange and Lake Cou ties, Florida,
W77-09080 5

DIBROMOPROPANE
Experimental Data on the Regulation of 1, Dibromopropane in Reservoir Water, (In Ru sian),
W77-08718 5

DIELDRIN
Concentrations of PCBs, Dieldrin and DD Residues in Marine Animals from Liverpo Bay,
W77-08788 5

DIFFUSION
Snowmelt: A Two-Dimensional Turbulent Di fusion Model,
W77-08823 2

Thermal Loading of Natural Streams,
W77-09068 5

DIFFUSIVITY
Flow Characteristics During Infiltration into Horizontal Sand Column,
W77-08826 2

DIPTERA
Density and Distribution of Benthos in Lak Keowee, South Carolina,
W77-08818 5

Chironomid Fauna of the Upper Course of th Iseti River, (In Russian),
W77-09048 5

DIRECT FILTRATION
Influence of Initial Mixing on Direct Filtration
W77-08809 5

Direct Filtration of Lake Michigan Water,
W77-08812 5

DISCHARGE MEASUREMENT
A Review of Velocity-Measuring Devices,
W77-09085 7

DISEASES
A Study of Heavy Metals in Lake Abbaya Ethiopia, and the Incidence of Non-Parasiti Elephantiasis,
W77-08774 5A

DISINFECTION
Ozone Disinfection of Secondary Effluent,
W77-08638 5

DISPERSION
Simulation of Pollutant Movement in Ground water Aquifers,
W77-08807 5

Detergent Composition for Dispersing Oi Spills,
W77-08884 5

Mean Behavior of Buoyant Jets in a Crossflow
W77-09013 8

Dispersion Measurement on the Danube,
W77-09040 5

DISSOLVED CONSTITUENTS
Chemical Character of Headwater Streams in Vermont and New Hampshire,
W77-09027 2K

DISSOLVED ORGANIC CARBON
The Effect of the Willimantic Sewage Treatment Plant on the Microflora and Metabolism of the Shetucket River,
W77-09094 5C

DISSOLVED OXYGEN
Effect of the Boundary Surface Between Sea and Fresh Waters on the Distribution of Dissolved Oxygen in the Mouth Region of the Dnieper River,
W77-08832 5B

Systematic Identification of DO-BOD Model Structure,
W77-08866 5B

Reaeration and Velocity Prediction for Small Streams,
W77-08867 5B

Minimum Oxygen Levels Survived by Stream Invertebrates,
W77-08926 5C

Seasonal Patterns of Dissolved Oxygen, Nutrients, and Metals in Natural and Channelized Swamp Streams,
W77-08932 5B

Hyperoxygen Concentrations in the Hypolimnion Produced by Injection of Liquid Oxygen,
W77-09028 5G

DISSOLVED SOLIDS
The Behaviour of Dissolved Iron, Manganese and Zinc in the Beaulieu Estuary, S. England,
W77-08701 5B

DISTRIBUTION
Thermal and Chemical Problems of Thermal Waters, Symposium.
W77-08677 2K

Temperature and Chemism of Ground Waters in the Western Areas of the East European Platform,
W77-08683 2K

The Distribution of Trace Metals in the Western North Atlantic Off Nova Scotia,
W77-08703 5B

Density and Distribution of Benthos in Lake Keowee, South Carolina,
W77-08818 5C

DISTRIBUTION PATTERNS
Multivariate Distributions in Hydrology and River Regulation,
W77-09029 2E

DISTRIBUTION SYSTEMS
Irrigation Sprinkling Apparatus with Adjustable Ground Contacting Elements,
W77-08886 3F

Improved Methodology for Design and Operation of Water Distribution Systems, (Parts I-III),
W77-08940 4A

WATSIM - A Fortran Program for 24 Hour Simulation of Flows and Reservoir Fluctuations in Water Distribution Networks,
W77-08943 7C

DIURNAL DISTRIBUTION
Comprehensive Oceanographic Baseline Study at Barceloneta, Puerto Rico.
W77-08853 5B

DNIEPER RIVER
Effect of the Boundary Surface Between Sea and Fresh Waters on the Distribution of Dissolved Oxygen in the Mouth Region of the Dnieper River,
W77-08832 5B

DOCUMENTATION
Chippewa Flowage Investigations. Part 3A: Appendixes.
W77-08726 6B

Chippewa Flowage Investigations. Part 3B: Appendixes.

FLUCTUATIONS
Aspects of the Daily and Seasonal Course of Transpiration Intensity in Meadow Plants, (In Russian),
W77-08709 2D

FLUID DYNAMICS
Seismic Design of Liquid-Storage Tanks,
W77-08859 8D

FLUMES
Resistance of Two Dimensional Triangular Roughness,
W77-09035 8B

FLUORESCENCE
A Fluorescence Immunoassay Technique for Detecting Organic Environmental Contaminants,
W77-08947 5A

FLUORINE
Removal of Fluorine from Waste Waters. III. Fundamental Tests with Chemical Reagents (Haisuichu no fusso jokyo nikansuru kenkyu. III. Shiyaku kei niyoru kisoshiken),
W77-08626 5D

FOOD CHAINS
Estimation and Evaluation of Radioactive Contamination Through a Food Web in an Aquatic Ecosystem: I. An Application of the Compartment Model to Transfer of Radioactive Substances Through a Food Chain,
W77-08695 5C

Fate and Biological Effects of Mercury Introduced into Artificial Streams,
W77-08757 5C

Polychlorinated Biphenyls in Adult Mayflies (Hexagenia bilineata) from the Upper Mississippi River,
W77-08783 5C

FORECASTING
The Residual Oxygen Bioassay: A Rapid Procedure to Predict Effluent Toxicity to Rainbow Trout,
W77-08766 5A

Lake-Shoreland Management Programs: Selected Papers,
W77-08924 2H

Improved Methodology for Design and Operation of Water Distribution Systems, (Parts I-III),
W77-08940 4A

Coupled Dynamic Streamflow-Temperature Models,
W77-09014 2E

FOREST MANAGEMENT
Effects of Stream Channelization on Bottomland and Swamp Forest Ecosystems,
W77-08920 4A

FOREST SOILS
Effects of Stream Channelization on Bottomland and Swamp Forest Ecosystems,
W77-08920 4A

FOREST WATERSHEDS
An Assessment of Snowpack Depletion-Surface Runoff Relationships on Forested Watersheds,
W77-08933 3B

FORESTRY
Effect of Agricultural and Silvicultural Practices on the Runoff from Drainage Basins of the Nizhnedevitskaya Hydrologic Station,
W77-08835 4C

FORM DRAG
Resistance of Two Dimensional Triangular Roughness,
W77-09035 8B

FRACTURES (GEOLOGIC)
Load Transfer and Hydraulic Fracturing in Zoned Dams,
W77-08857 8B

FRACTURING
Load Transfer and Hydraulic Fracturing in Zoned Dams,
W77-08857 8B

FRANCE
Qualitative and Quantitative Changes in the Benthic Fauna of a Trout Stream, the Couze Pavin Puy-De-Dome, Caused by Agricultural and Urban Pollution, (In French),
W77-08955 5C

FRANCE (PYRENES)
The Content of Silica in Hot Mineral Waters of France in Relation to Temperature, Sodium Content and Bicarbonates (La Teneur en Silice des eaux Thermominerales de France en Relation Avec la Temperature, la Teneur en Sodium et en Bicarbonates),
W77-08686 2K

FREQUENCY OF OCCURRENCE (WASTES)
Frequency of Organic Compounds Identified in Water,
W77-08944 5A

FRESHWATER
Inland Waters. Monographs from Limnology and Related Areas, Vol. 26, Part 1. The Zooplankton of Inland Waters,
W77-08861 2H

FRESHWATER FISH
Effect of Hot Effluent Discharge from the Konakovo Power Plant on the Growth of Bream in Ivan'Kovo Reservoir,
W77-08803 5C

FRESHWATER LENSES
A Mathematical Model Study of Fresh-Water Lenses,
W77-08837 2F

FROGS
The Effect of Two Pesticides, Miedzian 50 and Gesagard 50, on the Development of Tadpoles of Rana temporaria,
W77-08776 5C

FROZEN SOILS
Water and Ice Potentials in Frozen Soils,
W77-08828 2C

GAMETOGENESIS
Environmental Regulation of Gametogenesis in Scenedesmus Obliquus,
W77-09060 5C

GASOLINE COMBUSTION FALLOUT
Production and Heavy Metal Concentration of Vascular Aquatic Macrophytes in Three Eastern Connectituct Rivers,
W77-08814 5B

GENETICS
Incorporation of Benzathrone into the Nuclei of Gyrodinium sp. and the Heredity of Consequent Mitotic Delays,
W77-08796 5C

GEOCHEMISTRY
Thermal and Chemical Problems of Thermal Waters, Symposium.
W77-08677 2K

Some Features of the Geochemistry of Thermal Water in Platform Areas from Experimental Data,
W77-08679 5B

The Helium Isotopes in Thermal Fluids,
W77-08680 5B

Hydrothermal Processes in the Atlantic Ocean Crust, 26 Degrees N,
W77-08681 2K

Geochemistry of Thermal Waters from Various Geothermal Provinces of India,
W77-08682 2K

Temperature and Chemism of Ground Waters in the Western Areas of the East European Platform,
W77-08683 2K

Geochemistry and Origin of Thermal Waters in Poland,
W77-08684 2K

Thermal Waters in Taiwan, A Preliminary Study,
W77-08685 4B

The Content of Silica in Hot Mineral Waters of France in Relation to Temperature, Sodium Content and Bicarbonates (La Teneur en Silice des eaux Thermominerales de France en Relation Avec la Temperature, la Teneur en Sodium et en Bicarbonates),
W77-08686 2K

Studies by the Dynamic Method on the Reaction of Rock with Hot Spring Water of the Tamagawa Hot Springs in Japan,
W77-08689 2K

GEOLOGIC INVESTIGATIONS
Geothermal Energy Development,
W77-08661 4B

GEOLOGY
Study of the Chemical and Gaseous Composition of Thermal Waters of the Eastern Part of the Pannonian Depression (Considerations sur la Composition Chimique et Gazeuse des eaux Thermales de la Partie Orientale de la Depression Pannonique (Roumanie)),
W77-08688 2K

GEOMORPHOLOGY
The Maximum Extent of Glaciers in Part of West Falkland,
W77-09032 2C

GEORGIA
Storm Tide Frequency Analysis for the Coast of Georgia,
W77-08914 2L

GEOTHERMAL STUDIES
A Case for Geothermal Energy,
W77-08655 8C

Economics of Geothermal Energy Development (In Imperial County, California),
W77-08657 8C

Geothermal Energy Development,
W77-08661 4B

Thermal and Chemical Problems of Thermal Waters, Symposium.
W77-08677 2K

Geochemistry of Thermal Waters from Various Geothermal Provinces of India,
W77-08682 2K

Geochemistry and Origin of Thermal Waters in Poland,
W77-08684 2K

Thermal Waters in Taiwan, A Preliminary Study,
W77-08685 4B

The Content of Silica in Hot Mineral Waters of France in Relation to Temperature, Sodium Content and Bicarbonates (La Teneur en Silice des eaux Thermominerales de France en Relation Avec la Temperature, la Teneur en Sodium et en Bicarbonates),
W77-08686 2K

Some Geochemical Problems in the Utilization of Geothermal Waters,
W77-08687 5B

Studies by the Dynamic Method on the Reaction of Rock with Hot Spring Water of the Tamagawa Hot Springs in Japan,
W77-08689 2K

Important Geothermal Sites in Greece, on the Base of Thermomineral Spring Layings, and the Possibilities of Their Exploitation and Utilisation,
W77-08690 4B

Total Energy Use in an Urban-Agricultural Power Plant Complex,
W77-08691 5G

An Energy Accounting Evaluation of Several Alternatives for Hydropower and Geothermal Development,
W77-09057 6B

Hydrologic Reconnaissance of the Geothermal Area Near Klamath Falls, Oregon, with a Section on Preliminary Interpretation of Geophysical Data,
W77-09070 4B

Chemical and Isotopic Investigations of Groundwater in Potential Geothermal Areas in Hawaii,
W77-09082 2K

GEOTHERNMAL STUDIES
Study of the Chemical and Gaseous Composition of Thermal Waters of the Eastern Part of the Pannonian Depression (Considerations sur la Composition Chimique et Gazeuse des eaux Thermales de la Partie Orientale de la Depression Pannonique (Roumanie)),
W77-08688 2K

GESAGARD 50
The Effect of Two Pesticides, Miedzian 50 and Gesagard 50, on the Development of Tadpoles of Rana temporaria,
W77-08776 5C

GLACIATION
The Maximum Extent of Glaciers in Part of West Falkland,
W77-09032 2C

GLACIERS
Was There a Late-Wurm Arctic Ice Sheet,
W77-08839 2C

Study of an Ice Core to the Bedrock in the Accumulation Zone of an Alpine Glacier,
W77-08846 2C

The Maximum Extent of Glaciers in Part of West Falkland,
W77-09032 2C

An Experimental Study of the Motion of Ice Past Obstacles by the Process of Regelation,
W77-09033 2C

GLOBAL WATER LAW SYSTEMS
Proceedings of the International Conference on Global Water Law Systems, September 1-9, 1975, Valencia, Spain.
W77-08966 6E

GLUCOSE
Development of a Blood Sugar Bioassay for Rapidly Measuring Stressful Levels of Pulpmill Effluent to Salmonid Fish,
W77-08779 5A

GLYCOGEN
Survival of Bacteria in Turbid and Polluted Waters,
W77-08606 5C

GNATHONEMUS
The Effect of the Impoundment of Lake Kainji, Nigeria, on the Indigenous Species of Mormyrid Fishes,
W77-08772 5C

GOVERNMENT SUPPORTS
What 208 Planning Can Do: A Local and Federal View,
W77-08968 6E

GOVERNMENTAL INTERRELATIONS
Many Changes Urged for PL 92-500,
W77-08950 5C

What 208 Planning Can Do: A Local and Federal View,
W77-08968 6E

GRADIENT DEVICES
Laboratory Methods for Determining Temperature Preference,
W77-08770 5C

GRADIENT TROUGH
Avoidance of Bleached Kraft Pulpmill Effluent by Pinfish (Lagodon Rhomboides) and Gulf Killifish (Fundulus Grandis),
W77-08780 5C

GRAND CAYMAN ISLAND
A Mathematical Model Study of Fresh-Water Lenses,
W77-08837 2F

GRAND TETON NATIONAL PARK (WYO)
Preliminary Study of Wastewater Movement in and Near Grand Teton National Park, Wyoming, Through October 1976,
W77-09087 5E

GRAPHICAL ANALYSIS
Principles of Graphical Gradually Varied Flow Model,
W77-09015 2E

GRASS FILTRATION SYSTEM
Phosphate and Nitrate Removal by a Grass Filtration System for Final Treatment of Municipal Waste Water,
W77-09100 5E

GRASS SHRIMP
Toxicity, Accumulation, and Release of Three Polychlorinated Naphthalenes (Halowax 1000, 1013, and 1099) in Postlarval and Adult Grass Shrimp, Palaemonetes Pugio,
W77-08773 5C

GRASSED WATERWAYS
Performance Characteristics of a Grassed-Waterway Transition,
W77-08849 4D

GRAY SQUIRREL
Trap Responses of the Gray Squirrel (Sciurus carolinensis carolinensis), Raccoon (PRocyon lotor lotor), and Opossum (Didelphis virginiana virginiana) to Environmental Factors in Two Swamp Watersheds of Northeastern North Carolina,
W77-08936 6G

GREAT BRITAIN
A Case for Geothermal Energy,
W77-08655 8C

GREAT LAKES
The Management of International Boundary Waters of Canada and the United States: A Comparative Study,
W77-08720 6E

Estimation of Winds Over the Great Lakes,
W77-09022 2H

GREECE (NEOVOLCANIC REGIONS)
Important Geothermal Sites in Greece, on the Base of Thermomineral Spring Layings, and the Possibilities of Their Exploitation and Utilisation,
W77-08690 4B

GREEN RIVER (MASS)
Characterization of Urban Runoff in Greenfield, Massachusetts--Phase I,
W77-08939 5B

GROUNDWATER
Ground Water - Solar Heat,
W77-08652 8C

Ground Water Budget of the Mountainous Regions of Hungary, (In Hungarian),
W77-08663 2F

An Ecological Model for Heavy Metal Contamination of Crops and Ground Water,
W77-08706 5B

The Hydrogeologic Regime of Glacial-Terrain Lakes, with Management and Planning Applications,
W77-08724 2F

Water Resources Data for Washington, Water Year 1975.
W77-08737 7C

Water Resources Data for Montana, Water Year 1975.
W77-08738 7C

Artificial Recharge for Subsidence Abatement at the NASA-Johnson Space Center, Phase I,
W77-08744 4B

Water for Industrial and Agricultural Development in Attala, Holmes, Humphreys, Issaquena, Sharkey, and Yazoo Counties, Mississippi,
W77-08748 4B

Soil and Rock Strata to Trap, Filter and Store Water for Rural Domestic use,
W77-08821 3B

A Mathematical Model Study of Fresh-Water Lenses,
W77-08837 2F

Digital Model Studies of Steady-State Radial Flow to Partially Penetrating Wells in Alluvial Plains,
W77-08838 2F

Observation Records of Ground Water Level, (In Japanese),
W77-08904 4B

United States V. GAF Corporation: A Leak in the FWPCA,
W77-08979 5G

A 'Rough Cut' Model of a South Florida Water Supply Plan,
W77-08980 4B

Ground-Water Use Act (Regulation of Ground Water Resources Thru a Permit System).
W77-08999 6E

Ground Water Model for the Island of Anholt, Denmark,
W77-09030 2F

Transjoen, A Groundwater Influenced Lake with Special Redox and Sulphate Conditions,
W77-09031 2H

Solute Travel Times to Wells,
W77-09042 5B

Selected Problems in Idaho Ground Water Law,
W77-09049 6E

Hydrologic Reconnaissance of the Geothermal Area Near Klamath Falls, Oregon, with a Section on Preliminary Interpretation of Geophysical Data,
W77-09070 4B

Water Resources Data for Mississippi, Water Year 1975.
W77-09074 7C

Water Resources Data for North Dakota, Water Year 1975.
W77-09075 7C

Chemical and Isotopic Investigations of Groundwater in Potential Geothermal Areas in Hawaii,
W77-09082 2K

Integral Equation for the Description of Stream-Aquifer Interaction,
W77-09092 2F

GROUNDWATER AVAILABILITY
Availability of Ground Water in the Middle Merrimack River Basin, Central and Southern New Hampshire,
W77-08733 7C

Ground-Water Use Act (Regulation of Ground Water Resources Thru a Permit System).
W77-08999 6E

GROUNDWATER BASINS
Ground Water Budget of the Mountainous Regions of Hungary, (In Hungarian),
W77-08663 2F

GROUNDWATER MODELS
Ground Water Model for the Island of Anholt, Denmark,
W77-09030 2F

GROUNDWATER MOVEMENT
Simulation of Pollutant Movement in Groundwater Aquifers,
W77-08807 5B

Digital Model Studies of Steady-State Radial Flow to Partially Penetrating Wells in Alluvial Plains,
W77-08838 2F

Finite Element Solution of the Two-Dimensional Unsaturated Flow Equation,
W77-08923 2G

Transient Analysis of Phreatic Aquifers Lying Between Two Open Channels,
W77-09026 2F

Ground Water Model for the Island of Anholt, Denmark,
W77-09030 2F

Solute Travel Times to Wells,
W77-09042 5B

Analog Simulation of the Ground-Water System, Yuma, Arizona,
W77-09067 2F

GROUNDWATER RECHARGE
Character of Seepage of Precipitation to the Water Table in the Central Forest Steppe,
W77-09043 4B

Artificial Recharge to a Freshwater-Sensitive Brackish-Water Sand Aquifer, Norfolk, Virginia,
W77-09066 4B

GROUNDWATER RESOURCES
Utility Analysis for the Urban Growth Inside the Recharge Zones of the Groundwater Resources of San Antonio, Texas,
W77-08713 6B

Annual Summary of Ground-Water Conditions in Arizona, Spring 1975 to Spring 1976,
W77-08732 7C

Availability of Ground Water in the Middle Merrimack River Basin, Central and Southern New Hampshire,
W77-08733 7C

Guide for Data Collection to Calibrate a Predictive Digital Ground-Water Model of the Unconfined Aquifer in and Near the City of Modesto, California,
W77-08735 2F

Outline of the Water Resources of the Satus Creek Basin, Yakima Indian Reservation, Washington,
W77-08740 4B

Water-Level Changes in Northwestern Kansas, 1950-76,
W77-08742 4B

Ground-Water Data for Michigan, 1975,
W77-08753 7C

A 'Rough Cut' Model of a South Florida Water Supply Plan,
W77-08980 4B

Ground-Water Use Act (Regulation of Ground Water Resources Thru a Permit System).
W77-08999 6E

Report on Preliminary Data for Madison Limestone Test Well No. 1, NE1/4SE1/4 Sec. 15, T. 57 N., R. 65 W., Crook County, Wyoming,
W77-09072 4B

Geologic Data from Test Drilling in Palm Beach County, Florida Since 1970,
W77-09073 7C

GROUNDWATER RESOURCES

Ground-Water Resources and Geology of Walworth County, Wisconsin,
W77-09081 2F

Ground-Water Hydrology of Berkeley County, West Virginia,
W77-09083 4B

Water-Level Records for the San Luis Valley of Colorado, 1973-77,
W77-09088 7C

GROUNDWATER-SURFACE WATER RELATIONSHIPS

The Hydrogeologic Regime of Glacial-Terrain Lakes, with Management and Planning Applications,
W77-08724 2F

GROWTH MEDIA EVALUATION

Willimantic River Organisms Grown in Media with Natural Substrate Levels as Inocula for Algal Assays,
W77-09091 5C

GROWTH RATE

Effect of Hot Effluent Discharge from the Konakovo Power Plant on the Growth of Bream in Ivan'Kovo Reservoir,
W77-08803 5C

GROWTH RATES

Effect of Water Deficiency on the Growth Rate of Some Winter Soft Wheat Cultivars, (In Bulgarian),
W77-08716 3F

Effects of Dipotassium Endothall on Rooted Aquatics and Adult and First Generation Bluegills,
W77-08785 5C

Effects of Sublethal Concentrations of the Herbicide Atrazin on Growth and Reproduction of Daphnia Pulex,
W77-08786 5C

Optimal Temperature for Growth of Juvenile Bluegills,
W77-08798 5C

Effects of Primary Treated and Biologically Stabilized Kraft Mill Effluents on the Production, Biomass and Growth Rates of Juvenile Salmonids in Three Stream Channels,
W77-08921 5C

Willimantic River Organisms Grown in Media with Natural Substrate Levels as Inocula for Algal Assays,
W77-09091 5C

GROWTH STAGES

Neoplastic and Possibly Related Skin Lesions in Neotenic Tiger Salamanders from a Sewage Lagoon,
W77-08729 5C

Toxicity, Accumulation, and Release of Three Polychlorinated Naphthalenes (Halowax 1000, 1013, and 1099) in Postlarval and Adult Grass Shrimp, Palaemonetes Pugio,
W77-08773 5C

The Effect of Two Pesticides, Miedzian 50 and Gesagard 50, on the Development of Tadpoles of Rana temporaria,
W77-08776 5C

Effects of Dipotassium Endothall on Rooted Aquatics and Adult and First Generation Bluegills,
W77-08785 5C

GULF OF MEXICO

Cooperative Gulf of Mexico Estuarine Inventory and Study--Texas: Area Description,
W77-08916 2L

GYRODINIUM

A Certain Marine Catenate Dinoflagellate Tentatively Applied for Detecting Carcinogens,
W77-08795 5A

Incorporation of Benzathrone into the Nuclei of Gyrodinium sp. and the Heredity of Consequent Mitotic Delays,
W77-08796 5C

HACKENSACK MEADOWLANDS (NJ)

Solid Waste Management: A Test of Alternative Strategies Using Optimization Techniques,
W77-08723 5E

HALOGENATED PESTICIDES

The Accumulation of Polybominated Biphenyls by Fish,
W77-08777 5C

HALOWAX

Toxicity, Accumulation, and Release of Three Polychlorinated Naphthalenes (Halowax 1000, 1013, and 1099) in Postlarval and Adult Grass Shrimp, Palaemonetes Pugio,
W77-08773 5C

HARBORS

Site Evaluation and Preconstruction Testing at Potential Deepwater Port Locations.
W77-08989 6E

HARPTICOIDS

Effects of a Spill of Marine Diesel Oil on the Meiofauna of a Sandy Beach at Picnic Bay, Hong Kong,
W77-08760 5C

HAWAII

Nitrogen Removal from Secondary Effluent by a Laboratory Soil Column,
W77-08607 5B

Mineral Distribution Within the Sediments of Pearl Harbor,
W77-08815 2L

Ground-Water Use Act (Regulation of Ground Water Resources Thru a Permit System).
W77-08999 6E

Molokai Irrigation and Water Utilization Project.
W77-09000 6E

Chemical and Isotopic Investigations of Groundwater in Potential Geothermal Areas in Hawaii,
W77-09082 2K

HAWAII BOARD OF LAND AND NATURAL RESOURCES

Molokai Irrigation and Water Utilization Project.
W77-09000 6E

HAY

Effects of Treated Municipal Wastewater and Commercial Fertilizer on Growth, Fiber, Acid-Soluble Nucleotides, Protein and Amino Acid Content in Wheat Hay,
W77-08876 5C

HAZARDOUS SUBSTANCES

To Extend the Marine Protection, Research, and Sanctuaries Act (Hearing on S 3147 to Extend the Act 2 Years).
W77-08981 6E

HAZARDS

Agents, Methods and Devices for Amelioration of Discharges of Hazardous Chemicals on Water,
W77-08910 5G

HEADWATER STREAMS

Chemical Character of Headwater Streams in Vermont and New Hampshire,
W77-09027 2K

HEARINGS

Changes Urged at NCWQ Hearings,
W77-08967 6E

HEAT EXCHANGERS

Induced Vertical Mixing in a Stratified Impoundment by a Subsurface Warm Water Discharge,
W77-08929 5E

An Energy Accounting Evaluation of Several Alternatives for Hydropower and Geothermal Development,
W77-09057 6E

HEAT RESISTANCE

Evaluation of Wheat Plants with Regard to Drought- and Heat-Resistance Under Field Conditions, (In Russian),
W77-08877 3F

HEAT STORAGE (ENERGY)

Ground Water - Solar Heat,
W77-08652 8G

HEAT TRANSFER

Snowmelt: A Two-Dimensional Turbulent Diffusion Model,
W77-08823 2C

Thermal Loading of Natural Streams,
W77-09068 5E

HEAT TREATMENT

Sludge Treatment: Problems and Solutions Part 1,
W77-08640 5E

HEATED WATER

Hydrothermal Processes in the Atlantic Ocean Crust, 26 Degrees N,
W77-08681 2K

Some Geochemical Problems in the Utilization of Geothermal Waters,
W77-08687 5E

Studies by the Dynamic Method on the Reaction of Rock with Hot Spring Water of the Tamagawa Hot Springs in Japan,
W77-08689 2K

Important Geothermal Sites in Greece, on the Base of Thermomineral Spring Layings, and the Possibilities of Their Exploitation and Utilisation,
W77-08690 4B

Total Energy Use in an Urban-Agricultural Power Plant Complex,
W77-08691 5G

Toxicity of Intermittent Chlorination to Bluegill, Lepomis Macrochirus: Interaction with Temperature,
W77-08761 5C

Effect of Hot Effluent Discharge from the Konakovo Power Plant on the Growth of Bream in Ivan'Kovo Reservoir,
W77-08803 5C

The Effect of Warm Effluent from the Novorossiysk Thermal Power Plan on Zooplankton,
W77-08804 5C

Density and Distribution of Benthos in Lake Keowee, South Carolina,
W77-08818 5C

HEATED WATER POLLUTION
Effect of Temperature and Hydroxy Aluminum Interlayers on the Adsorption of Trace Radioactive Cesium by Sediments Near Water-Cooled Nuclear Reactors,
W77-09024 5B

HEAVY METALS
Nitrification and Heavy Metal Removal in the Activated Sludge Treatment Process,
W77-08623 5D

Heavy Metal Tolerance of Marine Phytoplankton. III. Combined Effects of Copper and Zinc Ions on Cultures of Four Common Species,
W77-08692 5C

An Ecological Model for Heavy Metal Contamination of Crops and Ground Water,
W77-08706 5B

A Study of Heavy Metals in Lake Abbaya, Ethiopia, and the Incidence of Non-Parasitic Elephantiasis,
W77-08774 5A

Studies on Mercury Content in Selected Fish Species from Pomeranian Gulf and Szczecin Firth (Badania nad Zawartoscia Rteci Ogolnej W Wybranych Gatunkach Ryb Zatoki Pomorskiej I),
W77-08781 5C

Production and Heavy Metal Concentration of Vascular Aquatic Macrophytes in Three Eastern Connectituct Rivers,
W77-08814 5B

Suitability of New England Soils in Accepting Waste Effluent - Phase I,
W77-09063 5E

Suitability of New England Soils in Accepting Waste Effluents, Phase II,
W77-09064 5E

Population Response and Heavy Metal Concentrations in Cottontail Rabbits and Small Mammals in Wastewater Irrigated Habitats,
W77-09097 5B

HELIUM
The Helium Isotopes in Thermal Fluids,
W77-08680 5B

HEPTACHLOR
Toxicity of Four Pesticides to Water Fleas and Fathead Minnows,
W77-08948 5C

HERBICIDES
Reactions in the Aqueous Environment of Low Molecular Weight Organic Molecules,
W77-08754 5B

Study on the Post-Mortem Identification of Pollutants in the Fish Killed by Water Pollution: Detection of Arsenic,
W77-08775 5A

Effects of Dipotassium Endothall on Rooted Aquatics and Adult and First Generation Bluegills,
W77-08785 5C

Effects of Sublethal Concentrations of the Herbicide Atrazin on Growth and Reproduction of Daphnia Pulex,
W77-08786 5C

HERRINGS
Studies on Mercury Content in Selected Fish Species from Pomeranian Gulf and Szczecin Firth (Badania nad Zawartoscia Rteci Ogolnej W Wybranych Gatunkach Ryb Zatoki Pomorskiej I),
W77-08781 5C

HISARS
Development of a Hydrologic Information Storage and Retrieval System,
W77-08609 7C

HISARS - Hydrologic Information Storage and Retrieval System - Reference Manual,
W77-08610 7C

HISTORIC FLOODS
Special Flood Hazard Information Report: Missouri and Kansas Rivers, Kansas City, Kansas.
W77-08613 4A

Flood Plain Information: Ohio River, Lawrence County, Ohio.
W77-08614 4A

HOGGARD MILL CREEK (NC)
Studies of the Fish Populations in Two Eastern North Carolina Swamp Streams,
W77-09062 2I

HOSPITAL WASTEWATER REUSE
The Development of a Test for the Potability of Water Treated by a Direct Reuse System,
W77-08758 5A

HOT MINERAL WATER
The Content of Silica in Hot Mineral Waters of France in Relation to Temperature, Sodium Content and Bicarbonates (La Teneur en Silice des eaux Thermominerales de France en Relation Avec la Temperature, la Teneur en Sodium et en Bicarbonates),
W77-08686 2K

HOT SPRINGS
Studies by the Dynamic Method on the Reaction of Rock with Hot Spring Water of the Tamagawa Hot Springs in Japan,
W77-08689 2K

Important Geothermal Sites in Greece, on the Base of Thermomineral Spring Layings, and the Possibilities of Their Exploitation and Utilisation,
W77-08690 4B

HOUSTON-GALVESTON AREA (TEXAS)
Fault Control of Subsidence, Houston, Texas,
W77-08662 4B

HUMAN DISEASES
A Study of Heavy Metals in Lake Abbaya, Ethiopia, and the Incidence of Non-Parasitic Elephantiasis,
W77-08774 5A

HUMAN INFLUENCE
Production and Heavy Metal Concentration of Vascular Aquatic Macrophytes in Three Eastern Connectituct Rivers,
W77-08814 5B

HUMAN INFLUENCE INDEX
Man's Effect on the Fishes of the Upper Shetucket River System,
W77-09061 5C

HUNGARY
Ground Water Budget of the Mountainous Regions of Hungary, (In Hungarian),
W77-08663 2F

Dispersion Measurement on the Danube,
W77-09040 5B

HYDRAULIC DESIGN
The Effect of Surcharging on Discharge Through a Pipe,
W77-08644 8B

HYDRAULIC ENGINEERING
Expansion of the Range of Some Fish Species in Connection with Hydraulic Engineering Construction on the Volga and Acclimatization Works, (In Russian),

Fish Fauna of Lakes of the Lower Reaches of the Zarafshan River and its Fishery Use, (In Russian),
W77-08708 2H

An Evaluation of the National Eutrophication Survey Data,
W77-08710 5C

The Hydrogeologic Regime of Glacial-Terrain Lakes, with Management and Planning Applications,
W77-08724 2F

The Effect of the Impoundment of Lake Kainji, Nigeria, on the Indigenous Species of Mormyrid Fishes,
W77-08772 5C

Effects of Hypolimnetic Aeration on Nitrogen and Phosphorus in a Eutrophic Lake,
W77-08824 5C

The Use and Misuse of Pure Water PVT Properties for Lake Waters,
W77-08840 2H

Inland Waters. Monographs from Limnology and Related Areas, Vol. 26, Part 1. The Zooplankton of Inland Waters,
W77-08861 2H

Transjoen, A Groundwater Influenced Lake with Special Redox and Sulphate Conditions,
W77-09031 2H

A Comparative Study of Organic Carbon and Nutrients in Lake Sediment,
W77-09065 5A

Limnological Investigation of Six Lakes in Southeast Alaska,
W77-09069 7C

Hydrologic Considerations in Dewatering and Refilling Lake Carlton, Orange and Lake Counties, Florida,
W77-09080 5G

LAMINAR FLOW
Flow Regimes in Debris Flow,
W77-09045 2J

LAMINATED ROCK
Rock Type Decides Jetting Economics,
W77-08666 8C

LAND DEVELOPMENT
Legal Battles on the California Coast: A Review of the Rules,
W77-08963 6E

LAND DISPOSAL
Nitrogen Removal from Secondary Effluent by a Laboratory Soil Column,
W77-08607 5B

LAND FORMING
Rykar V Gill (State's Refusal to Allow Upland Owner to Fill Adjacent Marshland Because of Owner's Access to Deep Water by Use of Wharfing Techniques),
W77-09005 6E

LAND MANAGEMENT
The Hydrology of a Small Catchment Basin at Samaru, Nigeria: IV: Assessment of Soil Erosion Under Varied Land Management and Vegetation Cover;
W77-08698 4D

Water as an Environmental Constraint in Land Use Planning,
W77-08721 6G

LAND RECLAMATION
Wettability of Coal-Mine Spoils in Northwestern New Mexico,
W77-09041 5G

LAND SUBSIDENCE
Land Subsidence,
W77-08653 4B

Fault Control of Subsidence, Houston, Texas,
W77-08662 4B

Artificial Recharge for Subsidence Abatement at the NASA-Johnson Space Center, Phase I,
W77-08744 4B

LAND USE
Water as an Environmental Constraint in Land Use Planning,
W77-08721 6G

Integrated Evaluation Programs for Fairfax County, Va.,
W77-08862 6B

Water--An Element of Land-Use and Urban Growth Policies,
W77-08872 6B

Storm Tide Frequency Analysis for the Coast of Georgia,
W77-08914 2L

Legal Battles on the California Coast: A Review of the Rules,
W77-08963 6E

Economic Development and Environmental Quality in the Northeastern Plateau Region of California,
W77-09055 6B

LAND USE PLANNING
Water as an Environmental Constraint in Land Use Planning,
W77-08721 6G

LANDFILLS
Carbon Isotopic Study of the Fate of Landfill Leachate in Groundwater,
W77-08670 5B

The Design of a System for Collecting Leachate from a Lined Landfill Site,
W77-08827 5G

LANDSAT IMAGES
Remote Sensing of Turbidity Plumes in Lake Ontario,
W77-08752 7B

LARVAE
The Influence of Some Pollutants on the Survival of Eggs and Larvae of Two Species of Flatfish, Limanda Yokohamae and Paralichthys olivaceus, (In Japanese),
W77-08782 5C

Effect of the Water-Soluble Fractions of Crude, Refined and Waste Oils on the Embryonic and Larval Stages of the Quahog Clam Mercenaria sp.,
W77-08794 5C

LIBRARY OF THE UNIVERSITY OF ILLINOIS AT URBANA-CHAMPAIGN

The Effect of Warm Effluent from the Novorossiysk Thermal Power Plan on Zooplankton,
W77-08804 5C

ARVICIDE
Methoxychlor Residue Studies in Caged and Wild Fish from the Athabasca River, Alberta, Following a Single Application of Blackfly Larvicide,
W77-08797 5C

EACHATE
The Design of a System for Collecting Leachate from a Lined Landfill Site,
W77-08827 5G

EACHING
Atmospheric Sulfate Additions and Cation Leaching in a Douglas Fir Ecosystem,
W77-08822 2K

EAD
Mussels (Mytilus Sp.) as an Indicator of Lead Pollution,
W77-08693 5C

Effects of Mercury, Cadmium, and Lead Salts on Regeneration and Ecdysis in the Fiddler Crab, UCA Pugilator,
W77-08702 5C

An Ecological Model for Heavy Metal Contamination of Crops and Ground Water,
W77-08706 5B

Production and Heavy Metal Concentration of Vascular Aquatic Macrophytes in Three Eastern Connecticut Rivers,
W77-08814 5B

EASES
Water-Use Leasing Act.
W77-09010 6E

EAVES
Species Differences in Breakdown of Tree Leaves in Streams--Significance for Composition of Stream Communities,
W77-09056 5B

EBANON
Phytoplankton Standing Crop and Sewage Nutrient Enrichment Along the Central Coast of Lebanon,
W77-08762 5C

EGAL ASPECTS
Legal Battles on the California Coast: A Review of the Rules,
W77-08963 6E

Selected Problems in Idaho Ground Water Law,
W77-09049 6E

EGISLATION
As an Incident of National Sovereignty, the United States Has Paramount Rights and Power in the Seabed and Subsoil of the Outer Continental Shelf,
W77-08974 6E

Porter--Cologne Water Quality Control Act.
W77-08978 6E

Energy Plant Siting Legislation,
W77-09050 6E

Policy Innovation and Institutional Fragmentation,
W77-09053 6E

LEPOMIS
Toxicity of Intermittent Chlorination to Bluegill, Lepomis Macrochirus: Interaction with Temperature,
W77-08761 5C

LETHAL LIMIT
Toxicity of Intermittent Chlorination to Bluegill, Lepomis Macrochirus: Interaction with Temperature,
W77-08761 5C

A Pneumatic Dosing Apparatus for Flow-Through Bioassays,
W77-08763 5A

The Residual Oxygen Bioassay: A Rapid Procedure to Predict Effluent Toxicity to Rainbow Trout,
W77-08766 5A

Thermal Acclimation, Upper Temperature Tolerance, and Preferred Temperature of Juvenile Yellowtail Snappers, Ocvurus chrvsurus (Bloch) (Pisces: Lutjanidae),
W77-08769 5C

Method for Determining Acute Toxicity of an Acid Waste and Limiting Permissible Concentration at Boundaries of an Oceanic Mixing Zone,
W77-08771 5C

Toxicity, Accumulation, and Release of Three Polychlorinated Naphthalenes (Halowax 1000, 1013, and 1099) in Postlarval and Adult Grass Shrimp, Palaemonetes Pugio,
W77-08773 5C

The Influence of Some Pollutants on the Survival of Eggs and Larvae of Two Species of Flatfish, Limanda Yokohamae and Paralichtys olivaceus, (In Japanese),
W77-08782 5C

Minimum Oxygen Levels Survived by Stream Invertebrates,
W77-08926 5C

LETHAL TEMPERATURE
Thermal Acclimation, Upper Temperature Tolerance, and Preferred Temperature of Juvenile Yellowtail Snappers, Ocvurus chrvsurus (Bloch) (Pisces: Lutjanidae),
W77-08769 5C

LIBERTY LAKE BASIN (WASH)
Hydrology of Three Recreational Lakes in Eastern Washington State,
W77-08608 5B

LIGHT
Environmental Regulation of Gametogenesis in Scenedesmus Obliquus,
W77-09060 5C

LIME
Dewatering Chemical-Primary Sludges,
W77-08865 5D

LIMNOLOGY
A Primer on Limnology,
W77-08605 2H

Limnological Investigation of Six Lakes in Southeast Alaska,
W77-09069 7C

LINEAR DISPLACEMENT
Retention and Flow Characteristics of Polymer Solutions in Porous Media,
W77-08850 2G

LINEAR PROGRAMMING
Solid Waste Management: A Test of Alternative Strategies Using Optimization Techniques,
W77-08723 5E

LINN COUNTY (IOWA)
Floods in the Big Creek Basin, Linn County, Iowa,
W77-08731 2E

LIQUID JET EDUCTORS (PUMPS)
Liquid Jet Eductors, The 'Pumps' with No Moving Parts,
W77-08671 8C

LIQUID OXYGEN
What's Up with Oxygen/2,
W77-08627 5D

Hyperoxygen Concentrations in the Hypolimnion Produced by Injection of Liquid Oxygen,
W77-09028 5G

LITHOLOGIC LOGS
Geologic Data from Test Drilling in Palm Beach County, Florida Since 1970,
W77-09073 7C

LITTLE LLAGAS CREEK (CA)
Flood Plain Information: Llagas Creek Unit I, Including Edmundson (Little Llagas), Church, San Martin, New, Center, Corralitos, Tennant, Maple, and Foothill Creeks, Santa Clara County, California.
W77-08620 4A

LIVERPOOL BAY (ENGLAND)
Concentrations of PCBs, Dieldrin and DDT Residues in Marine Animals from Liverpool Bay,
W77-08788 5C

LLAGAS CREEK (CALIF)
Flood Plain Information: Llagas Creek Unit I, Including Edmundson (Little Llagas), Church, San Martin, New, Center, Corralitos, Tennant, Maple, and Foothill Creeks, Santa Clara County, California.
W77-08620 4A

LOAD DISTRIBUTION
Urban Stormwater Pollutant Loadings: A Statistical Summary Through 1972,
W77-09046 5B

LOAD TRANSFER
Load Transfer and Hydraulic Fracturing in Zoned Dams,
W77-08857 8B

LOGGING (RECORDING)
Multi-Shot Camera System for Borehole Surveying.
W77-08668 8G

LONGITUDINAL ANALYSIS
Longitudinal Analysis of Change in Levels of Affiliation and Participation in Voluntary Formal Organizations,
W77-09058 6B

LOUISIANA
Records of Wells, Water-Level Measurements, and Drillers' Logs, Red River Valley, Louisiana,
W77-08734 7C

Analyses of Native Water, Bed Material, and Elutriate Samples of Major Louisiana Water Waterways, 1975,
W77-09084 5A

LOW FLOW
Missouri Stream and Springflow Characteristics Low-Flow Frequency and Flow Duration,
W77-08743 2E

LOW-FLOW FREQUENCY
Missouri Stream and Springflow Characteristics Low-Flow Frequency and Flow Duration,
W77-08743 2E

LUMBERING
Hydrologic Changes After Logging in Two Small Oregon Coastal Watersheds,
W77-08746 4C

MADISON LIMESTONE
Report on Preliminary Data for Madison Limestone Test Well No. 1, NE1/4SE1/4 Sec. 15, T. 57 N., R. 65 W., Crook County, Wyoming,
W77-09072 4B

MAINTENANCE MEDIA
Willimantic River Organisms Grown in Media with Natural Substrate Levels as Inocula for Algal Assays,
W77-09091 5C

MAMMALIAN CELL CULTURE
The Development of a Test for the Potability of Water Treated by a Direct Reuse System,
W77-08758 5A

MANAGEMENT
The Management of International Boundary Waters of Canada and the United States: A Comparative Study,
W77-08720 6E

Lake-Shoreland Management Programs: Selected Papers,
W77-08924 2H

MANATI RIVER (PUERTO RICO)
Comprehensive Oceanographic Baseline Study at Barceloneta, Puerto Rico.
W77-08853 5B

MANGANESE
The Behaviour of Dissolved Iron, Manganese and Zinc in the Beaulieu Estuary, S. England,
W77-08701 5B

Adsorption and Vertical Movement of the Zinc and Manganese Ions in Three Types of Soil,
W77-09054 5B

MAPS
Annual Summary of Ground-Water Conditions in Arizona, Spring 1975 to Spring 1976,
W77-08732 7C

Availability of Ground Water in the Middle Merrimack River Basin, Central and Southern New Hampshire,
W77-08733 7C

Limnological Investigation of Six Lakes in Southeast Alaska,
W77-09069 7C

MARINE ALGAE
A Certain Marine Catenate Dinoflagellate Tentatively Applied for Detecting Carcinogens,
W77-08795 5A

Incorporation of Benzathrone into the Nuclei of Gyrodinium sp. and the Heredity of Consequent Mitotic Delays,
W77-08796 5C

MARINE ANIMALS
Ecology of Toxicity in Marine Sponges,
W77-08793 5C

Behavioral Studies on Chemoreception in Balanus hameri,
W77-08799 5C

MARINE BACTERIA
Kinetic Response of Perturbed Marine Nitrification Systems,
W77-08946 5C

MARINE DIESEL OIL
Effects of a Spill of Marine Diesel Oil on the Meiofauna of a Sandy Beach at Picnic Bay, Hong Kong,
W77-08760 5C

MARINE FISH
Concentrations of PCBs, Dieldrin and DDT Residues in Marine Animals from Liverpool Bay,
W77-08788 5C

MARYLAND
Trace Element Inventory for the Northern Chesapeake Bay with Emphasis on the Influence of Man,
W77-08704 5C

Effects of Economic Development on Water Resources,
W77-09051 5G

MASS TRANSFER
The Use of Packed Beds in Water Pollution Control,
W77-08637 5D

MASSACHUSETTS
Proceedings: The Connecticut River System: A Workshop on Research Needs and Priorities.
W77-08808 6B

Characterization of Urban Runoff in Greenfield, Massachusetts--Phase I,
W77-08939 5B

Commonwealth of Massachusetts V. United States Veteran's Administration (Notice of Suit Provisions of the FWPCA; Federal Common Law Nuisance Actions).
W77-09002 6E

MATERIALS ENGINEERING
Pump Construction Materials,
W77-08675 8G

MATERIALS RECOVERY
New Directions in Ion Exchange,
W77-08719 5D

MATHEMATICAL MODELS
Simulation of Two-Dimensional Contaminant Transport with Isoparametric Hermitian Finite Elements,
W77-08829 5B

Seepage Under Structure on N Strata of Soil,
W77-08843 2F

A Transient, Two-Dimensional, Discrete-Element, Far-Field Model for Thermal Impact Analysis of Power Plant Discharges in Coastal and Offshore Regions. Part I: General Description of the Mathematical Model and Results of an Application,
W77-08905 5B

Analytical Models for the Evaluation of Supplemental Aeration in Texas Estuaries,
W77-08917 5B

A Predictive Phosphorus Model for Lakes - Development and Testing,
W77-08930 5C

A Mathematical Model of Steady Flow in Curved Shallow Channels,
W77-09036 8B

MATHEMATICAL STUDIES
Finite Element Solution of the Two-Dimensional Unsaturated Flow Equation,
W77-08923 2G

Urban Stormwater Pollutant Loadings: A Statistical Summary Through 1972,
W77-09046 5B

MAYFLIES
Polychlorinated Biphenyls in Adult Mayflies (Hexagenia bilineata) from the Upper Mississippi River,
W77-08783 5C

MEADOW PLANTS
Aspects of the Daily and Seasonal Course of Transpiration Intensity in Meadow Plants, (In Russian),
W77-08709 2D

MEASUREMENT
NPDES Permits and Water Analyses.
W77-08953 5G

Real-Time Measurements of Aquatic Nitrogen,
W77-09095 5D

MECHANICAL EQUIPMENT
Tests of Oil Recovery Devices in Broken Ice Fields. Phase I,
W77-08915 5G

MEDITERRANEAN SEA
Sources of Tar Pollution on Israeli Mediterranean Coast,
W77-08852 5B

MEIOFAUNA
Effects of a Spill of Marine Diesel Oil on the Meiofauna of a Sandy Beach at Picnic Bay, Hong Kong,
W77-08760 5C

MEMBRANES
Electrochemical Determinations of Trace Quantities of Phosphate and Nitrate,
W77-08817 5A

MERCURY
The Role of Methylmercury Production in the Transfer of Mercury in a Salt Marsh Ecosystem,
W77-08697 5C

Dose-Dependent Effects of Methylmercury on Limb Regeneration of Newts (Triturus Viridescens),
W77-08699 5C

Methylmercury Induced Injury of Single Barnacle Muscle Fibers,
W77-08700 5C

Effects of Mercury, Cadmium, and Lead Salts on Regeneration and Ecdysis in the Fiddler Crab, UCA Pugilator,
W77-08702 5C

Fate and Biological Effects of Mercury Introduced into Artificial Streams,
W77-08757 5C

A Study of Heavy Metals in Lake Abbaya, Ethiopia, and the Incidence of Non-Parasitic Elephantiasis,
W77-08774 5A

Studies on Mercury Content in Selected Fish Species from Pomeranian Gulf and Szczecin Firth (Badania nad Zawartoscia Rteci Ogolnej W Wybranych Gatunkach Ryb Zatoki Pomorskiej I),
W77-08781 5C

The Influence of Some Pollutants on the Survival of Eggs and Larvae of Two Species of Flatfish, Limanda Yokohamae and Paralichtys olivaceus, (In Japanese),
W77-08782 5C

MERCURY POISONING CHRONIC SYMPTOMS
A Study of Heavy Metals in Lake Abbaya, Ethiopia, and the Incidence of Non-Parasitic Elephantiasis,
W77-08774 5A

METABOLISM
Fate of Labeled n-Alkanes in the Blue Crab and Stripped Mullet,
W77-08764 5C

Effect of Hot Effluent Discharge from the Konakovo Power Plant on the Growth of Bream in Ivan'Kovo Reservoir,
W77-08803 5C

METAL TRANSPORT
Hydrothermal Fluids of Seawater Salinity in Ophiolitic Sulphide Ore Deposits in Cyprus,
W77-08854 2L

METALS
Fate and Biological Effects of Mercury Introduced into Artificial Streams,
W77-08757 5C

Effects of a Parasite, Eubothrium salvelini (Cestoda: Pseudophyllidea), on the Resistance of Juvenile Sockeye Salmon, Oncorhynchus nerka, to Zinc,
W77-08791 5C

Algal Uptake of Copper from Compounds and Its Effect on Salt Metabolism in Algae,
W77-08792 5C

Mineral Distribution Within the Sediments of Pearl Harbor,
W77-08815 2L

Seasonal Patterns of Dissolved Oxygen, Nutrients, and Metals in Natural and Channelized Swamp Streams,
W77-08932 5B

METHOD OF CHARACTERISTICS
Some Computational Aspects of One- and Two-Dimensional Unsteady Flow Simulation by the Method of Characteristics,
W77-08745 2E

METHODOLOGY
Chippewa Flowage Investigations. Part 1: Summary Report,
W77-08725 6B

A Pneumatic Dosing Apparatus for Flow-Through Bioassays,
W77-08763 5A

Application of Temperature Preference Studies to Environmental Impact Assessment,
W77-08768 5C

Laboratory Methods for Determining Temperature Preference,
W77-08770 5C

Method for Determining Acute Toxicity of an Acid Waste and Limiting Permissible Concentration at Boundaries of an Oceanic Mixing Zone,
W77-08771 5C

A Comparison of Methods of Hydrocarbon Analysis of Marine Biota,
W77-08789 5A

New Sampler for Shallow-Water Benthic Macroinvertebrates,
W77-08801 7B

Analysis of Supply and Demand of Urban Oriented Nonreservoir Recreation.
W77-08871 6B

Improved Methodology for Design and Operation of Water Distribution Systems, (Parts I-III),
W77-08940 4A

A Fluorescence Immunoassay Technique for Detecting Organic Environmental Contaminants,
W77-08947 5A

METHOXYCHLOR
Methoxychlor Residue Studies in Caged and Wild Fish from the Athabasca River, Alberta, Following a Single Application of Blackfly Larvicide,
W77-08797 5C

METHYLMERCURY
The Role of Methylmercury Production in the Transfer of Mercury in a Salt Marsh Ecosystem,
W77-08697 5C

Dose-Dependent Effects of Methylmercury on Limb Regeneration of Newts (Triturus Viridescens),
W77-08699 5C

Methylmercury Induced Injury of Single Barnacle Muscle Fibers,
W77-08700 5C

MEXICO
Analog Simulation of the Ground-Water System, Yuma, Arizona,
W77-09067 2F

MICHIGAN
Ground-Water Data for Michigan, 1975,
W77-08753 7C

MICROBIAL DEGRADATION
The Microbial Degradation of Aromatic Petroleum Products,
W77-08759 5B

A Biodegradation of Oil on Water Surfaces,
W77-08909 5G

Environmental Limitations on the Microbial Degradation of Hydrocarbons in Temperate Lakes,
W77-09059 5C

MICROCYSTIS AERUGINOSA
Physical and Chemical Parameters Associated with Phytoplankton Abundance and Periodicity in a Fertilized Fish Pond,
W77-08922 5C

MICROORGANISMS
Controlling Sludge Bulking,
W77-08636 5D

MIDDLE MERRIMACK RIVER BASIN (NH)
Availability of Ground Water in the Middle Merrimack River Basin, Central and Southern New Hampshire,
W77-08733 7C

MIEDZIAN 50
The Effect of Two Pesticides, Miedzian 50 and Gesagard 50, on the Development of Tadpoles of Rana temporaria,
W77-08776 5C

MILITARY RESERVATIONS
United States V Holmes (Waters and Subaqueous Areas Located Within Perimeters of a Military Post),
W77-09008 6E

MINE DRAINAGE
Acid Mine Drainage (AMD) and its Impact on a Small Virginia Stream,
W77-08784 5C

MINE WASTES
Acid Mine Drainage (AMD) and its Impact on a Small Virginia Stream,
W77-08784 5C

Wettability of Coal-Mine Spoils in Northwestern New Mexico,
W77-09041 5G

MINE WATER
Remote Sealing of Mine Passages Containing Flowing Water,
W77-08896 5G

MINERAL DISTRIBUTION
Mineral Distribution Within the Sediments of Pearl Harbor,
W77-08815 2L

MINERAL WATER
The Content of Silica in Hot Mineral Waters of France in Relation to Temperature, Sodium Content and Bicarbonates (La Teneur en Silice des eaux Thermominerales de France en Relation Avec la Temperature, la Teneur en Sodium et en Bicarbonates),
W77-08686 2K

MINERALOGY
Hydrothermal Fluids of Seawater Salinity in Ophiolitic Sulphide Ore Deposits in Cyprus,
W77-08854 2L

MINNESOTA
Paleohydrologic Phenomena Recorded by Lake Sediments,
W77-08750 2J

In Re City of White Bear Lake (Standard for Granting of Permits Under the Minnesota Water Management Law).
W77-08993 6E

MISSISSIPPI
Water for Industrial and Agricultural Development in Attala, Holmes, Humphreys, Issaquena, Sharkey, and Yazoo Counties, Mississippi,
W77-08748 4B

MISSISSIPPI COAST
Testing of a Technique for Remotely Measuring Water Salinity in an Estuarine Environment,
W77-08903 2L

MISSISSIPPI RIVER
Polychlorinated Biphenyls in Adult Mayflies (Hexagenia bilineata) from the Upper Mississippi River,
W77-08783 5C

MISSOURI
Special Flood Hazard Information Report: Missouri and Kansas Rivers, Kansas City, Kansas.
W77-08613 4A

Missouri Stream and Springflow Characteristics Low-Flow Frequency and Flow Duration,
W77-08743 2E

Mc Ilray V Hamilton (Permissive Use of Spring Overflow Defeats Prescriptive Right Claim),
W77-09006 6E

MISSOURI RIVER
Special Flood Hazard Information Report: Missouri and Kansas Rivers, Kansas City, Kansas.
W77-08613 4A

MITOTIC DELAYS
Incorporation of Benzathrone into the Nuclei of Gyrodinium sp. and the Heredity of Consequent Mitotic Delays,
W77-08796 5C

MIXED-OAK FOREST
The Effects of Wastewater Irrigation on the Activities and Movements of Songbirds,
W77-09098 5C

MIXING
Method for Determining Acute Toxicity of an Acid Waste and Limiting Permissible Concentration at Boundaries of an Oceanic Mixing Zone,
W77-08771 5C

Influence of Initial Mixing on Direct Filtration,
W77-08809 5F

MODEL STUDIES
Estimation and Evaluation of Radioactive Contamination Through a Food Web in an Aquatic Ecosystem: I. An Application of the Compartment Model to Transfer of Radioactive Substances Through a Food Chain,
W77-08695 5C

An Ecological Model for Heavy Metal Contamination of Crops and Ground Water,
W77-08706 5B

Guide for Data Collection to Calibrate a Predictive Digital Ground-Water Model of the Unconfined Aquifer in and Near the City of Modesto, California,
W77-08735 2F

Simulations of Water-Level Drawdowns in Proposed Well-Field Areas, Dade County, Florida,
W77-08739 4B

Some Computational Aspects of One- and Two-Dimensional Unsteady Flow Simulation by the Method of Characteristics,
W77-08745 2E

Simulation of Pollutant Movement in Groundwater Aquifers,
W77-08807 5B

Snowmelt: A Two-Dimensional Turbulent Diffusion Model,
W77-08823 2C

Effects of Spatial Variability of Soil Hydraulic Properties in Water Budget Modeling,
W77-08825 2G

The Design of a System for Collecting Leachate from a Lined Landfill Site,
W77-08827 5G

Water and Ice Potentials in Frozen Soils,
W77-08828 2C

Simulation of Two-Dimensional Contaminant Transport with Isoparametric Hermitian Finite Elements,
W77-08829 5B

A Mathematical Model Study of Fresh-Water Lenses,
W77-08837 2F

Digital Model Studies of Steady-State Radial Flow to Partially Penetrating Wells in Alluvial Plains,
W77-08838 2F

Design Efficiency of Stormwater Detention Basins,
W77-08841 4D

Density Currents and Their Applications,
W77-08844 5B

Surface Particle Orbits in Uniform Waves,
W77-08845 8B

Induced Vertical Mixing in a Stratified Impoundment by a Subsurface Warm Water Discharge,
W77-08929 5B

A Predictive Phosphorus Model for Lakes - Development and Testing,
W77-08930 5C

Point Stochastic Analysis of Daily Rainfall Occurrence with Application to Indiana,
W77-08935 2B

Principles of Graphical Gradually Varied Flow Model,
W77-09015 2E

Estimating Wave Generation on Restricted Fetches,
W77-09021 2L

Infiltration Equations for Simple Soil Systems,
W77-09025 2G

Transient Analysis of Phreatic Aquifers Lying Between Two Open Channels,
W77-09026 2F

Multivariate Distributions in Hydrology and River Regulation,

SKIMMING
Skimmer Fence,
W77-08893 5G

SLICKGONE LT2
Some Effects of Oil Dispersants on the Feeding Behaviour of the Brown Shrimp, Crangon crangon,
W77-08790 5C

SLUDGE BULKING
Controlling Sludge Bulking,
W77-08636 5D

SLUDGE DISPOSAL
Sludge Disposal in the North West,
W77-08628 5E

Sludge Incineration,
W77-08717 5E

Soil Testing for Sludge Disposal.
W77-08728 5E

Trickling Filter-Activated Sludge Combinations,
W77-08868 5D

Role of Nitrogen in Activated Sludge Process,
W77-08869 5D

SLUDGE TREATMENT
High Speed Liquid Chromatographic Analysis of Cobalamin Productivity and Distribution in Activated Sewage Sludge Treatment,
W77-08621 5A

Controlling Sludge Bulking,
W77-08636 5D

Sludge Treatment: Problems and Solutions, Part 1,
W77-08640 5D

Trickling Filter-Activated Sludge Combinations,
W77-08868 5D

Plant Size Influence on Performance in Activated Sludge Systems with Application to Regional Wastewater Treatment Planning,
W77-08928 5D

SLUICE GATES
Numerical Solution for Flow Under Sluice Gates,
W77-09012 8B

LIBRARY OF THE UNIVERSITY OF ILLINOIS

SLUMPING (EROSION)
Present-Day Slumping and Erosion Phenomena on Irrigated Lands (Exemplified by Southeastern Ciscaucasia), (In Russian),
W77-08885 2J

SLURRIES
Specialty Cements Can Solve Special Problems,
W77-08664 8F

Additives Tailor Cement to Individual Wells,
W77-08665 8F

Selection of Slurry Pumps for Severe Applications,
W77-08673 8C

SMALL ANIMALS (MAMMALS)
Population Response and Heavy Metal Concentrations in Cottontail Rabbits and Small Mammals in Wastewater Irrigated Habitats,
W77-09097 5B

SMALL WATERSHEDS
Water as an Environmental Constraint in Land Use Planning,
W77-08721 6G

SNAILS
Acid Mine Drainage (AMD) and its Impact on a Small Virginia Stream,
W77-08784 5C

SNAKE RIVER INTERSTATE COMPACT
Snake River Interstate Compact.
W77-08996 6E

SNOWMELT
Flood Hazard Information: Yampa River and Tributaries, Steamboat Springs, Colorado.
W77-08619 4A

Snowmelt: A Two-Dimensional Turbulent Diffusion Model,
W77-08823 2C

An Assessment of Snowpack Depletion-Surface Runoff Relationships on Forested Watersheds,
W77-08933 3B

SNOWPACKS
An Assessment of Snowpack Depletion-Surface Runoff Relationships on Forested Watersheds,
W77-08933 3B

SOCIAL ASPECTS
A Consultant's View of PL 92-500.

SOIL CHEMISTRY
Adsorption and Vertical Movement of the Zinc and Manganese Ions in Three Types of Soil,
W77-09054 5B

SOIL CONTAMINATION
An Ecological Model for Heavy Metal Contamination of Crops and Ground Water,
W77-08706 5B

Movement of Manurial Nitrogen in Cool, Humid Climates,
W77-08819 5B

Simulation of Two-Dimensional Contaminant Transport with Isoparametric Hermitian Finite Elements,
W77-08829 5B

SOIL DISPOSAL FIELDS
Soil Testing for Sludge Disposal.
W77-08728 5E

SOIL EROSION
The Hydrology of a Small Catchment Basin at Samaru, Nigeria: IV: Assessment of Soil Erosion Under Varied Land Management and Vegetation Cover;
W77-08698 4D

SOIL MICROORGANISMS
The Effect of Soil Moisture on the Development of Soil Microflora in Conditions of Field Experiments, (In Slovak),
W77-08696 5B

SOIL MOISTURE
Distribution of Corn Roots in Sandy Soil with a Declining Water Table,
W77-08676 2I

The Effect of Soil Moisture on the Development of Soil Microflora in Conditions of Field Experiments, (In Slovak),
W77-08696 5B

Problems of Optimum Soil Moisture Level: Determination and Control, (In Russian),
W77-08952 2G

SOIL-MOISTURE STRESS
Soil-Moisture Stress as Related to Plant-Moisture Stress in Big Sagebrush,
W77-08751 2G

SOIL PHYSICAL PROPERTIES
Suitability of New England Soils in Accepting Waste Effluents, Phase II,
W77-09064 5E

SOIL PHYSICS
Soil and Rock Strata to Trap, Filter and Store Water for Rural Domestic use,
W77-08821 3B

SOIL PROPERTIES
Effects of Spatial Variability of Soil Hydraulic Properties in Water Budget Modeling,
W77-08825 2G

Infiltration Equations for Simple Soil Systems,
W77-09025 2G

SOIL STRENGTH
Strength of Soil Aggregates: Influence of Size, Density and Clay and Organic Matter Content,
W77-08707 2G

SOIL TESTS
Soil Testing for Sludge Disposal.
W77-08728 5E

SOIL TYPES
Adsorption and Vertical Movement of the Zinc and Manganese Ions in Three Types of Soil,
W77-09054 5B

SOIL WATER MOVEMENT
The Hydrogeologic Regime of Glacial-Terrain Lakes, with Management and Planning Applications,
W77-08724 2F

Flow Characteristics During Infiltration into a Horizontal Sand Column,
W77-08826 2G

Infiltration Equations for Simple Soil Systems,
W77-09025 2G

SOIL-WATER-PLANT RELATIONSHIPS
Soil-Moisture Stress as Related to Plant-Moisture Stress in Big Sagebrush,
W77-08751 2G

SOLAR RADIATION
Ground Water - Solar Heat,
W77-08652 8C

SOLID WASTES
Solid Waste Management: A Test of Alternative Strategies Using Optimization Techniques,
W77-08723 5E

SOLUTES
Solute Travel Times to Wells,
W77-09042 5B

SONG BIRDS
The Effects of Wastewater Irrigation on the Activities and Movements of Songbirds,
W77-09098 5C

SOUTH CAROLINA
Density and Distribution of Benthos in Lake Keowee, South Carolina,
W77-08818 5C

Effect of Temperature and Hydroxy Aluminum Interlayers on the Adsorption of Trace Radioactive Cesium by Sediments Near Water-Cooled Nuclear Reactors,
W77-09024 5B

A Reconnaissance of the Hydrology of the Edisto and Ashepoo Estuaries, South Carolina,
W77-09076 2L

A Reconnaissance of the Hydrology of the Intracoastal Waterway from Bucksport to Little River Inlet, South Carolina,
W77-09077 2L

SOUTHEAST ALASKA
Limnological Investigation of Six Lakes in Southeast Alaska,
W77-09069 7C

SOVEREIGN IMMUNITY
A Rational National Policy on Public Use of the Beaches,
W77-08976 6E

SOXHLET EXTRACTION
A Comparison of Methods of Hydrocarbon Analysis of Marine Biota,
W77-08789 5A

SPECIES COMPOSITION
The Effect of the Impoundment of Lake Kainji, Nigeria, on the Indigenous Species of Mormyrid Fishes,
W77-08772 5C

The Effect of Warm Effluent from the Novorossiysk Thermal Power Plan on Zooplankton,
W77-08804 5C

SPECIFIC GROWTH RATE
Optimal Temperature for Growth of Juvenile Bluegills,
W77-08798 5C

SPECTROSCOPY
Bituminoid Formation in the Mud Sediments of Domestic Sewage, (In Russian),
W77-08618 5A

SPOIL BANKS
Wettability of Coal-Mine Spoils in Northwestern New Mexico,
W77-09041 5G

SPONGE SPECIES
Ecology of Toxicity in Marine Sponges,
W77-08793 5C

SPONGES
Ecology of Toxicity in Marine Sponges,
W77-08793 5C

SPRING WATERS
Mc Ilray V Hamilton (Permissive Use of Spring Overflow Defeats Prescriptive Right Claim),
W77-09006 6E

SPRINKLER IRRIGATION
Easily Movable Irrigation Sprinkler System,
W77-08880 3F

Irrigation Sprinkling Apparatus with Adjustable Ground Contacting Elements,
W77-08886 3F

Rotary Water Sprinkler,
W77-08888 3F

Sprinkler Having Improved Water Distribution,
W77-08899 3F

ST LAWRENCE RIVER
Oceanographic Features, Currents, and Transport in Cabot Strait,
W77-08851 2L

STABILIZATION
Dune Stabilization with Panicum Amarum Along the North Carolina Coast,
W77-08908 2L

STANDARDS
In Re City of White Bear Lake (Standard for Granting of Permits Under the Minnesota Water Management Law).
W77-08993 6E

STANDING CROPS
Phytoplankton Standing Crop and Sewage Nutrient Enrichment Along the Central Coast of Lebanon,
W77-08762 5C

STATE GOVERNMENTS
PL 92-500: New Federalism or Federal Takeover,
W77-08972 6E

STATISTICAL METHODS
Missouri Stream and Springflow Characteristics Low-Flow Frequency and Flow Duration,
W77-08743 2E

Systematic Identification of DO-BOD Model Structure,
W77-08866 5B

STATISTICAL MODELS
Point Stochastic Analysis of Daily Rainfall Occurrence with Application to Indiana,
W77-08935 2B

STEAMBOAT SPRINGS (CO)
Flood Hazard Information: Yampa River and Tributaries, Steamboat Springs, Colorado.
W77-08619 4A

STEEL
Effluent Guidelines and Standards for Iron and Steel Manufacturing Point Source Category.
W77-08986 5G

STEEL PIPES
Drill String Makeup, Past, Present, Future,
W77-08648 8C

STOCHASTIC PROCESSES
Point Stochastic Analysis of Daily Rainfall Occurrence with Application to Indiana,
W77-08935 2B

STORAGE
Prediction of Nitrogen Transformations in the Storage Lagoon of a Land Treatment System,
W77-08624 5D

STORAGE TANKS
Seismic Design of Liquid-Storage Tanks,
W77-08859 8D

STORM DRAINS
The Effect of Surcharging on Discharge Through a Pipe,
W77-08644 8B

STORM RUNOFF
Quantitative and Qualitative Implications of Urban Storm Runoff Abatement Measures,
W77-08602 5G

Urban Stormwater Pollutant Loadings: A Statistical Summary Through 1972,
W77-09046 5B

STORM TIDES
Storm Tide Frequency Analysis for the Coast of Georgia,
W77-08914 2E

STORM WATER
Quantitative and Qualitative Implications o Urban Storm Runoff Abatement Measures,
W77-08602 5C

STORM WATER COMPOSITION
Urban Stormwater Pollutant Loadings: A Statistical Summary Through 1972,
W77-09046 5E

STRAITS
Oceanographic Features, Currents, and Trans port in Cabot Strait,
W77-08851 2E

STRATIFICATION
Seepage Under Structure on N Strata of Soil,
W77-08843 2E

Induced Vertical Mixing in a Stratified Im poundment by a Subsurface Warm Wate Discharge,
W77-08929 5E

STRATIFIED WATER COLUMN
Mineral Distribution Within the Sediments o Pearl Harbor,
W77-08815 2E

STRATIGRAPHY
Study of an Ice Core to the Bedrock in the Ac cumulation Zone of an Alpine Glacier,
W77-08846 2C

STREAM-AQUIFER INTERACTIONS
Integral Equation for the Description o Stream-Aquifer Interaction,
W77-09092 2E

STREAM CHANNELIZATION
Effects of Stream Channelization on Bottom land and Swamp Forest Ecosystems,
W77-08920 4A

STREAM GAGES
A Review of Velocity-Measuring Devices,
W77-09085 7E

STREAM MODELING
Nonlinear Estimation in Stream Quality Mode ing,
W77-09047 5E

STREAMFLOW
Floods in the Big Creek Basin, Linn County Iowa,
W77-08731 2E

Outline of the Water Resources of the Satu Creek Basin, Yakima Indian Reservation Washington,
W77-08740 4E

Hydrologic Changes After Logging in Tw Small Oregon Coastal Watersheds,
W77-08746 4C

Time-of-Travel Study, Black River from Lyon Falls to Dexter, New York,
W77-08747 4A

STREAMS
Indiana Stream-Temperature Characteristics,
W77-08755 7C

Qualitative and Quantitative Changes in the Benthic Fauna of a Trout Stream, the Couze Pavin Puy-De-Dome, Caused by Agricultural and Urban Pollution, (In French),
W77-08955 5C

Chemical Character of Headwater Streams in Vermont and New Hampshire,
W77-09027 2K

STREPTOCOCCUS
The Effect of the Willimantic Sewage Treatment Plant on the Microflora and Metabolism of the Shetucket River,
W77-09094 5C

STRESS
Toxicity of Intermittent Chlorination to Bluegill, Lepomis Macrochirus: Interaction with Temperature,
W77-08761 5C

STRIP MINE WASTES
Wettability of Coal-Mine Spoils in Northwestern New Mexico,
W77-09041 5G

SUBLETHAL EFFECTS
Toxicity of Intermittent Chlorination to Bluegill, Lepomis Macrochirus: Interaction with Temperature,
W77-08761 5C

Effects of Sublethal Concentrations of the Herbicide Atrazin on Growth and Reproduction of Daphnia Pulex,
W77-08786 5C

SUBMARINE CANYONS
Current-Meter Recordings of Low-Speed Turbidity Currents,
W77-08847 2L

Wave Refraction Diagrams for the Baltimore Canyon Region of the Mid-Atlantic Continental Shelf Computed by Using Three Bottom Topography Approximation Techniques,
W77-08912 2L

SUBMERGED LANDS
Florida's Sovereignty Submerged Lands: What Are They, Who Owns Them and Where is the Boundary,
W77-08951 6E

SUBMERGED LANDS ACT
As an Incident of National Sovereignty, the United States Has Paramount Rights and Power in the Seabed and Subsoil of the Outer Continental Shelf,
W77-08974 6E

SUBMERSIBLE ELECTRIC MOTORS
Self-Pressurizing Seals Keep Submersible Motors Dry,
W77-08672 8C

SUBMERSIBLE PUMPS
Self-Pressurizing Seals Keep Submersible Motors Dry,
W77-08672 8C

SUBSURFACE WATER
Remote Sealing of Mine Passages Containing Flowing Water,
W77-08896 5G

SUBURBAN DRAINAGE
Network Characteristics in Suburbanizing Streams,
W77-08830 4C

SULFATES
The Influence of Some Pollutants on the Survival of Eggs and Larvae of Two Species of Flatfish, Limanda Yokohamae and Paralichtys olivaceus, (In Japanese),
W77-08782 5C

Transjoen, A Groundwater Influenced Lake with Special Redox and Sulphate Conditions,
W77-09031 2H

SULFIDES
Hydrothermal Fluids of Seawater Salinity in Ophiolitic Sulphide Ore Deposits in Cyprus,
W77-08854 2L

SUNFISHES
Toxicity of Intermittent Chlorination to Bluegill, Lepomis Macrochirus: Interaction with Temperature,
W77-08761 5C

Effects of Dipotassium Endothall on Rooted Aquatics and Adult and First Generation Bluegills,
W77-08785 5C

Optimal Temperature for Growth of Juvenile Bluegills,
W77-08798 5C

SUPERSATURATION
Hyperoxygen Concentrations in the Hypolimnion Produced by Injection of Liquid Oxygen,
W77-09028 5G

SUPERVISORY CONTROL (POWER)
Szeles--Natale, Inc. V Board of Commissioners of Swatara Township, Dauphin County (Flood Control Aided by Land Development Restraints),
W77-08992 6E

SURFACE-GROUNDWATER RELATIONSHIPS
Surface-Groundwater Interactions and the Conjunctive Use of the Water Resources of the Mullica River Basin, New Jersey,
W77-08810 4B

Ground-Water Hydrology of Berkeley County, West Virginia,
W77-09083 4B

Integral Equation for the Description of Stream-Aquifer Interaction,

W77-08770 5C

Optimal Temperature for Growth of Juvenile Bluegills,
W77-08798 5C

THERMAL STUDIES
Indiana Stream-Temperature Characteristics,
W77-08755 7C

THERMAL TOLERANCE
Thermal Acclimation, Upper Temperature Tolerance, and Preferred Temperature of Juvenile Yellowtail Snappers, Ocvurus chrvsurus (Bloch) (Pisces: Lutjanidae),
W77-08769 5C

THERMAL WATER
Thermal and Chemical Problems of Thermal Waters, Symposium.
W77-08677 2K

Some Features of the Geochemistry of Thermal Water in Platform Areas from Experimental Data,
W77-08679 5B

The Helium Isotopes in Thermal Fluids,
W77-08680 5B

Hydrothermal Processes in the Atlantic Ocean Crust, 26 Degrees N,
W77-08681 2K

Geochemistry of Thermal Waters from Various Geothermal Provinces of India,
W77-08682 2K

Temperature and Chemism of Ground Waters in the Western Areas of the East European Platform,
W77-08683 2K

Geochemistry and Origin of Thermal Waters in Poland,
W77-08684 2K

Thermal Waters in Taiwan, A Preliminary Study,
W77-08685 4B

The Content of Silica in Hot Mineral Waters of France in Relation to Temperature, Sodium Content and Bicarbonates (La Teneur en Silice des eaux Thermominerales de France en Relation Avec la Temperature, la Teneur en Sodium et en Bicarbonates),
W77-08686 2K

Study of the Chemical and Gaseous Composition of Thermal Waters of the Eastern Part of the Pannonian Depression (Considerations sur la Composition Chimique et Gazeuse des eaux Thermales de la Partie Orientale de la Depression Pannonique (Roumanie)),
W77-08688 2K

Important Geothermal Sites in Greece, on the Base of Thermomineral Spring Layings, and the Possibilities of Their Exploitation and Utilisation,
W77-08690 4B

Application of Temperature Preference Studies to Environmental Impact Assessment,
W77-08768 5C

THUNDERSTORMS
Trap-Efficiency Investigation Bernalillo Floodwater Retarding Reservoir No. 1 (Piedra Lisa Arroyo) Near Bernalillo, New Mexico, Water Years 1956-1974,
W77-08741 4D

TIDAL EFFECTS
A Reconnaissance of the Hydrology of the Edisto and Ashepoo Estuaries, South Carolina,
W77-09076 2L

TIDAL MARSHES
Wetlands Protection Under the Corps of Engineer's New Dredge and Fill Jurisdiction,
W77-08977 5G

TIDES
Storm Tide Frequency Analysis for the Coast of Georgia,
W77-08914 2L

TISSUE ANALYSIS
Fate of Labeled n-Alkanes in the Blue Crab and Stripped Mullet,
W77-08764 5C

TOADS
The Effect of Two Pesticides, Miedzian 50 and Gesagard 50, on the Development of Tadpoles of Rana temporaria,
W77-08776 5C

TOTAL MERCURY ANALYSES
Fate and Biological Effects of Mercury Introduced into Artificial Streams,
W77-08757 5C

TOTAL ORGANIC CARBON
Characterization of Urban Runoff in Greenfield, Massachusetts--Phase I,
W77-08939 5B

TOTAL ORGANIC CONCENTRATIONS
Reactions in the Aqueous Environment of Low Molecular Weight Organic Molecules,
W77-08754 5B

TOTAL WATERSHED RESPONSE
Quantitative and Qualitative Implications of Urban Storm Runoff Abatement Measures,
W77-08602 5G

TOXIC SPONGE EXTRACT
Ecology of Toxicity in Marine Sponges,
W77-08793 5C

TOXIC SUBSTANCES
The Development of a Test for the Potability of Water Treated by a Direct Reuse System,
W77-08758 5A

TOXICITY
Experimental Data on the Regulation of 1,2-Dibromopropane in Reservoir Water, (In Russian),
W77-08718 5C

The Development of a Test for the Potability of Water Treated by a Direct Reuse System,
W77-08758 5A

Toxicity of Intermittent Chlorination to Bluegill, Lepomis Macrochirus: Interaction with Temperature,
W77-08761 5C

Toxicity to Fish of Flame Retardant Fabrics Immersed in Their Water. Part I,
W77-08765 5C

The Residual Oxygen Bioassay: A Rapid Procedure to Predict Effluent Toxicity to Rainbow Trout,
W77-08766 5A

Method for Determining Acute Toxicity of an Acid Waste and Limiting Permissible Concentration at Boundaries of an Oceanic Mixing Zone,
W77-08771 5C

Toxicity, Accumulation, and Release of Three Polychlorinated Naphthalenes (Halowax 1000, 1013, and 1099) in Postlarval and Adult Grass Shrimp, Palaemonetes Pugio,
W77-08773 5C

The Effect of Two Pesticides, Miedzian 50 and Gesagard 50, on the Development of Tadpoles of Rana temporaria,
W77-08776 5C

The Influence of Some Pollutants on the Survival of Eggs and Larvae of Two Species of Flatfish, Limanda Yokohamae and Paralichtys olivaceus, (In Japanese),
W77-08782 5C

Acid Mine Drainage (AMD) and its Impact on a Small Virginia Stream,
W77-08784 5C

Ecology of Toxicity in Marine Sponges,
W77-08793 5C

Effect of the Water-Soluble Fractions of Crude, Refined and Waste Oils on the Embryonic and Larval Stages of the Quahog Clam Mercenaria sp.,
W77-08794 5C

Methoxychlor Residue Studies in Caged and Wild Fish from the Athabasca River, Alberta, Following a Single Application of Blackfly Larvicide,
W77-08797 5C

Toxicity of Four Pesticides to Water Fleas and Fathead Minnows,
W77-08948 5C

TOXINS
Effects of a Spill of Marine Diesel Oil on the Meiofauna of a Sandy Beach at Picnic Bay, Hong Kong,
W77-08760 5C

A Pneumatic Dosing Apparatus for Flow-Through Bioassays,
W77-08763 5A

Toxicity to Fish of Flame Retardant Fabrics Immersed in Their Water. Part I,
W77-08765 5C

Toxic Pollutant Effluent Standards for Aldrin/Dieldrin, DDT, Endrin, and Toxaphene,
W77-08983 5G

TRACE ELEMENTS
The Distribution of Trace Metals in the Western North Atlantic Off Nova Scotia,
W77-08703 5B

Trace Element Inventory for the Northern Chesapeake Bay with Emphasis on the Influence of Man,
W77-08704 5C

The Use of Ion Exchange Methods to Determine Trace Elements in Natural Waters: IV. Uranium, Cobalt and Cadmium, (In German),
W77-08787 5A

TRACERS
Fate of Labeled n-Alkanes in the Blue Crab and Stripped Mullet,
W77-08764 5C

TRACKING TECHNIQUES
Time-of-Travel Study, Black River from Lyons Falls to Dexter, New York,
W77-08747 4A

TRANSITION FLOW
Performance Characteristics of a Grassed-Waterway Transition,
W77-08849 4D

TRANSJOEN LAKE (NORWAY)
Transjoen, A Groundwater Influenced Lake with Special Redox and Sulphate Conditions,
W77-09031 2H

TRANSPIRATION
Aspects of the Daily and Seasonal Course of Transpiration Intensity in Meadow Plants, (In Russian),
W77-08709 2D

Transpiration Intensity of Meadow Plants, (In Russian),
W77-08714 2D

TRANSPIRATION INTENSITY
Aspects of the Daily and Seasonal Course of Transpiration Intensity in Meadow Plants, (In Russian),
W77-08709 2D

TRANSPORTATION
Economic Role of the Waterway in Western Europe,
W77-08860 4A

Amend the Merchant Marine Act of 1920 (Hearings on S 2422 to Include the Virgin Islands Within the Scope of the Act With Respect to Transportation of Oil and Oil Products).
W77-08982 6E

TRAP EFFICIENCY
Trap-Efficiency Investigation Bernalillo Floodwater Retarding Reservoir No. 1 (Piedra Lisa Arroyo) Near Bernalillo, New Mexico, Water Years 1956-1974,
W77-08741 4D

TRAP RESPONSES
Trap Responses of the Gray Squirrel (Sciurus carolinensis carolinensis), Raccoon (PRocyon lotor lotor), and Opossum (Didelphis virginiana virginiana) to Environmental Factors in Two Swamp Watersheds of Northeastern North Carolina,
W77-08936 6G

TRAPPING
Trap Responses of the Gray Squirrel (Sciurus carolinensis carolinensis), Raccoon (PRocyon lotor lotor), and Opossum (Didelphis virginiana virginiana) to Environmental Factors in Two Swamp Watersheds of Northeastern North Carolina,
W77-08936 6G

TRAVEL TIME
Time-of-Travel Study, Black River from Lyons Falls to Dexter, New York,
W77-08747 4A

Solute Travel Times to Wells,
W77-09042 5B

TREATMENT FACILITIES
What's Up with Oxygen/2,
W77-08627 5D

Advanced Waste Treatment Design Protects Lake Alton,
W77-08631 5G

New Plymouth Sewerage Scheme,
W77-08632 5D

Pretreatment Helps Niagara Cut Costs,
W77-08633 5D

Instrumentation Improves Waste Water Treatment Plant Control,
W77-08642 5D

Plant Size Influence on Performance in Activated Sludge Systems with Application to Regional Wastewater Treatment Planning,
W77-08928 5D

EPA Proposes Untimely Amendments,
W77-08970 5G

TRIANGULAR ROUGHNESS
Resistance of Two Dimensional Triangular Roughness,
W77-09035 8B

TRICKLING FILTERS
Trickling Filter-Activated Sludge Combinations,
W77-08868 5D

TRIFLURALIN
Toxicity of Four Pesticides to Water Fleas and Fathead Minnows,
W77-08948 5C

TRIS
Toxicity to Fish of Flame Retardant Fabrics Immersed in Their Water. Part I,
W77-08765 5C

TROPHIC LEVEL
An Evaluation of the National Eutrophication Survey Data,
W77-08710 5C

TROUT
Effects of Primary Treated and Biologically Stabilized Kraft Mill Effluents on the Production, Biomass and Growth Rates of Juvenile Salmonids in Three Stream Channels,
W77-08921 5C

TUBIFICIDS
Qualitative and Quantitative Changes in the Benthic Fauna of a Trout Stream, the Couze Pavin Puy-De-Dome, Caused by Agricultural and Urban Pollution, (In French),
W77-08955 5C

TURBIDITY CURRENTS
Remote Sensing of Turbidity Plumes in Lake Ontario,
W77-08752 7B

Current-Meter Recordings of Low-Speed Turbidity Currents,
W77-08847 2L

TURBIDITY PLUMES
Remote Sensing of Turbidity Plumes in Lake Ontario,
W77-08752 7B

TURBULENCE
Short Jet Impingement,
W77-09016 8B

A Mathematical Model of Steady Flow in Curved Shallow Channels,
W77-09036 8B

TURBULENT DIFFUSION MODELS
Snowmelt: A Two-Dimensional Turbulent Diffusion Model,
W77-08823 2C

TURBULENT FLOW
Snowmelt: A Two-Dimensional Turbulent Diffusion Model,
W77-08823 2C

TWEEN 80
Some Effects of Oil Dispersants on the Feeding Behaviour of the Brown Shrimp, Crangon crangon,
W77-08790 5C

TWO-MEMBERED ALGAL ASSAY
The Effect of Secondarily Treated Sewage on the Algal Populations of the Williamantic/Shetucket Rivers,
W77-09096 5C

ULTRA-FILTRATION
Method and Apparatus for Purifying Aqueous Streams Contaminated with Organic Materials,
W77-08889 5D

UNDERGROUND STREAMS
Remote Sealing of Mine Passages Containing Flowing Water,
W77-08896 5C

UNDERGROUND WASTE DISPOSAL
Storage of Low-Level Radioactive Wastes in the Ground: Hydrogeologic and Hydrochemical Factors,
W77-09086 5E

UNDERSEEPAGE
Seepage Under Structure on N Strata of Soil,
W77-08843 2E

UNITED NATIONS
Conclusions and Recommendations for the United Nations Water Conference (Preliminary Outline),
W77-08965 6E

UNITED NATIONS WATER CONFERENCE
Conclusions and Recommendations for the United Nations Water Conference (Preliminary Outline),
W77-08965 6E

UNITED STATES
The Management of International Boundary Waters of Canada and the United States: A Comparative Study,
W77-08720 6E

Preliminary Summary of the 1976 Atlantic Margin Coring Project of the U.S. Geological Survey,
W77-09089 2E

UNIVERSAL COUPLINGS
Universal Coupling for Movable Irrigation Pipes,
W77-08875 3F

UNIVERSITY
Water Resources Research Interests in the Colleges and Universities of North Carolina.
W77-08931 9A

UNSATURATED FLOW
Finite Element Solution of the Two-Dimensional Unsaturated Flow Equation,
W77-08923 2G

UNSTEADY FLOW
Some Computational Aspects of One- and Two-Dimensional Unsteady Flow Simulation by the Method of Characteristics,
W77-08745 2E

PPER SHETUCKET RIVER SYSTEM (CONN)
Man's Effect on the Fishes of the Upper Shetucket River System,
W77-09061 5C

PPER THERMAL TOLERANCE
Thermal Acclimation, Upper Temperature Tolerance, and Preferred Temperature of Juvenile Yellowtail Snappers, Ocvurus chrvsurus (Bloch) (Pisces: Lutjanidae),
W77-08769 5C

RANIUM
The Use of Ion Exchange Methods to Determine Trace Elements in Natural Waters: IV. Uranium, Cobalt and Cadmium, (In German),
W77-08787 5A

RBAN AREAS
Sewage Treatment in Developing Countries,
W77-08635 5D

RBAN DRAINAGE
Quantitative and Qualitative Implications of Urban Storm Runoff Abatement Measures,
W77-08602 5G

RBAN GROWTH
Water--An Element of Land-Use and Urban Growth Policies,
W77-08872 6B

RBAN HYDROLOGY
Quantitative and Qualitative Implications of Urban Storm Runoff Abatement Measures,
W77-08602 5G

RBAN RUNOFF
Design Efficiency of Stormwater Detention Basins,
W77-08841 4D

Characterization of Urban Runoff in Greenfield, Massachusetts--Phase I,
W77-08939 5B

Qualitative and Quantitative Changes in the Benthic Fauna of a Trout Stream, the Couze Pavin Puy-De-Dome, Caused by Agricultural and Urban Pollution, (In French),
W77-08955 5C

Urban Stormwater Pollutant Loadings: A Statistical Summary Through 1972,
W77-09046 5B

RBAN RUNOFF MODELS
Quantitative and Qualitative Implications of Urban Storm Runoff Abatement Measures,
W77-08602 5G

RBANIZATION
Quantitative and Qualitative Implications of Urban Storm Runoff Abatement Measures,
W77-08602 5G

Utility Analysis for the Urban Growth Inside the Recharge Zones of the Groundwater Resources of San Antonio, Texas,
W77-08713 6B

Network Characteristics in Suburbanizing Streams,
W77-08830 4C

Seasonal Variations in the Impact of Suburban Development on Runoff Response: Peterborough, Ontario,
W77-08831 4C

Man's Effect on the Fishes of the Upper Shetucket River System,
W77-09061 5C

Flood-Plain Delineation for Difficult Run Basin, Fairfax County, Virginia,
W77-09071 4C

UREAS
Effluent Guidelines and Standards for Fertilizer Manufacturing Point Source Category, Urea and Ammonium Nitrate Subcategory.
W77-08984 5G

USED MOTOR OIL
Effect of the Water-Soluble Fractions of Crude, Refined and Waste Oils on the Embryonic and Larval Stages of the Quahog Clam Mercenaria sp.,
W77-08794 5C

USER CHARGES
User Charges in Inland Navigation Policy,
W77-08604 6C

USSR
Methods Used for Drilling Wells in the Soviet Union,
W77-08659 8C

Effect of the Boundary Surface Between Sea and Fresh Waters on the Distribution of Dissolved Oxygen in the Mouth Region of the Dnieper River,
W77-08832 5B

Some Hydrochemical Characteristics of the Mouth Reaches of the Anabar, Lena, Yana, and Indigirka Rivers,
W77-08833 2L

Effect of Ponds and Small Reservoirs on River Runoff in the Forest-Steppe and Steppe Zones of the Volga Basin,
W77-08834 4A

Effect of Agricultural and Silvicultural Practices on the Runoff from Drainage Basins of the Nizhnedevitskaya Hydrologic Station,
W77-08835 4C

Role of River Runoff and of Water Exchange in the Salinity of the Northern Caspian Sea,
W77-08836 2H

Character of Seepage of Precipitation to the Water Table in the Central Forest Steppe,
W77-09043 4B

USSR (ISELTI RIVER)
Chironomid Fauna of the Upper Course of the Iseti River, (In Russian),
W77-09048 5C

USSR (SOUTHEASTERN CISCAUCASIA)
Present-Day Slumping and Erosion Phenomena on Irrigated Lands (Exemplified by Southeastern Ciscaucasia), (In Russian),
W77-08885 2J

USSR (VINNITSA OBLAST)
Molybdenum Content in the Subsurface Waters of the Vinnitsa Oblast, (In Russian),
W77-08882 2K

UTAH
Provo-Jordan River Parkway Authority.
W77-09009 6E

UTILITIES
Utility Analysis for the Urban Growth Inside the Recharge Zones of the Groundwater Resources of San Antonio, Texas,
W77-08713 6B

VACUUM FILTRATION
Dewatering Chemical-Primary Sludges,
W77-08865 5D

VALVES
Pressure Reducing Valves in Pipe Network Analyses,
W77-08855 8B

VARIABILITY
Aspects of the Daily and Seasonal Course of Transpiration Intensity in Meadow Plants, (In Russian),
W77-08709 2D

VELOCITY
Reaeration and Velocity Prediction for Small Streams,
W77-08867 5B

A Mathematical Model of Steady Flow in Curved Shallow Channels,
W77-09036 8B

A Review of Velocity-Measuring Devices,
W77-09085 7B

VELOCITY MEASUREMENT
Surface Particle Orbits in Uniform Waves,
W77-08845 8B

VERMONT
Chemical Character of Headwater Streams in Vermont and New Hampshire,
W77-09027 2K

VERTICAL ELECTRIC SOUNDINGS TECHNIQUES
Geophysical Exploration for Potable Groundwater Supplies in the Kalahari Gemsbok National Park,
W77-08654 4B

VERTICAL MIGRATION
Induced Vertical Mixing in a Stratified Impoundment by a Subsurface Warm Water Discharge,
W77-08929 5B

VIRGIN ISLANDS
Amend the Merchant Marine Act of 1920 (Hearings on S 2422 to Include the Virgin Islands Within the Scope of the Act With Respect to Transportation of Oil and Oil Products).
W77-08982 6E

VIRGINIA
Acid Mine Drainage (AMD) and its Impact on a Small Virginia Stream,
W77-08784 5C

Integrated Evaluation Programs for Fairfax County, Va.,
W77-08862 6B

United States V 62.61 Acres of Land, More or Less, In City of Virginia Beach, Commonwealth of Virginia (A Compensable Property Right as Might Exist in a Wharf or Pier will not be Found in a Jetty Constructed in Navigable Waters),
W77-08990 6E

VIRUSES
Composting Destroys Pathogens in Sewage Solids,
W77-08641 5E

Parasites and Diseases of Cultured Catfish for the Period July 1, 1972 Through June 20, 1975,
W77-08756 5C

VOLGA BASIN (USSR)
Effect of Ponds and Small Reservoirs on River Runoff in the Forest-Steppe and Steppe Zones of the Volga Basin,
W77-08834 4A

VOLGA RIVER
Role of River Runoff and of Water Exchange in the Salinity of the Northern Caspian Sea,
W77-08836 2H

VOLUMETRIC ANALYSIS
Electrochemical Determinations of Trace Quantities of Phosphate and Nitrate,
W77-08817 5A

WALWORTH COUNTY (WIS)

URS CO., SAN MATEO, CALIF.
Urban Stormwater Pollutant Loadings: A Statistical Summary Through 1972,
W77-09046 5B

UTAH STATE UNIV., LOGAN. DEPT. OF CIVIL AND ENVIRONMENTAL ENGINEERING.
Pressure Reducing Valves in Pipe Network Analyses,
W77-08855 8B

UTAH WATER RESEARCH LAB., LOGAN.
Coupled Dynamic Streamflow-Temperature Models,
W77-09014 2E

An Energy Accounting Evaluation of Several Alternatives for Hydropower and Geothermal Development,
W77-09057 6B

VANTON PUMP AND EQUIPMENT CO., UNION, N.J.
Pump Construction Materials,
W77-08675 8G

VIENNA UNIV. (AUSTRIA). ANALYTISCHES INSTITUT.
The Use of Ion Exchange Methods to Determine Trace Elements in Natural Waters: IV. Uranium, Cobalt and Cadmium, (In German),
W77-08787 5A

VINNITSKII MEDITSINSKII INSTITUT (USSR).
Molybdenum Content in the Subsurface Waters of the Vinnitsa Oblast, (In Russian),
W77-08882 2K

VIRGINIA COMMISSION OF GAME AND INLAND FISHERIES, (RICHMOND).
Minimum Oxygen Levels Survived by Stream Invertebrates,
W77-08926 5C

VIRGINIA POLYTECHNIC INST. AND STATE UNIV., BLACKSBURG. DEPT. OF BIOLOGY.
Toxicity of Intermittent Chlorination to Bluegill, Lepomis Macrochirus: Interaction with Temperature,
W77-08761 5C

VIRGINIA POLYTECHNIC INST. AND STATE UNIV., BLACKSBURG. DEPT. OF SOILS AND WATER.
Effect of Temperature and Hydroxy Aluminum Interlayers on the Adsorption of Trace Radioactive Cesium by Sediments Near Water-Cooled Nuclear Reactors,
W77-09024 5B

VIRGINIA POLYTECHNIC INST. AND STATE UNIV., BLACKSBURG. DEPT. OF URBAN AFFAIRS.
User Charges in Inland Navigation Policy,
W77-08604 6C

VIRGINIA POLYTECHNIC INST. AND STATE UNIV., BLACKSBURG. WATER RESOURCES RESEARCH CENTER.
Water--An Element of Land-Use and Urban Growth Policies,
W77-08872 6B

VIRGINIA POLYTECHNIC INST. STATE UNIV., BLACKSBURG. DEPT. OF CIVIL ENGINEERING.
Acid Mine Drainage (AMD) and its Impact on a Small Virginia Stream,
W77-08784 5C

VSEROSSIISKII NAUCHNO-ISSLEDOVATELSKII INSTITUT PRUDOVOGO RYBNOGO KHOZYAISTVA, MOSCOW (USSR).
Effect of Hot Effluent Discharge from the Konakovo Power Plant on the Growth of Bream in Ivan'Kovo Reservoir,
W77-08803 5C

VSESOYUZNYI NAUCHNO-ISSLEDOVATELSKII INSTITUT GIDROTEKHNIKI I MELIORATSII, MOSCOW (USSR).
Methods Used for Drilling Wells in the Soviet Union,
W77-08659 8C

VYSKUMNY USTAV RASTLINNEJ VYROBY, PIESTANY (CZECHOSLOVAKIA).
The Effect of Soil Moisture on the Development of Soil Microflora in Conditions of Field Experiments, (In Slovak),
W77-08696 5B

WAIKATO UNIV., HAMILTON (NEW ZEALAND). DEPT. OF EARTH SCIENCES.
Grain-Size Parameters of Insoluble Residues in Mixxed Terrigenous-Skeletal Carbonate Sediments and Sedimentary Rocks: Some New Zealand Examples,
W77-08848 2L

WARMAN INTERNATIONAL, INC., MADISON, WIS.
Selection of Slurry Pumps for Severe Applications,
W77-08673 8C

WASHINGTON STATE UNIV., PULLMAN. DEPT. OF CIVIL AND ENVIRONMENTAL ENGINEERING.
Hydrology of Three Recreational Lakes in Eastern Washington State,
W77-08608 5B

WASHINGTON STATE UNIV., PULLMAN. DEPT. OF ENVIRONMENTAL SCIENCE.
A Comparative Study of Organic Carbon and Nutrients in Lake Sediment,
W77-09065 5A

WASHINGTON STATE WATER RESEARCH CENTER, PULLMAN.
Citizen Participation in Water Policy Formation,
W77-08603 6B

WASHINGTON UNIV., SEATTLE. COLL. OF FOREST RESOURCES.
Atmospheric Sulfate Additions and Cation Leaching in a Douglas Fir Ecosystem,
W77-08822 2K

WATER POLLUTION CONTROL FEDERATION, WASHINGTON, D. C.
PL 92-500: A Dose of Chaos,
W77-08959 5G

WATER PURIFICATION ASSOCIATED, CAMBRIDGE, MASS.
New Directions in Ion Exchange,
W77-08719 5D

WATER RESOURCES ENGINEERS, INC., WALNUT CREEK, CALIF.
A Conceptual Representation of the New York Bight Ecosystem,
W77-08900 5B

WATERLOO UNIV. (ONTARIO). DEPT. OF CIVIL ENGINEERING.
Principles of Graphical Gradually Varied Flow Model,
W77-09015 2E

WESTERN CO., HOUSTON, TEX.
Specialty Cements Can Solve Special Problems,
W77-08664 8F

Additives Tailor Cement to Individual Wells,
W77-08665 8F

WESTON ENVIRONMENTAL CONSULTANTS-DESIGNERS, WEST CHESTER, PA.
Get Ready for Dual Water Systems,
W77-08645 5G

WILFRID LAURIER UNIV., WATERLOO(ONTARIO). DEPT. OF BIOLOGY.
Laboratory Methods for Determining Temperature Preference,
W77-08770 5C

WISCONSIN DEPT. OF NATURAL RESOURCES, WOODRUFF.
Effects of Dipotassium Endothall on Rooted Aquatics and Adult and First Generation Bluegills,
W77-08785 5C

WISCONSIN UNIV. EXTENSION, MADISON.
The Hydrogeologic Regime of Glacial-Terrain Lakes, with Management and Planning Applications,
W77-08724 2F

WISCONSIN UNIV. EXTENSION, MADISON; AND WISCONSIN DEPT. OF NATURAL RESOURCES, MADISON.
Chippewa Flowage Investigations. Part 3A: Appendixes.
W77-08726 6B

Chippewa Flowage Investigations. Part 3B: Appendixes.
W77-08727 6B

WISCONSIN UNIV. EXTENSION, MADISON; AND WISCONSIN UNIV., MADISON. INLAND LAKES RENEWAL AND MANAGEMENT DEMONSTRATION PROJECT.
Chippewa Flowage Investigations. Part 1: Summary Report,
W77-08725 6B

WISCONSIN UNIV.-MADISON. DEPT. OF ANATOMY; AND WISCONSIN UNIV.-MADISON. DEPT. OF PATHOLOGY.
Dose-Dependent Effects of Methylmercury on Limb Regeneration of Newts (Triturus Viridescens),
W77-08699 5C

WISCONSIN UNIV.-MADISON. DEPT. OF BACTERIOLOGY.
Environmental Limitations on the Microbial Degradation of Hydrocarbons in Temperate Lakes,
W77-09059 5C

WISCONSIN UNIV., MADISON. DEPT. OF PHYSIOLOGY; AND WISCONSIN UNIV., MADISON. DEPT. OF MEDICINE.
Methylmercury Induced Injury of Single Barnacle Muscle Fibers,
W77-08700 5C

WISCONSIN UNIVERSITY, MADISON. DEPARTMENT OF CIVIL AND ENVIRONMENTAL ENGINEERING.
Induced Vertical Mixing in a Stratified Impoundment by a Subsurface Warm Water Discharge,
W77-08929 5B

YALE UNIV., NEW HAVEN. SCHOOL OF MEDICINE.
Physiological and Behavioral Reactions of Fishes to Temperature Change,
W77-08802 5C

LIBRARY U. OF I. URBANA-CHAMPAIGN

LIBRARY U. OF I. URBANA-CHAMPAIGN

LIBRARY U. OF I. URBANA-CHAMPAIGN

CENTERS OF COMPETENCE AND THEIR SUBJECT COVERAGE

- Ground and surface water hydrology at the Illinois State Water Survey.
- Metropolitan water resources planning and management at the Center for Urban and Regional Studies of University of North Carolina.
- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Center of the University of Wisconsin.
- Eutrophication at the Water Resources Center of the University of Wisconsin.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.
- Water well construction technology at the National Water Well Association.
- Water-related aspects of nuclear radiation and safety at the Oak Ridge National Laboratory.
- Water resource aspects of the pulp and paper industry at the Institute of Paper Chemistry.

Supported by the Environmental Protection Agency in cooperation with WRSIC

- Effect on water quality of irrigation return flows at the Department of Agricultural Engineering of Colorado State University.
- Agricultural livestock waste at East Central State College, Oklahoma.
- Municipal wastewater treatment technology at the Franklin Institute Research Laboratories.

Subject Fields

1 NATURE OF WATER

2 WATER CYCLE

3 WATER SUPPLY AUGMENTATION AND CONSERVATION

4 WATER QUANTITY MANAGEMENT AND CONTROL

5 WATER QUALITY MANAGEMENT AND PROTECTION

6 WATER RESOURCES PLANNING

7 RESOURCES DATA

8 ENGINEERING WORKS

9 MANPOWER, GRANTS, AND FACILITIES

10 SCIENTIFIC AND TECHNICAL INFORMATION
